The system of long distance transmission as employed by the General Electric company is that of using generators which give a potential of about 1,000 volts, and large transformers adapted to raise the potential to 5,000 volts or higher. The current thus transformed is transmitted over wires supported upon oil insulators, to the distant receiving point, and is there re-transformed to a lower potential. The line insulators employed consists of a wide glass cup with an inner flange which dips into a ring shaped glass oil cup threaded onto the insulator pin. This construction effectually prevents any leakage of current from the wire to the supports, even in wet weather. The transformers are the same as the standard type "F" transformer except in the method of winding and insulating coils The use of oil in this long distance transmission apparatus is considered extremely desirable because of the high potential of the "step-up" circuit; and the protection it affords against injury to the insulation of the coils can not be overestimated.

Both the primary and secondary coils of the long distance transformers are so wound as to secure the greatest possible inductive effect without any sacrifice of insulation. Mica is freely used, and the greatest care is taken both in winding and assembling to make the insulation as perfect as possible. This insulation is in all cases tested to withstand an alternating potential difference of at least 10,000 volts. The transformers are alike, with the exception of a modification in the winding, whether intended for "step-up" or "step-down" work, the primary of the "step-up" corresponding to the secondary of the "step-down." The standard size is 25,000 watt capacity, and larger sizes will be built if desired. It is not considered advisable, however, to build smaller sizes than this.

CORRESPONDENCE.

New York Notes.

NEW YORK, April 8.—The plans of the Manhattan company for an extension of its "L" system were all but approved by the Rapid Transit commission, and but for the uncompromising opposition of Commissioner Starin would in all probability been accepted. Now, however, there seems to be considerable doubt, and already Manhattan stock has felt the effect of this opposition. Mr. Starin's statement that he had assurances from capitalists that they would invest $15,000,000 in an underground system for rapid transit was at first ridiculed by the Manhattan's advocates, but on Saturday last it was found that these capitalists were in reality some of the city's wealthiest men.

In the meantime the Manhattan company continues to push its claims. Three of the rapid transit commissioners, Messrs. Spencer, Inman and Bushe, are on record in favor of the Spencer-Bushe plan, which calls for an elevated extension from the Manhattan at 129th street through the boulevard to 170th street and thence by the Kingsbridge road to the city limits. The other two commissioners, Messrs. Holloway and Starin, voted against this plan, because as they said, they were opposed to the use of the boulevard. Mr. Holloway admitted that he might withdraw his objection if it should appear that a majority of the boulevard property owners were not opposed to the road.

Since this announcement he has been deluged with letters from property owners on the boulevard petitioning him to vote for the extension of the "L" system. The *Herald* last week undertook to secure an expression of opinion from property owners. It was not possible to trace within a limited time the owners of every foot of abutting property from 108th to 170th street, but the canvassers succeeded in finding and polling the owners of more than eighty-six per cent. of the entire frontage. Of these, nearly eighty-three per cent. express themselves as either in favor of or not opposed to an elevated road in that part of the boulevard. This constitutes more than seventy-one per cent. of the entire ownership from 108th to 170th street, a distance of more than 3 miles, and shows only thirteen per cent. of all to be opposed to such a structure. The greater part of this small percentage represents Columbia College and Trinity Cemetery. Concerning the opposition from the advocates of underground roads, the *Herald* says editorially.

Relief is urgently needed at once, and must be provided at once. Rapid transit for the future will come in good time. We can wait for that. Rapid transit for the present is a pressing necessity. It must be provided first. It demands immediate attention. The people want the commissioners to give them rapid transit at once, before taking up a scheme which promises no relief for ten or fifteen years.

The legislative committee considering the bill providing for a reduction of telephone rates in this city held an important meeting last Thursday. G. Waldo Smith, appearing for the advocates of the measure, said that there could be no question that the telephone companies were subject to legislative control, as the gas and railway companies were. The telephone company of New York city began by charging $60 a year, and had increased its charge until it is now $240. He had investigated telephone charges in Europe personally, and had found that they were as follows: London, $100; Paris, $80; Berlin, $80; Naples, $25; Rome, $20; and Switzerland from $19 to $24. The net profits of the Metropolitan company last year were about $3,400,000.

The Metropolitan company presented the following statement as its argument against the bill:

The annual net earnings of the telephone business in New York city for the past two years have not averaged six per cent. per annum on the actual cash capital invested in the plant. In the investment above referred to no real estate or other property not necessary to the safe and successful operation of the business has been included. The dividends which have been paid upon the capital stock of the telephone company since its organization average less than 7½ per cent. per year. The capital is not watered. The management aims to furnish such an equipment and such an organization as will best supply the best attainable telephone service. Subscribers are supplied with metallic circuit equipment and service for $150 per year or with a special direct line for $240 per year, and they are at liberty to select whichever of these classes best suits the requirements of their business. Every subscriber who has a metallic circuit equipment can talk from his own office to all points reached by the long distance lines. This is a facility not attempted to be furnished in any foreign city. A large number of the public stations have been established at convenient points, from each of which communication with the entire telephone system may be obtained upon the payment of a small fee for each communication. It is, therefore, not necessary for any one to become a regular subscriber to obtain the benefits of the telephone service. The average daily use of the telephone by each subscriber in New York city is very much larger than in any other city in the world. The actual cost to the company of maintaining telephone service in New York city per subscriber is vastly greater than that in any other city in the world. There are many very large items of expense necessarily incurred in furnishing the service in New York city which do not appear at all in the cost of operation in smaller places, and there is no single item of expense which is not much larger, per subscriber, in New York than in other places. The rates charged for telephone service in New York city are no higher—whether considered in relation to the benefits obtained by the subscribers or in relation to the cost of furnishing the service—than they are in the smaller cities.

The representatives of the subscribers asked that the statements of the company be subjected to a rigorous investigation. "I can assure the committee that there are seven thousand solid business men in the Telephone Subscribers' association," said Mr. Smith; "the other six thousand people who use telephones in New York are of the class that care nothing about the charges. I also call the committe's attention to the Ainsworth report in 1885, which showed that the telephone company made over 116 per cent. net profit. This commitee should at least investigate if it is in doubt as to the facts."

The fire in the car house of the Orange electric line in Newark, April 3d, reported in the last issue of the WESTERN ELECTRICIAN, was most disastrous. Twenty-six cars valued at $3,000 each, two sweepers, and a number of sets of the interchangeable parts of the power machinery were destroyed. The building with its contents was the property of the New Jersey Traction company, and it is estimated that the loss will reach $150,000. Many of the cars were new, some of them never having been used. The loss is largely covered by insurance. The service on the Orange line will be very much crippled by the destruction of the cars until the company can replace them. Even with all the cars in service that the company owned before the fire, the facilities were totally inadequate, and new cars are being added to the equipment in order to accomodate the travel. The cars already ordered will now be hurried forward to completion as quickly as possible.

The application for a franchise for the Nassau Electric Railroad company of Brooklyn was heard by the railroad committee of the Brooklyn Board of Aldermen on the evening of April 7th. The routes asked for are substantially the same as those for which the Kings County electric road, as the Nassau was formerly called, applied some time ago. Protests were made by Assistant District Attorney John F. Clarke, in behalf of the residents of South Fifth street, and by the Brooklyn City Railroad company, which offered $150,000 in cash for a franchise to use the same streets that the Nassau company asks for. James C. Church, counsel for the applicants, said that the Nassau people were prepared to begin work within thirty days of the granting of the franchise. W. F. O.

Northwestern Notations.

MINNEAPOLIS, April 8.—A party of electricians and engineers from Minneapolis paid a visit a few days ago to the plant of the St. Paul Gas Light company to examine the new machinery the company has just put in. A compound engine of 1,300 horse power has been placed in position to run the 18 dynamos in use from 6 P. M. till midnight. Interest centered in a belt encircling one of the big fly wheels which is 6 feet wide, 175 feet 8 inches long and a quarter of an inch thick. It is an endless belt without a rivet, and was made by a Chicago firm. It is the main driving belt of the power house and is used on the 22 foot drive wheel. This wheel is so heavy that after the steam is cut off it continues to spin three-quarters of an hour. The surface on which the belt runs is 73 inches wide.

The St. Paul authorities are considering the advisability of appointing a superintendent of electricity to inspect wires, public and private. The sentiment seems strongly in favor of having such an officer, but the precise relations of such an official to the building inspection department and the extent of his authority are matters in question. The ordinance now pending provides for the careful insulation of all wires, and for the cutting out of all dead or unused wires. This item has been objected to in behalf of the electric companies. The committee is consulting the Chicago ordinance for particulars.

A $400,000 mortgage has been placed on the light and street railway plant and other property of the Winona General Electric company. The mortgage is given to the Old Colony Trust company of Boston. Of the bonds thus secured $100,000 will pay bonds previously issued on the street car plant. One hundred and thirty thousand dollars will be held for extensions and additions to be decided later and $170,000 will be certified and delivered. The company now has apparently all the electric business of Winona in its hands.

Electrical Inspector Deming of Minneapolis in his report for the first quarter of the year figures that there were six "electric" fires during that period, involving a total loss of $1,774.45.

Articles incorporating the Montana Electric company have been filed at Butte, Mont. The capital is $50,000 and the incorporators are John O'Rourke, George T. Schmelzel, Seth B. Smith, W. T. Jackson, V. E. Poissant and C. L. Smith. A general electrical business is contemplated. The new company is a consolidation of two companies previously operating.

Thomas Lowry has increased the wages of a thousand employes of the Twin City Rapid Transit company. It is just announced that the wages of conductors and motormen who have been in the company's employ a year or more will be increased from 17 to 20 cents per hour. Those who have been employed less than a year will get 18 instead of 17 cents. Three years ago the men were all getting 15 cents an hour, and the advance has been voluntarily made.

The St. Paul aldermen have arranged an amended street railway ordinance which it is hoped will go through. It does away with transfers on interurban trips and so may pass muster with the company.

In the case of Dr. S.O. Francis against the Western Union Telegraph company for $4,000 damages on account of a delayed message a verdict for $760 has been returned. Judge Willis held that there could be recovery for mental anguish.

It is reported that negotiations are about closed for the sale of the West Duluth Light & Water company's lighting plant to the Hartman General Electric company of Duluth. N. L. P.

PERSONAL.

Morris M. Meade, city electrician of Pittsburg, Pa., was in Chicago for several days last week.

General Manager P. G. Fiedler, of the Boston Braid Manufacturing company of Boston, was a visitor at the New York office of the WESTERN ELECTRICIAN last week.

James McKearney, formerly electrician at the Southern Hotel, St. Louis, has resigned to accept a position with the Knapp, Selmes, Chandler company of St. Louis. Ernest Arnold has been appointed his successor at the Southern.

F. G. Beach, general superintendent of the Central Union Telephone company, Chicago, has been promoted to the office of general manager of the company. Mr. Beach will make his headquarters at room 1306 Ashland block, Chicago.

D. B. Dean, who has been connected with the McGuire Manufacturing company, Chicago, for the last year, has resigned to accept a position with the Terre Haute Car & Manufacturing company. Mr. Dean will represent that company in Chicago.

L. H. Rogers of Boston, who has been connected with the General Electric company, has been appointed assistant general manager of the Brush Electric company. He has moved his wife and family to Cleveland and will reside there. Mr. Rogers some years ago was connected with the New York office of the Brush company.

Charles N. Black has been appointed assistant superintendent of the Brush Electric company. He is a graduate of Princeton, where he took the regular course, and subsequently a course in electrical engineering under Prof. Brackett. After leaving Princeton three years ago he entered the Brush shops, and by his ability, his energy and good common sense has attained his present position, for which he is well fitted.

Charles W. Phipps has been appointed superintendent of the Brush Electric company in place of F. A. Scheffler, resigned. Mr. Phipps has been connected with the Brush company for a number of years. In 1879 he went to England to install the first English Brush plants. In 1880 he went to Japan and China where he spent three years superintending the construction of a large number of Brush installations. He was subsequently superintendent of construction for the eastern district of the Brush Electric company with headquarters in New York. In 1891 he went to Cleveland as assistant superintendent of the works. Mr. Phipps is a hard worker and a very able and reliable man, and thoroughly competent to fill the important position to which he has been appointed.

NEW INCORPORATIONS.

Courter Electric company, Cobleskill, N. Y.; capital stock, $15,000; manufacturing and using electricity for light, heat and power.

P. Claus Dynamo company, New York, N. Y.; capital stock, $100,000; to manufacture and sell dynamos and electrical machinery.

Delavan Electric Light & Power company, Yorkshire, N. Y.; capital stock, $5,000; to manufacture and use electricity for light, heat and power.

South Milwaukee Light & Power company, Milwaukee, Wis.; capital stock $15,000; establishing light and power plant; F. H. Brice, Milwaukee, Wis.

Universal Electric company, Portland, Me.; capital stock, $500,000; to carry on a general electric business of all kinds; Clarence Hale, Portland, Me.

Consumers' Gas & Electric company of Pasadena, Cal.; capital stock, $100 000; to acquire and operate gas and electric works; T. H. Ward, Los Angeles, Cal.

Western Light & Power company, San Francisco, Cal., Los Angeles, Cal.; capital stock, $500,000; to carry on the business of electricians in every branch; Alfred Bouvier, San Francisco, Cal.

Coleman Battery company, Chicago, Ill.; capital stock, $25,000; to manufacture and deal in electric batteries and appliances, etc.; Robert Burns, 112 Randolph street, Chicago, Ill.

Hammond Cleat & Insulator company, Portland, Me.; capital stock, $100,000; to manufacture and deal in all kinds of electrical supplies and apparatus; Clarence Hale, Portland, Me.

Commercial Electrical Supply company, St. Louis, Mo.; capital stock, $15,000; manufacturing and dealing in electrical supplies; W. F. Carter, 224 Commercial building, St. Louis, Mo.

Newberry Passenger Railway company, Williamsport, Pa.; capital stock, $18,000; constructing and operating an electric railway in Williamsport, Pa.; Wm. B. Lamberton, Harrisburg, Pa.

Union Passenger Railway company, Williamsport, Pa.; capital stock, $3,000; constructing and operating an electric railway in Williamsport, Pa.; Wm. B. Lamberton, Harrisburg, Pa.

Buchanan Power & Electric company, Buchanan, Mich.; capital stock, $100,000; to produce electricity for manufacturing light, heat, etc., in Buchanan; J. G. Holmes, Buchanan, Mich.

Universal Electric company, Portland, Me.; capital stock, $500,000; to carry on the business of an electric lighting, manufacturing and power company; Clarence Hale, Portland Me.

Shereden Terrace Passenger Railway company, Pittsburg, Pa.; capital stock, $12,000; constructing and operating an electric railway in Allegheny county, Pa.; R. C. Duncan, Pittsburg, Pa.

Sterling Motor company, Chicago, Ill.; capital stock, $60,000; to manufacture and deal in all kinds of electrical apparatus and machinery; W. G. McLaughlin, 1072 Fulton street, Chicago, Ill.

Holly Wood & Grand View Passenger Railway company, Williamsport, Pa.; capital stock, $24,000; constructing and operating an electric railway in Williamsport, Pa.; J. H. Levick, Williamsport, Pa.

Mount Vernon Electric Street Railway company, Winton, Pa.; capital stock $24,000; constructing and operating an electric railway in Lackawanna county, Pa.; John R. Jones, Scranton, Pa.

Consumers' Electric & Gas company of Los Angeles, Cal.; capital stock, $1,000,000; to acquire real estate and to build works for generating steam, gas and electricity and to sell the same; T. H. Ward, Los Angeles, Cal.

Citizens' North Side Rapid Transit company, Chicago, Ill.; capital stock, $5,000,000; to construct and operate street railways, electric, elevated, cable or underground, in Chicago, Ill.; William Halleck Jones, 362 Dearborn street, Chicago, Ill.

Seattle Terminal Railway & Warehouse company, Seattle, Wash.; capital stock, $500,000; to do a general elevator, warehouse and grain dealing business, build and equip railways, electric light plants, etc.; Preston, Carr & Preston, Seattle, Wash.

Silver Creek Falls Power & Improvement company, Salem, Ore.; capital stock, $16,000; to own, run, operate, furnish, buy and sell water powers for electric lights, street railways, mills, factories, and for running and operating any other kind of machinery, etc.; N. M. Kaiser, Salem, Ore.

Consolidated Electric company, Chicago, Ill.; capital stock, $50,000; to manufacture and deal in electrical goods and appliances of every kind; to construct and operate electric light and power plants and other electrical plants; Consolidated Electric company, 115 Franklin street, Chicago, Ill.

The Dalles Electric Light, Telephone & Power company, The Dalles, Ore.; capital stock, $50,000; to buy, deal in, operate, maintain and manufacture all kinds of machinery, wires and appliances necessary for the purpose of creating or transferring power into electricity; Mays, Huntington & Wilson, The Dalles, Ore.

Texas City Improvement company, Galveston, Tex.; capital stock, $2,500,000; constructing deep water channel, connecting Gulf of Mexico with Texas City, building street railways near Texas City, mills, gins, cotton compresses, grain elevators at Texas City, navigating steam boats and vessels from Texas City to other points, constructing telegraph and telephone lines, manufacturing gas, light, heat and electric motive power, general manufacturing business and erecting hotel in Texas City; Robert G. Street, Galveston, Tex.

ELECTRIC LIGHTING.

Electric lights are being introduced at Conshohocken, Pa.

The city of Carrollton, Ill., is to have electric lights in the near future.

Lynchburg, Va., is to have an electric lighting plant. The plans are now under consideration.

One thousand eight hundred and fifty towns and cities in the United States are equipped with electric lights.

Watertown, N. Y., has voted to erect and maintain an electric power plant of its own, unless the present company will agree to furnish lights every night in the year at $72 per lamp.

A bill is before the Legislature of Pennsylvania to regulate the charges of electric light companies throughout the state. It provides that no company shall charge a city, town, borough or township more than 25 cents per day for an arc light. The bill is the result of the controversey in Philadelphia, where the city pays 50 cents per night for arc lights.

It is interesting to note that from a few scattering arc lights in 1884 in Philadelphia, Pa., the number has been increased to 2,733 in 1892, and from nothing in the way of underground service in 1884, 80,308 feet of conduit, 369 4 miles of telegraph and telephone wires, and 21.8 miles of electric light cable have been laid by 1893. From 3,449 poles and 441 miles of overhead wires in 1884 the number has been steadily increased to 5.955 poles and 901 miles at the present time.

The Board of Public Works and Affairs of Nashville, Tenn., is advertising for bids for electric lighting. The contract to be let will be for five years, but the city retains the right to terminate it in two years. The maximum price fixed in the specifications is twenty-six cents per light for the first year, and twenty-five cents thereafter. The contract calls for 250 lights to be put up at once, and each bidder must deposit with his bid a certified check for $10,000.

ELECTRIC RAILWAYS.

The Springfield Street Railway company's plant at Springfield, Ill., has been purchased by C. K. Monary, representing Louisville capitalists. It is understood that the plant is to be considerably extended.

A petition is pending in the council of Loraine, O., for a franchise on 14 streets of the city for an electric road. Cleveland and Elyria capitalists are asking for a franchise and contemplate building an electric road via Dover Bay Park, Lake Breeze, Randall's Road and Rock River to a connecting line with Cleveland.

The electric tramway, which has been constructed by Messrs. Siemens & Halske of Berlin in Gross-Lichterfelde, Germany, has been opened for traffic. The same firm is busily engaged upon the construction of an electric tramway at Hanover. An electric tramway is also being considered in the town of Gotha.

Electric street railway consolidation appears to have been inaugurated in Rhode Island. The absorption of the Union railway of Providence by the Narragansett Electric Light company is said to be but the beginning of a movement which is to include all electric roads in the state in one combination. The company in question has already acquired full control of the entire street car service in Providence, and in Cranston, East Providence, Manton, Elmwood and Pawtucket.

To avoid a long detour by highway the Pleasant Valley Electric Railroad company of Pittsburg has built a viaduct across Jack's Run, a small tributary of the Ohio about five miles northwest of the city. The structure carries a double-tracked electric railroad and a toll wagon road and footway. It is 740 feet long and 160 feet above the creek at its highest point. The roadway is 18 feet from curb to curb, and the two sidewalks are each five feet wide. The spans vary from 30 to 96 feet in length, and are each composed of latticed girders 3-foot deep. The floor is made of arches of terra cotta lumber, covered with concrete and asphalt. The viaduct is calculated to sustain, besides its own weight, a live load of 20 pounds per square foot over the whole of the roadway and sidewalks, the floor system to carry 12 ton electric cars, 20 feet long, with a 6 foot wheel base. It was erected by a 100 foot overhanging traveler, which started from one side and erected trestle tower, trusses and floor system in advance of itself.

TELEPHONES.

The Wisconsin Telephone company of Racine has filed articles of incorporation with a capital stock of $500 000. The company intends to operate telephone lines throughout the state with headquarters at Racine.

The telephone company is in trouble at Baltimore. Thomas E. McSberry, the agent of the company, has been arrested on a charge of receiving illegal rates for the rental of telephones, and his case will come up before the grand jury. The company is prepared to contest the validity of the Legislatures's act regulating the rates. Governor Brown will be petitioned to instruct the Attorney-general to take legal steps to force the Chesapeake Potomac Telephone company to carry out the provisions of the law enacted by the last Legislature limiting the rates charged subscribers for instruments.

MISCELLANEOUS.

The General Electrical company has absorbed the street railway and electric light plants of Winona, Minn., and the erection of a large power house will be one of the first acts of the new company.

The Marinette Gas, Electric Light & Street Railway company, of Marinette, Wis., has begun work on the extension of its plant, which will cost in the neighborhood of $25 000. A new Corliss engine and several new dynamos have been added.

A. C. Terry read an interesting paper on "Electricity Practically Applied" before the Buffalo Electrical society on the evening of March 24th. Mr. Terry's article was illustrated by the exhibition and operation of different apparatus applying directly to the advancement made in electricity for domestic use.

In the report of the meeting of the Short Electric Railway company of Cleveland, O., the announcement that William Hazleton, 3d, had been appointed the assistant general manager of the company was inadvertently omitted. Mr. Hazleton has been connected with the Short company for several years.

A Boston correspondent says that a number of Quincy capitalists are forming a stock company to place along the shores of Quincy Bay, particularly at Hough's Neck and Quincy Point, a number of electric boats for the use of pleasure and fishing parties. The intention is to use storage batteries.

The Citizens' Electric Light & Power company of Kokomo, Ind., has purchased the plant of the Kokomo Electric company, consisting of one 45, one 50 and one 35 2,000 candle power arc lamp dynamos, two 80 horse power boilers, one 150 horse power engine and accessories and the entire system of lights and wires already up. The good will and all contracts formerly owned by the Kokomo company, including the contract for lighting the city, are now the property of the Citizens' company, and it will be responsible for the fulfillment of the contracts.

TRADE NEWS.

The Riker Electric Motor company of Brooklyn, has in course of construction a 35 horse power motor to be used in connection with an exhibit at the World's Fair.

The Electric Appliance company, Chicago, has completed its assortment of "O. K." weather-proof and office wires and is now prepared to fill orders of all kinds. These wires have met with deserved success.

General Sales Agent G. J. Jackson, of the Norwich Wire company of New York, is receiving congratulations on a contract recently closed with the Bell Telephone company of Montreal, for several miles of wire for underground conduit in Toronto, Ont.

Charles Blizard, secretary of the Franklin Electric company of New York, manufacturer of the Franklin multipolar accumulator (Irving system) is in Chicago introducing these batteries, for which numerous merits and many advantageous improvements are claimed.

The Bryant Electric company of Bridgeport, Conn., manufacturer of the Bryant switch, is now nicely settled in its new factory, which occupies a three-story building. The company has placed considerable new machinery and with enlarged quarters in all departments will have double the capacity of its old works.

The Ansonia Electric company reports large sales and prosperous business among the electrical people of Montana and the Pacific Coast. Charles W. Cobb, the traveling agent for the company, met with gratifying success during the winter and placed many special orders for shield brand wire and Habirshaw rubber covered wire.

J. C. Chamberlin, general manager of the General Electric Launch company of New York, is sending out a neat pamphlet, descriptive of the many advantages of electric launches, and also giving a very interesting account of the construction of launches made by his company, with important data as to the capacity and cost.

H. M. Nichols, of the Redding Electric company of Boston, was in New York last week for a couple of days, during which time he made several large sales for the "Iona" switch, manufactured by this company. Mr. Nichols will visit Philadelphia, Baltimore, Chicago and several other large cities before his return to Boston.

F. C. Ross, manager of the New York office of the Eddy Electric Manufacturing company of Windsor, Conn., will hereafter be located in the Havemeyer building, Cortlandt, Church and Dey streets. A fine suite of offices has been fitted up and will afford largely increased facilities for conducting the business of that well-known company.

The American Down Draft Boiler company, Woburn, Mass., is now the sole manufacturer of the down draft steam boilers and smoke preventing attachments for ordinary boilers. It has fitted up a shop in Woburn, Mass., and further enlarged the capacity for business so that it is now prepared to give prompt attention to all inquiries and orders in its line.

The Sioux City Electrical Supply company has doubled its foundry capacity, adding two brass, one solder and babbitt and one zinc furnaces. The company is also working a night gang, and reports a splendid trade in electrical brass and zinc. The repair shop is also crowded, rebuilding electrical machinery, making commutators, trolley wheels and other supplies.

Queen & Co., Philadelphia, are making a special feature of their "magnetic vane" ammeters and voltmeters. They are adapted for constant switchboard use, and will render service twenty-four hours per day without disadvantage. A number of the larger manufacturing concerns use these meters for installation work, as they present great advantages in being constant, accurate, durable, and low in price. Circular No. 420, which contains full information concerning these meters, will be mailed by the makers upon application.

The trade will be interested in the illustrated catalogue and price list recently published by the Holtzer-Cabot Electric company, 92 Franklin street, Boston, Mass. The book is quite exhaustive and describes fully the company's line of dynamos, indicators, controllers, switches, etc. Full explanations are contained for special wiring and locating for motors and dynamos. A special feature is made of the company's line of fan motors which is particularly complete and worthy of attention.

The Helios Electric company of Philadelphia has added a large amount of new machinery to facilitate the filling of its orders, but appreciating that it will soon outgrow the present quarters, the company has leased a large factory building at Germantown Junction, a few miles from Philadelphia, where it will move its offices and works July 1st. The new quarters will be filled with new machinery, which will give a capacity of fifty lamps daily. The building is 50 by 225 feet and three stories high. Much credit is due General Manager D. C. Spruance for the energetic manner in which he has pushed this company to the front. He returned last week from an extended trip through the West and South much pleased with the numerous orders he has secured.

The Onondaga Dynamo company of Syracuse, N. Y., has received a very flattering testimonial from E. C. Stearns & Co., manufacturers of hardware specialities. The latter concern was induced some time ago to investigate the merits of the Onondaga company's machines, comparing them with the makes of older companies. As a result of his investigation Stearns & Co. placed an order for one 500 light machine. This gave satisfaction and a second order was given for an auxiliary dynamo of 50 lights capacity and subsequently they substituted one of the plating dynamos of the Onondaga company for another make in their nickel room. All these machines are giving satisfaction, ranging in capacity from 15 to 20 per cent. better than the manufacturers rate them.

BUSINESS.

The Central Electric company, Chicago, is kept busy filling orders. The business in Okonite wire, conduit and general supplies was never so great, and the company's large capacity for taking care of its customers is being tested to the utmost at this time. The new socket recently launched on the market by this company is meeting with favorable results. The company is making a specialty of porcelain branch blocks, cut-outs, etc., and is having an unusual demand. The pin and bracket factory of this company is running night and day, and can scarcely keep up with the demand.

H. Hubbell, manufacturer of machinery and tools, Bridgeport, Conn., has recently enlarged his business in manufacturing horizontal bench tapping machines, but will dispense with the tool part of the works. Of this tapping machine, it may be said that the spindle is driven by two 2-inch belts, running in reverse directions, giving a speed of 1,200 to 1,500 per minute. The reversing of the tap is accomplished by light foot pressure on a treadle, through the means of a lever that actuates a friction cone, covered with a moulded leather surface. For tapping small work the machine is provided with a rest and spindle, fitted to line up with the main spindle, on the end of which gigs or holders may be attached to accommodate various shaped pieces. The spindle is provided with a knurled collar that is grasped by the operator in the process of tapping. If from any cause the tap should be run too far in, or become caught in the work, this collar may be released and allowed to revolve, with the tap and work attached, without danger of breaking the tap or injuring the operator.

F. G. Fuller, formerly with the United States Wire & Cable company, has joined the forces of the Washburn & Moen Manufacturing company, and will give his attention to the insulated wire and cable department. Mr. Fuller is now in Chicago and will remain here until after the opening of the World's Fair. Mr. Fuller will make a specialty of pushing the salamander wire which his company is manufacturing. This wire has Para rubber insulation, is fireproof and is specially designed for inside wiring in damp places. It has been submitted to many severe tests and has in every case given satisfaction. One of these made for the information of insurance inspectors was conducted in the following manner: Several smooth sample boards were prepared, each having arranged upon it samples of various well known electric wires, one sample upon each board being the salamander wire. All samples upon the boards had the same size conductor, and were carefully wired together into a circuit, the plan being to test them in comparison, and under the same conditions. These sample boards represented sixteen leading makes of insulated wires, several of them being claimed by their makers to be fireproof. Current was applied and maintained until the conductor was first brought to a red heat, then a white heat, and in some cases, melted. Under this intense heat, every one of these samples except the salamander was wholly destroyed, in several instances setting fire to the board and blazing all around the salamander, but in no case did sufficient heat escape through the salamander covering to discolor the board beneath it.

ELECTRICAL PATENTS.

Issued April 4, 1893.

494,562. Telautograph. Elisha Gray, Highland Park, Ill.

494,565. Controlling Switch for Electric Motors. Warren S. Hill, Boston, Mass.

494,585. Means for Electrically Heating Crucibles. Willis Mitchell, Malden, Mass.

The crucible consists of two insulated parts made of electrical conducting material which are supported in a frame provided with a handle, the frame carrying a pair of contact plates which make contact with the two insulated portions, whereby the contents of the crucible may be heated by the passage of a current from one of the insulated parts to the other through the molten mass.

494,586. Apparatus for Electrically Heating Crucibles. Willis Mitchell, Malden, Mass.

494,587. Electric Coal Mining Machinery. Edmund C. Morgan, Chicago, Ill.

A small motor carries upon one end of its armature shaft a cam which engages with a roller secured to the reciprocating frame carrying the tool, so that the tool may be drawn back by the cam; a spiral spring is put under tension by this act, and upon the release of the roller by the cam acts to impart to the tool a forward stroke

494,596. Police Patrol System. John H. Ring, Lowell, Mass.

494,608. Means for Switching Generators or Motors in or Out of Circuit. Nathan Van Denburgh and Frederick H. Loveridge, Chicago, Ill.

494,610. Electric Switch. George W. Webb, Wilkesharre, Pa.

494,629. Commutator Brush for Dynamos. David W. Dunn, Pittsburg, Pa.

The commutator brush is composed of pulverized carbon and silicate of soda, having sheets of copper gauze interposed between the layers thereof.

494,657. Electric Meter. Milton E. Thompson, Boston, Mass.

The meter is particularly designed for measuring alternating currents, and comprises an armature consisting of a hollow closed conductor of copper or other non-magnetic conducting material, and series coils through which passes the current to be measured, arranged with their common axis at right angles to the common axis of shunt coils, which latter coils are connected as a shunt across the circuit leading to the translating devices. These combined parts constitute an electric motor which develops a torque proportional to the energy passing through the motor.

494,667. Method of Producing Coated Metal Articles. Francis J. Clamer, Philadelphia, Pa.

494,668. Method of Coating Metal Articles. Francis J. Clamer, Philadelphia, Pa.

494,705. Electric Locomotive Regulation. Rudolph M. Hunter, Philadelphia, Pa.

By this method of regulation rheostats for varying the strength of the current and commutated fields for varying the strength of the magnetic field are dispensed with, the regulation being accomplished by varying the counter electromotive force of the motors to permit the passage of the requisite amount of current to produce the proper speed. Two motors are preferably used whose counter electromotive forces may be added or otherwise disposed of to produce the required results. Thus, when the car is starting from rest and a large current is required, the counter electromotive force is reduced to that of one motor, thereby permitting the necessary large flow of current. As the speed increases the counter electromotive force increases, and reduces the current passing through the motors. Thus, within certain speeds, the regulation is automatic, but when the speed reaches that allowable in the streets, the counter electromotive forces of the motors are added, thus opposing the current to such an extent that the required current to maintain the normal speed on the level passes through the motors.

494,710. Telegraph Pole. James W. Carver and Chester E. Carver, Pawlet, Vt.

494,721. Electric Railway Trolley. Edward Martyn, Detroit, Mich.

494,739. Brush Supporter for Dynamo-electric Machines. Axel Ekstroem, Lynn, Mass.

494,750. Switch for Electrical Currents. Henry P. Ball, Schenectady, N. Y.

494,762. Electrical Annunciator. John B. Rogers, Washington, D. C.

494,778. Coin-operated Phonograph. Ellsworth E. Flora, Chicago, Ill.

494,779. Apparatus for Boring Wells. Fulton Gardner, Chicago, Ill.

494,781. Circuit Controller for Electric Motors. Warren S. Hill, Hyde Park, Chicago, Ill.

494,786. Automatic Cut-out for Electric Signaling Boxes. Jacob F. Mehren, Chicago, Ill.

494,787. Automatic Cut-out for Electric Signaling Mechanisms. Jacob F. Mehren, Chicago, Ill.

494,807. Coin-operated Phonograph. Ellsworth E. Flora, Chicago, Ill.

494,827. Voltaic Cell. Edward Weston, Newark, N. J.

The density of the cell, and consequently the electromotive force, is practically independent of temperature changes, a standard cell being thus provided whose electromotive force is always a constant quantity. In the preferred form a saturated solution of cadmium salt in water is used as an electrolyte, and as electrodes an amalgam of cadmium and mercury opposed to an electrode of pure mercury and proto-sulphate of mercury is used. The claim reads: "A voltaic cell, the electromotive force of which is practically independent of temperature changes."

494,828. Electrical Measuring Instrument. Edward Weston, Newark, N. J.

The instrument is of the type in which the strength of an electric current is measured by the expansion of a fine wire, the object of the invention being to reduce the length of the wire from twelve feet or thereabouts to about ten inches. The wire is rigidly secured at one end, the other end being secured to the index after passing around a series of rollers, the wire being thus arranged in an open loop.

494,829. Recording Voltmeter. Edward Weston, Newark, N. J.

The principle of the invention consists in causing a contact arm moving over an elongated body traversed by a current which undergoes thereby a definite fall in voltage, automatically to cut out or introduce into the circuit such fraction of the length of the body as will compensate for the change of voltage occurring in the circuit

494,830. Ground Detector for Electric Circuits. Edward Weston, Newark, N. J.

494,832. Electric Clock. Herman Wubbeler, Beaver Falls, Pa.

494,836. Dynamo-electric Machine. Arthur S. Baxendale, Selangor, Eng.

494,849. Separator for Battery Elements. Chaimsonovitz P. Elieson, New York, N. Y.

494,852. Galvanic Battery. Derrick H. Fitch. Cazenovia, N. Y.

494,856. Electric Generator or Motor. Walter T. Goolden and Llewelyn B. Atkinson, London, Eng.

494,871. Trolley Pole Catcher. Edward L. Langheinz, Brooklyn, N. Y.

494,961. Electrical Measuring Instrument. Adolf Koepoel, Berlin, Germany.

494,964. Galvanometer. Edwin F. Northrup, Ardmore, Ohio.

In this galvanometer all external adjusting magnets are dispensed with, and in place thereof means are provided for adjusting the strength of the moving magnetic field of the system. This is effected by short circuiting, more or less, the magnetic lines of force emanating from the poles of the magnets in the moving system, leaving the system entirely independent of all external magnetic fields other than that of the earth.

494,966. Circuit Closing Clock. Herbert S. Page, Medford, assignor to Edmund D. Spear, Boston, Mass.

494,978. Electric Motor. Francis B. Crocker and Schuyler S. Wheeler, New York, N. Y.

An electric motor carrying a fan upon the end of its armature shaft is supported upon a vertical journal at an angle so that the line of thrust of the fan lies to one side of the vertical pivot, thus causing the motor and fan to revolve around the vertical axis.

494,995. Cut-out for Brush Lamps. Benjamin Adair and Charles H. Klewer, Denver, Colo.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin.

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 6½ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $21,193.-56, with interest from the 22d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,
Receiver of the Milwaukee Electric Railway Company.

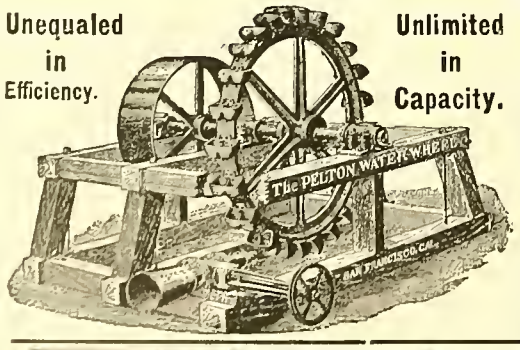
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

WINTER RESORTS OF THE SOUTH.

Jacksonville and Tampa, Florida, and other South Atlantic and Gulf Coast resorts can be reached with but one change of cars from Chicago, and that at Louisville or Cincinnati, where the Monon makes close connections with the L. & N., and Q. & C., Vestibule trains, running through to Florida.

The Monon's day trains are now all equipped with beautiful new Parlor and Dining Cars, while its night trains are made up of Smoking Cars, Day Coaches, and Pullman and Compartment Sleepers, lighted by electricity from headlight to hindermost sleeper.

The Monon has gradually fought its way to the front, making extensive improvements in its roadbed and service, until to-day it is the best equipped line from Chicago to the South, offering its patrons facilities and accommodations second to none in the world, and at rates lower than ever before.

NEW BOOKS! — JUST OUT OF PRESS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. *138 Engravings.*

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. **Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. **42 Illustrations.**

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. *Profusely Illustrated.*

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. **750 Illustrations.**

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. *Profusely Illustrated.*

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nicola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

SEND IN YOUR ORDER.

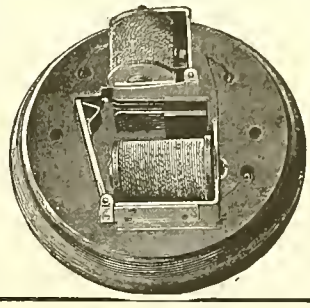
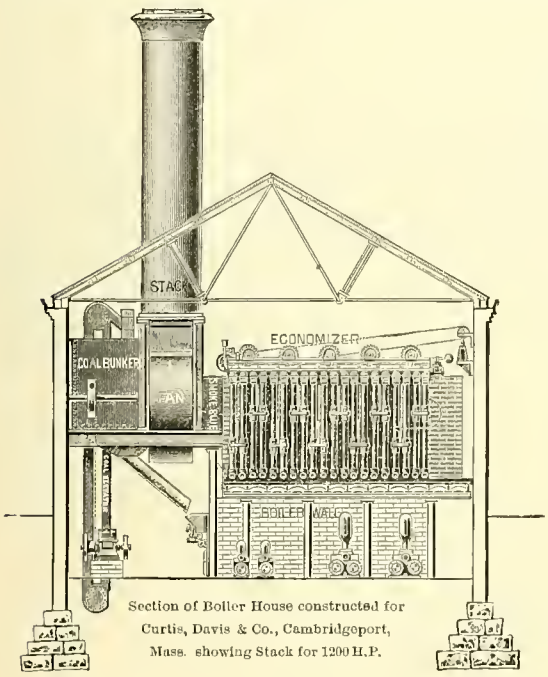
THE SECHRIST AUTOMATIC SWITCH



For controlling Incandescent Lights in private residences by using automatic gas keys and an ordinary battery or shunt circuit.

WANTED:—One good construction firm in each city to represent us.

Apply to
ALBERT SECHRIST,
Manufacturer and Patentee, DENVER, COLO.



Section of Boiler House constructed for Curtis, Davis & Co., Cambridgeport, Mass. showing Stack for 1200 H.P.

BEING A MANUFACTURER you are forced by competition to keep in touch with all genuine economies as soon as their value is proved; hence your Compound Engines, Condensers, Steam Loops, etc., to reduce **the cost of using your Steam.** It is equally important that you should consider every item which enters into **the cost of making your Steam.**

If you are building a new Boiler House, resetting your old boilers or adding new ones:
If your present boilers are short of capacity:
If you wish to raise their evaporative duty to the level of expert hand firing, **and keep it there all the time:**
If you wish smokelessness by **preventing,**—not **concealing** or **consuming** the smoke:
If you wish to preserve your boilers from unequal strains.

YOU WILL CAREFULLY CONSIDER MECHANICAL STOKING.

If you wish to save the whole cost of handling, which in large plants is the greater part of the labor item:
You will equip with simple, cheap and practical

Coal and Ash Handling Machinery.

If you wish to have your fires always under control, irrespective of atmospheric conditions, quality of fuel, or length of run:
If you wish to be independent of extraordinary or sudden demands for steam:
If you wish to save a large portion of the cost of a chimney with its foundations—**and above all,**
If you wish to return into your feed water the greater portion of the heat otherwise sent up the flue to make draft,

You Will Use Mechanical Exhaust Draft and Economizers.

It is a well organized Department of our Business to design and construct Boiler Plants, comprising any or all of the above features, as good judgment may determine. We assume an authority in this branch of Engineering arising from an experience with over 750,000 Horse Power of Boilers equipped with Stokers.

WESTINGHOUSE, CHURCH, KERR & CO., ENGINEERS,

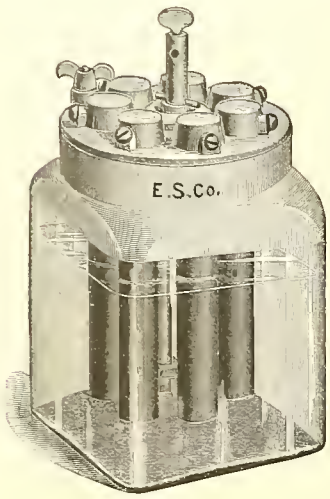
We are Manufacturers of all kinds of

ELECTRICAL SUPPLIES.

THE KNAPP ELECTRICAL WORKS,

54 and 56 Franklin St., Chicago.



No. 670.

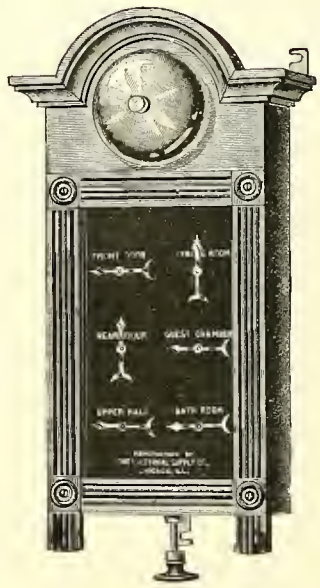
The . . .

Diamond . . .

Carbon Battery

Has the least internal resistance of any open-circuit battery on the market. The carbon pencils are made of the celebrated Diamond Brand. The arrangement of the elements gives the greatest amount of carbon surface.

No Rubber is necessary around the zinc rod to hold it from contact with the carbons. The composition top is so constructed that when "set up" it practically seals the cell, thus preventing evaporation and largely increasing the life of the battery.



No. 682.

The Ansonia Gravity-Needle Annunciator.

Never sticks or catches. **It always works.** Each needle has a double armature, one at each end of the magnet core, so that a very little battery power is necessary to "upset" it. This action combines all the good qualities of the **gravity drop** with the superior looks and neatness of the needle. We make them in all sizes from two needles to 500. Finished in any kind of wood.

No 641.

The Iron and Wood Box Eureka Bells

Are undoubtedly the best made. Simple, perfect in Workmanship, and always **ready to ring.**

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

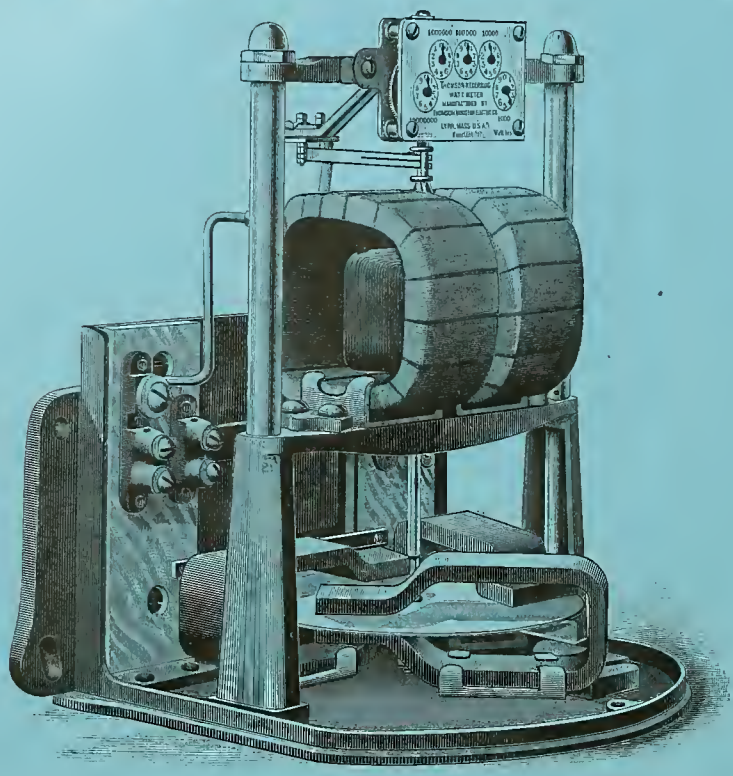
RECORDING WATT-METER.

Accurate Under all Variations of Pressure.

Not Affected by Frequency of Alternations.



For Direct or Alternating Lighting Circuits, or Railway or Stationary Motor Circuits.

THE IDEAL METER--DIRECT READING.

Accurate on One Lamp. Accurate on Full Load. Slow Speed and Long Life.
ENERGY consumed in operation so SMALL as to be PRACTICALLY NEGLIGIBLE.
Applicable to Station Switch-boards. Measuring Entire Output, Primary, Three Wire or Railway.

The only Meter constructed to satisfy the requirements of
ISOLATED PLANTS.

THE PROOF OF ITS SUPERIORITY
Is its Widespread and Increasing Adoption.

In 1892 One Hundred and Fifty Meters were sold for every one sold in 1889, when they were first placed on the market.

OVER 33,000 NOW IN USE.

"STANDARD"
Single Push Button Flush
SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this Switch single pole, double pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere. Single Pole, $1.50.

Liberal discounts to the trade.

THE WESTON STANDARD PORTABLE

DIRECT CURRENT VOLTMETERS AND AMMETERS

Are used in all parts of the civilized world. They are recognized by all authorities as the very best instruments ever produced.

During the past year Mr. Weston has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. ***The New Model*** is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the ***acme*** of perfection, and is destined to become and remain

THE STANDARD PORTABLE INSTRUMENT OF THE WORLD.

We have perfected a larger model of these instruments expressly adapted for use as ***absolute standards*** in stations and laboratories. They are designated as the

Weston Laboratory Standard Voltmeters AND Ammeters.

The scales are about three times the length of the ordinary portable standards, and the instruments are sufficiently sensitive to work to within 1-75 of one per cent. We confidently recommend them as the most convenient and accurate standards known. They are adapted for the most exact work, and will be found thoroughly equal to its requirements.

We make twenty-two ranges of

The Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants. ***We make multipliers for use with these instruments*** to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-Board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

In three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features. They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy voltmeters.*** They are specially designed for switch-board use. We are also making a large line of high grade

Station Ammeters

In ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable, well made and moderate in price.

NOTICE

January 27, 1893.

To the Electrical Trade:

I have this day assigned the entire interest in the Cleveland Switch, Patent No. 391,512, to THE BRYANT ELECTRIC COMPANY, of Bridgeport, Conn., together with the tools, patterns and moulds for making the Switches and Arc Cut-outs formerly manufactured and sold by THE FOREST CITY ELECTRIC WORKS, of Cleveland (Factory, Geneva, Ohio).

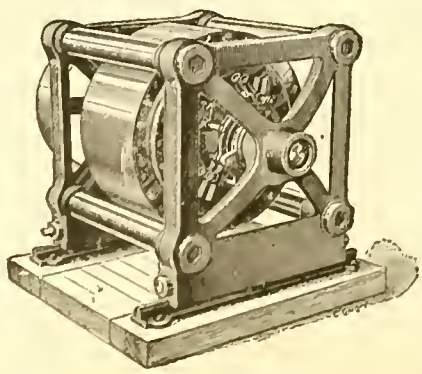
I trust that my former friends and patrons will extend to them the same good will and patronage that they have shown me in the past.

Very respectfully, (Signed) W. B. CLEVELAND.

THE BRYANT ELECTRIC CO. MAKES GOOD GOODS.

The WADDELL-ENTZ COMPANY,

203 BROADWAY, NEW YORK.



Improved Slow-Speed Generators and Motors. "DIRECT-DRIVEN" Slow-Speed Generators for Electric Lighting and Power. Low Running Expense. Insulated Wire and Flexible Cords. Estimates furnished. Isolated Plants a specialty.

EVERY SATURDAY.

Vol. XII. CHICAGO, APRIL 22, 1893. No. 16

Electricity at the World's Fair.

Nearly all of the exhibitors in the electricity building are now busily at work arranging their displays. The Edison "tower of light" in the center of the ground floor is now about ready for the staff, and will be completed in two weeks. The other exhibits of the General Electric company are well under way, and the work is being systematically and rapidly advanced under the efficient direction of Lieut. E. J. Spencer, who has entire charge of the varied interests of this great company.

Several of the General Electric company's exhibits are illustrated in this number. Fig. 1 shows an electric locomotive designed for high speed passenger service, which will be seen in operation on the tracks of the transportation annex. The weight of the locomotive is supported by four driving wheels driven by two flexibly supported water-proof Thomson-Houston motors, supplied with current by means of an overhead trolley. It is equipped with the latest form of series parallel controller, electric air brakes, whistle and automatic safety devices, and was built with the idea of meeting all the requirements of high speed elevated railway passenger service. When it was first proposed to exhibit this locomotive at the World's Fair it was suggested that it be utilized on the elevated electric railroad, but it was discovered that it was too heavy for the structure. However, the locomotive is equally well adapted for surface work, as has been proved by its use on the Boston and Maine railroad, where it has been in service for summer passenger traffic between Lynn and a seashore resort, four miles away. The locomotive weighs about thirty tons, and is designed for a maximum speed of fifty miles an hour.

The graceful arc lamp post shown in Fig. 2 was imported from Europe by the General Electric company purposely for erection on the World's Fair grounds. The pole is of iron, much of the surface covered with beautiful designs wrought in relief, and is 42 feet high. It sustains four Thomson-Houston lamps of 2,000 nominal candle power each. The post was originally erected in Turin, Italy, by the Thomson-Houston International Electric company, and is known as the "Turin jubilee pole." It will be seen at the exposition in the space between the administration building and the terminal railway station. Five other types of foreign decorated posts, ordered by the General Electric company for exhibition at the World's Fair, are shown in Fig. 3. All were erected by the Thomson-Houston International company. Poles *A* and *C* are German, and were designed at the Hamburg office of the company; *B* comes from Bilboa, Spain; *D* from Milan, Italy, and *E* from Paris. These will be shown in the electricity building.

Fig. 4 shows a five ton electric derrick that the General company will show, and Fig. 5 represents the base of the apparatus, showing motor and hoist. The platform upon which the mechanism stands is only 6½ by 7 feet, and the entire apparatus can be controlled by one man.

Among the pavilions thus far erected in the gallery of the electricity building are those of the Commercial Cable company, Roessler-Hasslacher Chemical company, Day's Kerite company, Chicago Electric Wire company, Norwich Insulated Wire company, Ansonia Electric company and Leclanche Battery company. In the German gallery display the following named firms, mostly instrument makers, will make exhibits: Voigtlaender & Son, Brunswick; Franz Schmidt & Haensch, Berlin; C. A. Steinheil's Sons, Munich; Emil Sydow, Berlin; Doeriffel & Faerber, Berlin; Steeg & Reuter, Homburg; Max Kohl, Chemnitz; Schott & Gen, Jena; L. Tesdorpf, Stuttgart; Clemens Riefler, Munich; Paul Bunge, Hamburg; Georg Butenschoen, Hamburg; Albert Ott, Kempten; Paul Gebhardt, Berlin; C. F. Betting, Cassel, Julius Elsner, Goldlauter.

The New York, Boston and Philadelphia circuits of the Long Distance Telephone company have been connected with the World's Fair exchange. Manager A. H. Elmore of the latter sent greetings over the wires to Manager Hovey at the New York office and received congratulations from him. Connections have been made at New York with telephones in other eastern cities. This has been arranged to continue during the exposition, so that at any

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.

time visitors can converse by telephone with relatives, friends or business partners in the cities of the New England and Middle States.

A trial trip of a train on the elevated electric railway at the World's Fair was made on Saturday of last week. A regular train consisting of a motor car and three trailers, with a capacity for 400 passengers, was made up, and several journeys were made around the southern loop. Power was furnished by the Greene 750 horse power engine and General Electric 500 kilowatt generator illustrated in last week's WESTERN ELECTRICIAN. It had been intended to make a run over the entire track, but this was prevented by the fact that the loop station was found to project four inches over the space required for the train, which, of course, prevented farther progress. It was also discovered that a slight improvement was necessary in the device for raising the trolley shoe at switches. As far as the operation of the train itself was concerned, however, everything worked admirably. The motors, with their capacity of over 500 horse power, responded easily to every demand made upon them, and were under complete regulation. The air brakes controlled the cars with ease, and the train was stopped within its own length when going at full speed. In the power station there were no hitches, the big engine and generator taking care of the load thrown upon them without effort. In a few days the changes found necessary in the track construction will be completed, and then the entire circuit of the line will be made. Among those who rode in the cars on Saturday were W. E. Baker, general manager of the road; E. C. Ward, secretary; C. P. Matlack, chief engineer; C. H. Macloskie, electrical engineer; B. J. Arnold, consulting engineer: E. W. Rice, Jr., superintendent of the General Electric Works at Lynn; John Kruesi, superintendent of the General Electric Works at Schenectady; W. H. Knight, superintendent of railway construction at Lynn; F. W. Horne and a number of Chicago newspaper men.

The work of raising the five great arc light coronas for the manufactures building, described in the WESTERN ELECTRICIAN of February 18th, was begun last week, and has attracted much attention. The center electrolier weighs 12 tons and each of the others nine tons. A large force of men, with a complicated system of blocks and tackles, is employed on the work.

The annual report of President Higinbotham for the year ending April 1, 1893, contains a few items of especial interest to the electrical fraternity. Among the miscellaneous receipts, for instance, is one item of $350 for electric lighting and another of $6,419.85 for electric power furnished, while "power and light in suspense" is put down as contributing $7,761. Under the head of general expenses, electric lights and appliances are shown to have cost $54,173.14, telegrams and cablegrams $4,252.45 and telephones $7,936.14. Charged to construction expenses are: Boiler house, $32,908.53; boiler plant, $71,813.09; electrical engineering, $55,793.93; electricity building, $434,123.58; electric plant, $432,736.88; mechanical engineering, $38,809.01; office building for mechanical and electrical department, $10,373.01; police signal boxes, $10,725.59; power plant, machinery hall, $216,100.53. Of the total expenditures of $16,708,826.48 by far the largest amount, $14,043,134.58, went for construction. Aside from its share of this sum the electricity department is charged with $22,813.61. It is interesting to note that on March 31st the total receipts had been $17,496,432.16, leaving a balance of $787,605.68.

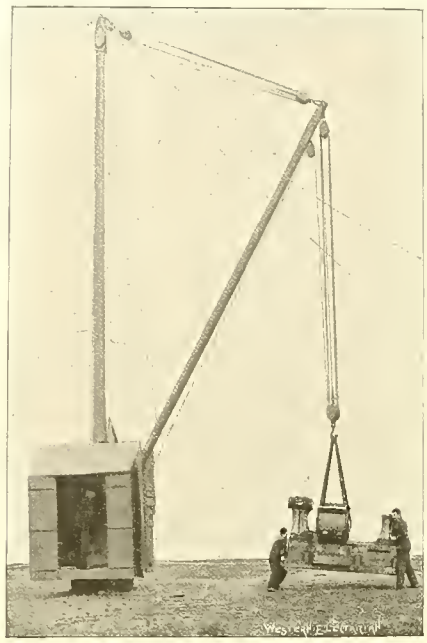

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.

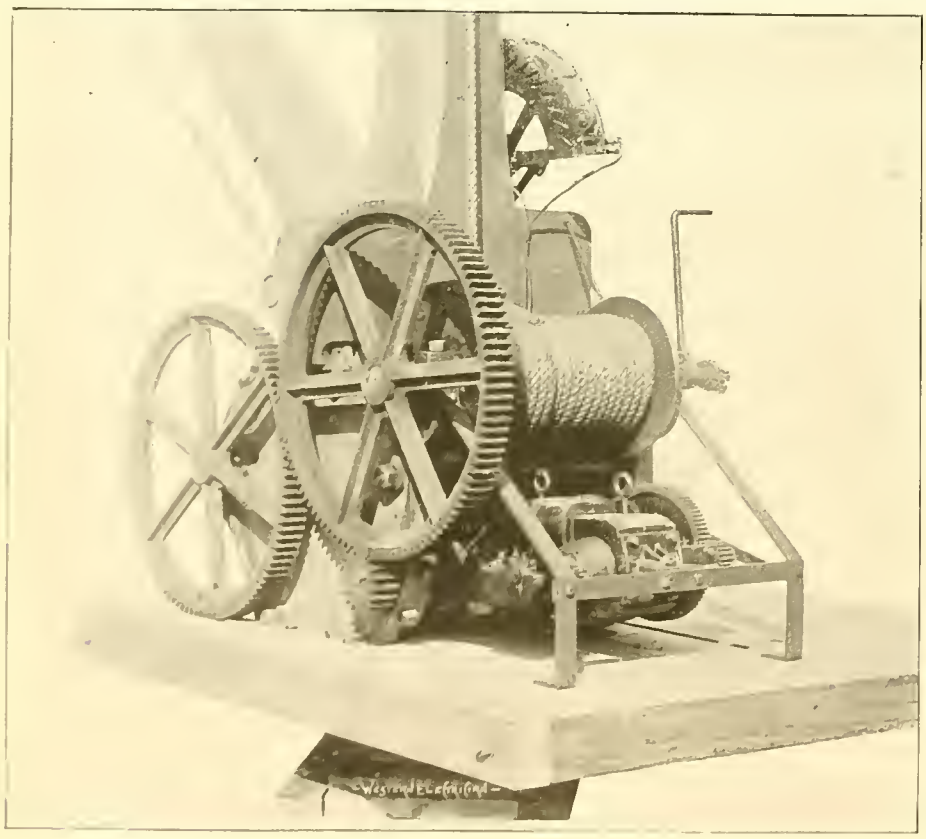

FIG. 5. ELECTRICITY AT THE WORLD'S FAIR.

Engineers will be interested in the announcement that the reception rooms and offices of the general and executive committees of the Associated Engineering Societies of the United States and Canada and of the general committee of the World's Congress Auxiliary on the International Engineering Congress, on and after May 1st, and until the close of the exposition, will be at No. 10 Van Buren street, Chicago. All communications after May 1st should be addressed to, or to the care of, Max E. Schmidt, secretary. Visiting engineers may have their mail thus addressed. The committee rooms of the Associated Societies at the exposition will be situated in the southwest corner of the gallery of the mines and mining building, where the secretary or some of the staff will be present during the exposition to meet visiting engineers.

The E. S. Greeley & Co. is preparing to make an elaborate exhibit on the floor of electricity building. Louis J. Auerbacher is now on the ground looking after this company's display.

One of the Westingbouse 4,000 light alternators has been used for several days in drying out converters. During the winter months a larger number of converters accumulated in machinery hall, and on account of the leaky condition of the roof became covered with snow and ice, which, on melting, leaked into the boxes. An ingenious manner of drying these dampened converters by electricity was advised by General Manager Keller. The secondaries of a number were wired in series with the dynamo and the primary coils short circuited. The potential of the dynamo was then raised sufficiently to send a slightly heavier current through the converters than that which would be employed if the transformers were actually in use under full load. This was kept up until the converters were thoroughly dried by the heat, and then another batch was put in circuit and the operation repeated.

The Westinghouse company expects to have nearly two thousand alternating current arc lamps on the grounds. A large number of these will be in Midway Plaisance and about 200 in the transportation annex. The lamps will be on 100 volt secondary circuits, three in series. Each lamp will take 14 amperes at 35 volts. An "economy coil" is introduced to prevent waste of current in case only one or two lamps of a series is burning.

The Westinghouse company has secured the space on the ground floor of the electricity building originally allotted to the Detroit Electrical Works, as that concern will not make an exhibit. This space is contiguous to that previously allotted to the Pittsburg company in the southern part of the building. The Westinghouse people have also secured a portion of the space originally given to France in the northern part of the building, and have now over 15,000 square feet.

The Electrical Forging company of Boston has 1,955 feet space on the first floor of the electrical building at the World's Fair. It will put in a 200 horse power heating plant driven by two 100 horse power motors. It will exhibit an electrical cooking process, and machines for rolling metals and making forgings, etc.

Thermal Storage for Central Stations.

Prof. Forbes' paper on "Thermal Storage" at the St. Louis convention of the National Electric Light association is attracting considerable attention abroad. The London *Electrical Review*, after presenting an elaborate summary of this address, says:

Prof. Forbes accepts Mr. Halpin's figures relative to the saving to be effected as compared with secondary batteries, and generally appears to make out a good case for thermal storage, where space is not an object, and there are some very excellent reasons for its adoption, some of which we have noted above, but where Prof. Forbes thinks it especially useful is in the utilization of the heat of refuse incineration. Here there should be scope for the system, for the fuel comes in almost as a gift. General refuse cannot well be burned under a steam boiler. It ought to be completely consumed in non-absorbent furnaces to render the process innocuous and inoffensive, and the heat utilized entirely outside the range of the place of combustion. Refuse destruction should be a continuous process, and the thermal storage system affords a means of saving heat which would otherwise be uselessly and wastefully dispersed. The pumping of water to a position of potential energy very rightly commends itself to Prof. Forbes as the best means of storage where there is a convenient hill, as, for example, at Edinburg; but suitable reservoirs are not always to hand. A use for refuse, however, suggests itself in a place like London, where the water supply is chiefly pumped by day, and there is left for night time the production of light. The truth is that the excessive individualism of all our undertakings is responsible for much waste. A pumping engine may not be suitable to drive dynamos, but the fuel which burns to waste in an incinerator would supply steam which would as well drive an electric engine as a pump, and the same set of boilers would supply steam for both purposes. We might, did we wish it, find means for dispensing with the necessity of thermal storage, but at present we prefer to ignore such clearly obvious advantages as are open to us by a line of less individual effort.

Speaking generally, we should say that if anyone is disposed to be carried away by the thermal storage idea, he would do well to first make a few simple calculations as to the enormous bulkiness of the storage tanks, and not to forget the high temperatures which accompany high pressures when he comes to consider the boiler proper.

The Alternating Current System in America.[1]

By G. L. Addenbrooke.

At the late St. Louis convention a paper entitled "Some Experiences with the Alternating System" was read by R. H. Sterling, and was followed by a long discussion.

In speaking of the paper, the president said: "Gentlemen, you have before you one of the most interesting papers that you are likely to have an opportunity to discuss, and I trust the discussion will be free and full."

As the paper is descriptive and non-controversive, and the discussion serves principally to elucidate it further, the two together may be taken as fairly representative of the best present methods of operating alternating current stations in America, and the views of leading practical men upon the whole subject.

On the general question I do not think I can do better than extract almost *verbatim* a portion of the speech of Prof. E. R. Weston after the paper was read, as it is well worth the attention of English readers, and not only institutes a comparison between alternating and continuous currents, but between English and American practice. It is as follows:

"The question of the distribution of energy by the two systems under discussion is receiving great attention both on this side and the other side of the Atlantic. The systems as established here differ radically in one respect, at least, from the systems established on the other side. Here, for the purpose of economy in the first cost, a very high rate of alternation has been adopted. From present experience it seems as though this was a fundamental mistake, and that the mistake will be more apparent as the system has to be forced under ground, which it will sooner or later. We must all recognize the fact that any system of aerial conductors can never give us the safe and sure service which is necessary to enable us to compete with a satisfactory and reliable source of illumination such as gas. If our alternating current systems of this country were forced under ground, the loss would be undoubtedly greatly increased, but what the losses are exactly at present I have not been able to find out. No one seems to have made any special effort to determine them, and to ascertain exactly how they are distributed. With the direct system the losses are at the lowest point, and are very small, indeed, when the load is very light. The energy consumed then is practically what you use in the lamps, but in the alternating systems there is an increase of loss in the converters, as we readily understand. The difficulty of dealing with and ascertaining what these losses are through the wires is serious indeed, and it is impossible, almost, to arrive at them from the actual running plant, because it is very difficult to ascertain the total number of lights in circuit, and how these lights are distributed. To make a test, therefore, that would be really satisfactory, to ascertain the commercial efficiency of the alternating *versus* the direct current system, involves a great deal of labor and careful thought. The constant growth of the alternating current system indicates, however, one thing surely, namely, that it is filling a long felt want, and that it is a money-making investment, at least, for a large number of people. Whether the system as it exists in this country to-day will not be radically modified in the next few years, so as to approach more closely the systems of Europe, is a question; but I think it will. I think that will undoubtedly be done, and the tendency will be toward a lower rate of alternation and greater general efficiency. If any gentleman here has made a careful determination of the energy transformed, and has compared that with the energy actually used in the lamps, it ought to be brought out. It is a matter that everybody is seeking light on."

As no one seems to have taken any exception to these views, they may, being in accordance with the rest of the paper, be considered as agreeing well with the opinions of American engineers on the subject mentioned. This speech shows as, indeed, does the paper itself, that the greater part of American alternating work is still overhead, and that the methods of working adopted are designed to meet such a state of things. Next, it points to the fact that there is even more uncertainty about alternating current measurements among practical men in America than on this side. Lastly, it pays a very handsome tribute to English and European engineering in acknowledging that in theoretical and practical perfection the systems employed by us are the better, and are worthy of imitation, a tribute to the soundness of English engineering and science particularly, which is not ungrateful; although we on our side must acknowledge that Americans have made a more extended use of the alternating system than we have. Another point worthy of notice is that neither in the paper nor discussion is the parallel running of alternators mentioned as a usual practice, or a possible one; indeed one speaker refers to the running of alternators on separate circuits as a direct advantage over the parallel method as adopted in direct current stations. That a question of such practical importance here, and which has received so much attention, should come in for so little on an occasion like this, may seem curious, unless the American present system of distribution is properly understood.

In England, with an underground service, it is of importance to have a few main circuits, and numerous branches leading from them, as it is undesirable to have many parallel but separate circuits in the same conduit or pipe. This objection does not, however, apply in America, where overhead circuits on poles are used. As the poles will carry a large number of wires or cables, which are preferably light, it is easy to run a circuit direct from the station to any particular spot at any time without interfering with existing circuits. As further circuits are only erected for immediate prospective requirements, this method of distribution naturally brings it about that then a great many main circuits of comparatively small size are started from the station, consequently the load is easily distributed with fair economy over separate dynamos. The objections, however, to the galaxy of overhead cables or wires, which this system implies if worked on a large scale, is, evidently, from the tone of the speakers at the convention, proving too much for even American susceptibilities, and therefore it is probable that it will not exist in large towns for many more years.

To work a system of this sort requires naturally an elaborate or rather extended switchboard, and Mr. Sterling devotes a good deal of his paper to a description of a typical one. In principle, it simply consists of what was known as the Edison switch board in the early days of telephony. Mr. Sterling states that the board is preferably of marble. The circuits are all attached to vertical wires or cables arranged in pairs on the front of the board. On the back of the board are similar rows of wires, but running horizontally, a pair of wires for each dynamo. At the intersecting points double pole switches are placed so that any dynamo can be connected to any circuit. It is of course unnecessary to multiply this power of cross connection beyond a certain limit if the station is large, as the dynamos and circuits can be grouped in sections.

Directions are given for placing the volt and amperemeters and fuses, but these do not differ essentially from English practice, and the remarks which follow, at some length, on fuses, are not of great moment, since English engineers have pretty well mastered the difficulties under this heading, working at 2,000 volts, whereas the standard American working pressure for the primary current is only half this. It may be said that horizontally placed fuses are found to act better and are less liable to arc than those placed vertically, a fact which we can thoroughly corroborate.

A long paragraph of Mr. Sterling's paper is devoted to lightning arresters, a subject which does not interest us so much on this side where circuits are underground, but the following on converter cut-outs and switches is much to the point: "We are learning now that it is far preferable to have no fuses in the converter case, but a large primary fuse and switch box combined, removed from the converter." We have long since discarded secondary fuses in converters.

With the large number of circuits running parallel for long distances which the American system requires, it is not surprising to find that inductive effects occur occasionally between neighboring wires when attached to different dynamos not working synchronously, and which results in the lights 'jumping.' The remedy adopted, if one of the circuits cannot be shifted on to another dynamo, appears to be to transpose the mains midway in the manner which is adopted in telephony.

The remainder of the paper and a considerable portion of the discussion are devoted to the question of maintaining the proper pressure at the lamps and to devices for effecting it. This is a subject which has not received the same attention in Europe as in America, partly because the American circuits are as a rule larger than ours and scattered over a wider area, but chiefly owing to the fact that the primary potential employed is usually only 1,000 volts in America instead of at least 2,000 as with us. These two circumstances coupled with the use of numerous separate circuits, has caused the regulating of the pressure in feeders to assume a more important and complicated aspect than it has here at present. Regarding this Mr. Wagner says in the discussion: "I suppose you refer to the average loss in distributing the current. Of course that is left largely with the engineer designing the station and the circuits. In the case of the Missouri Electric Light company it varies from 5 to 10 per cent.; the average probably is about 8 per cent.—6 per cent. in the feeders and 2 per cent. in the mains. It depends on the proportion between the average load and the maximum load. That differs at different seasons of the year."

Regulation is effected by means of the Stillwell regulator or "booster," as it is euphemistically termed. This is simply a converter, each secondary turn of which is connected with a commutator. The secondary and the commutator are put in series with the main whose pressure it is desired to raise, and by altering the commutator more or less turns of the secondary can be included in the circuit. The primary circuit is simply connected across the mains in the ordinary way. The action of this apparatus is generally referred to as satisfactory, it being usually made to raise the potential by steps from 1 to 20 volts at will. As far as I am aware, similar apparatus is so far not in use in England because not yet needed, but as I believe its working is generally known to English engineers it is unnecessary to follow the description of it further, particularly as no theoretical details are given as to its working efficiency.

Such, as set forth in this paper and the discussion, appears to be the usual American method of distributing alternating currents to-day. It is characteristic that though questions are asked, nothing is said to the point as to the relative efficiency of direct *versus* alternating currents, or how the efficiency of such an alternative station as is described works out. Our practical cousins seem still fairly satisfied with the fact that they can cover a large area of ground more easily and cheaply with an overhead alternating system than with a low pressure direct one, and that it can be made to pay. As a general body they have evidently not yet reached the point we have, though as they get more circuits underground they will do so. If, therefore, any further solution of the question of alternating

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.

1. Abstract of paper in the London *Electrical Review*.

versus continuous current supply is to be looked for now it is to ourselves that we must turn for the solution.

Three Telegraph Bills Unfavorably Reported to the Illinois Legislature.

Three bills affecting telegraph companies have been under consideration in the Illinois Legislature during the last week. On April 12th the committee on corporations took up the subject. Bill No. 266 provides for the taxing of telegraph, telephone and express companies a certain per centage of their gross receipts; bill No. 198 compels telegraph companies to deliver all messages within one hour after their receipt; bill No. 205 requires telegraph companies to provide night operators at all offices controlled by them. Mr. Seawell, of the sub-committee to which these bills were referred, reported them back to the full committee with the recommendation that they do not pass. Mr. Nohe moved that the report of the sub-committee be received and that the bills be referred to the house with an unfavorable recommendation, but Mr. O'Connor thought that there was some merit in bill No. 198, and while it probably needed amendment he would like to see it become a law in some shape. It was then agreed that bills 205 and 266 should be reported unfavorably and that bill 198 should be considered by the full committee. Mr. Nohe moved that this bill also be reported back to the house unfavorably and explained the impossibility of framing a law to compel telegraph companies to deliver messages at all points within any specified time. The law as it now existed did not admit of any unreasonable delay in the delivery of messages and was entirely sufficient. J. B. Inman, manager, of the Western Union Telegraph company at Springfield, who was present, was called upon to give his views on the bill. He explained that if it became a law telegraph messages would have to be delivered at all hours of the night, and, therefore, night rates would be abolished. He said that the Western Union Telegraph company operated 1,501 offices in the state of Illinois, Many of these were along railroad lines and were kept open solely for the convenience of the general public. The passage of the bill would close every one of these minor offices. He claimed that the Western Union company made every effort to have all messages received by it promptly delivered, and he thought that the laws now on the statute books were ample for the protection of the public. The committee seemed to be considerably impressed with the force of Mr. Inman's views and promptly decided, by a vote of 13 to 1, to send the bill back to the house with the recommendation that it do not pass.

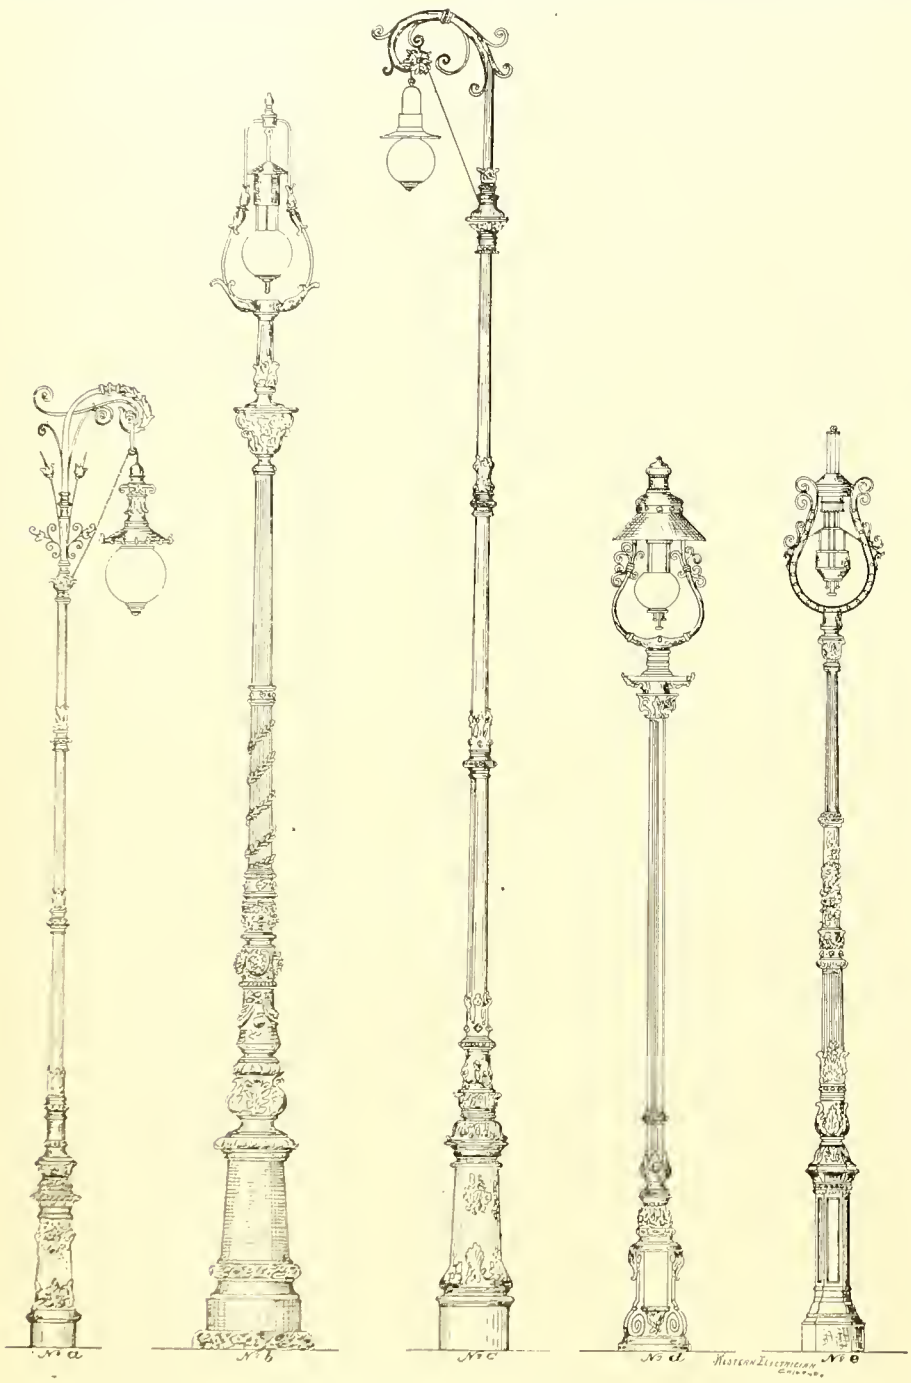

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.

American Street Railway Association.

The American Street Railway association will begin its twelfth annual meeting at Milwaukee, Wis., October 18 h. The headquarters of the association will be at the Milwaukee Industrial Exposition building, which has been secured for two weeks, although the meetings will occupy only three days. The sessions of the convention will be held in the spacious hall on the second floor, while the entire ground floor will be placed at the disposal of exhibitors The building is a very handsome structure and is admirably adapted to such exhibitions as those which have made the meetings of this association so attractive to street railway men. The building is 400 feet long and 293 feet wide, the ground floor having an area of 87,000 square feet, which can be utilized for exhibits. An advantage, which will be appreciated by those desiring power, will be found in the 150 horse power engine on the premises. The only additional charge will be the actual cost pro rata of furnishing power among the exhibitors. The nearness of Milwaukee to Chicago is considered to be a great advantage this year for making a satisfactory and extensive exhibit. The heaviest machinery and largest castings will all be under cover, and can, of course, be inspected much more advantageously than when in the street, especially should the weather be unpleasant any of the time. There is, of course, no extra charge for heating and lighting.

The secretary of the association, W. J. Richardson, announces that space will be alloted on May 10th. A charge of 10 cents per square foot will be made and no less than 100 square feet nor more than 2,000 square feet will be assigned any exhibitor without special arrangement with the secretary. Among the regulations governing exhibitors are the following:

Space allotted cannot be transferred without permision, and must be taken possession of on or before October 17th.

All goods shipped to the exposition should be plainly marked "Street Railway Exposition, Milwaukee, Wis."

The driving engine will be in operation on and after October 16th, and exhibitors of machinery in operation must have everything in running order, in readiness to start their machinery on the morning of the opening day.

All goods intended for exhibition must be on the premises and properly displayed on or before Tuesday evening, October 17th.

Exhibitors must provide all counter-shafts, pulleys, belting, hangers, etc., necessary for the transmission of power to operate their machinery.

Steam power and main shafting will be furnished to exhibitors at actual cost, to be charged for pro rata among those who use power. A main steam pipe, with numerous T's for connecting branches, will run through the hall to furnish steam to those who require it.

The main shafting will not be interferred with or taken apart, therefore exhibitors must provide themselves with split pulleys.

All machinery will, if possible, be exhibited in motion, and should be kept in operation at regular work during the hours 9 to 12 A. M., 2 to 6 P. M. and 7 to closing.

The main shafting is 3½ inches in diameter, and driven at a uniform speed of 162 revolutions per minute. The other lines of shafting are of different sizes, and all driven at a uniform speed of 200 revolutions per minute.

Exhibitors desiring to sell and deliver in the building any articles whatever must first obtain a written permit from the secretary for such consideration as may be determined upon. Any permit to sell may be revoked at any time, at the pleasure of the association.

Every possible precaution will be taken to guard against fire, and a full corps of watchmen will be on duty day and night; but the association will not be responsible for loss or damage to articles on exhibition by theft, fire or otherwise.

Thiele Lighting Bill in the Illinois Legislature.

Senator Thiele's bill providing for the extension of the powers of cities, towns and villages throughout Illinois has passed the upper house of the state Legislature, and by its terms these corporations are empowered to engage in electric lighting not only for municipal work but also for commercial service. It is generally believed that the lower house will pass the measure and in that case it is hardly to be expected that the governor will veto it. The bill is favored by many people who think that they will be able to get electric current for light and power at the bare cost of producing it. Others advocate it as a retaliatory measure believing that they are justified in ruining private enterprises on account of some imaginary grievance. The *Chicago Tribune*, which has been a persistent advocate of this measure, does not pretend that municipal plants are conducted upon an economical basis like private enterprises. Commenting upon this measure it says:

As a general rule the operating expenses of an industry run by a municipality are much higher than when a corporation or private individual has the management. Wages paid by a city are higher and more people employed than is necessary. The small economies are never thought of, but they constitute the profits in most businesses. Almost invariably, too, customers are better served by a private company than by a municipality and give it the preference.

That a city would charge consumers only cost price is an assumption. The bill does not require it. Water is not furnished at cost price, but much above it, so that there may be an income to be used for extensions. Presumptively, therefore, the city would sell electric light above cost, using the profits to extend its system and improve its plant, putting into its business the surplus which stockholders of private companies would put into their pockets.

This is in direct line with the claims that have been made by opponents of this policy. Those who favor

municipal plants claim that they are operated as economically as private enterprises, that the service is superior, and that it could be given at much lower figures than are charged by private concerns. When the bill was under discussion in the Legislature last week an amendment was offered providing for the "purchase and pay for any electric light plant or plants, including all conduits and other property used wholly or mainly as a part thereof, and all rights and interests of every kind and nature in such private plant or plants."

This amendment was offered on the ground that it would

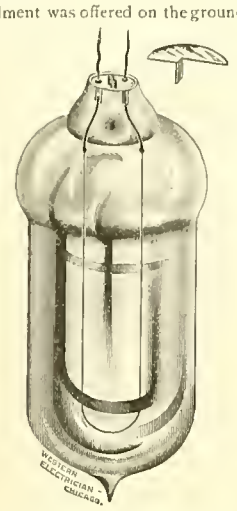

FIG. 2. VAN DER KAMMER'S INCANDESCENT LAMP.

be inequitable for the city to go in to a business in which it had allowed private capital to be invested with no intimation of future interference, and for the city to sell at cost commodities from the sale of which others expect to make a profit and thus practically to drive out of the business the private individuals engaged in it by destroying the value of their property. The argument holds good if the city is to furnish light at cost. If it is not the intention of the city to do so, the people should not be burdened by a tax for the establishment of plants from which they are to receive no material benefit, and the only object of which is to afford additional patronage for political heelers at the expense of taxpayers. This argument was presented in the Senate on Tuesday, but had no effect upon the members.

Electric Pencil in Photography.

The accompanying cut illustrates an improved form of an electric pencil used in photography. In retouching the defective lines or spots on a negative, the stroke of the pencil requires in almost every case to be minutely small, and as these small strokes have to be made with great care the process is necessarily very slow. Recently an American firm introduced a pencil which is rapidly revolved by a small electric motor so that the point of the pencil spins, and is rubbed on any spot by simply moving the point gently over it in any desired direction, thus doing away with the necessity for the tiresome confined motion of the operator's hand.

Another method and apparatus introduced in Germany consists in fixing the negative in a frame, which is vibrated rapidly by an electro magnet apparatus.

The device herewith illustrated is the invention of an Englishman and in it the pencil point is very rapidly vibrated through an exceedingly small stroke by a simple electro-magnetic contact breaker, so that the pencil has only to be guided by the operator while the electro-magnet performs the necessary rubbing at an exceedingly rapid rate, about 2,000 strokes per minute. It is claimed that this form is simpler and less liable to derangement than the rotating form.

A battery of two large Leclanche cells works this vibratory pencil, and where a number are in use one contact breaker can be arranged to work them all. Referring to the figure, *P* is the pencil pivoted at *R* in trunnions, *C* is an ebonite case carrying a bobbin of fine wire *H*, *B* is the contact breaker platinum screw point, *A* is the armature, a light piece of soft iron passing through the coil, *M* is a piece of soft iron fixed outside of the coil, to which the armature is attracted. A spring *S* opposes the attraction and sends back the armature, which is fixed on the end of the pencil. It will be readily seen that the pencil point makes a small motion compared with the play of the armature. The cut is reproduced from the London *Electrical Review*.

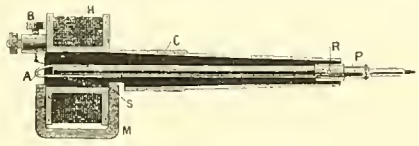
A franchise has been granted to the Wauwatosa, Wis., Street Railway company, and a line will be built through the town.

Van der Kammer's Incandescent Lamp.

Interest in the incandescent lamp litigation will be revived by the appearance on the market of the new lamp invented by John Van der Kammer of Chicago, to which attention was directed in the WESTERN ELECTRICIAN of March 25th. The characteristic features of this lamp are presented in the accompanying cuts, Fig. 1 showing the lamp complete and Fig. 2 illustrating the details of construction. The principal claims for this lamp are that by the use of the peculiar metallic base, the all-glass receiver and leading-in wire features of the Edison patent are eliminated, the process of manufacture is simplified and a more durable lamp produced. It will be noticed that the acorn shape has been adopted for this lamp, as it is particularly suitable for the form of construction employing a metallic base. In this form the metallic base is composed of two small plates of platinum, one of which is shown in the upper right hand corner of Fig. 2. These are secured in the lamp by sealing the glass around the edges. This arrangement makes the base consist of two distinct pieces of platinum, thoroughly insulated from each other. The filament of the lamp is connected to the small strips forming a part of the base and projecting into the lamp, while the wires passing through the socket are soldered to the outer side of the pieces of platinum forming the base.

The difference in expansion between the metal base and the glass globe is of no consequence in a lamp constructed in this manner, it is claimed, as there is sufficient flexibility in the metal to permit it to accommodate itself to the expansion of the glass. The metal base can therefore be made of some of the baser and cheaper metals. As this lamp, however, is not a vacuum lamp, it is deemed advisable to use a metal like platinum, which will resist the action of the gas employed.

The fact that the new lamp has a comparatively high pressure of gas within it renders the maintenance of a perfect vacuum chamber of less consequence than in the vacuum



ELECTRIC PENCIL IN PHOTOGRAPHY.

lamp. A seal which might not be satisfactory for a vacuum lamp, and perhaps could not be used for that purpose, might be entirely satisfactory for a gas lamp. The metal seal at the base obviates the necessity of joining glass to glass in the usual manner, and also the use of the internal seal piece, so that if the lamp is slightly damaged in the process of its manufacture, it may be repaired and resealed with very little additional trouble. Moreover, this form of base and construction permits the manufacturer to use the bulb itself an indefinite number of times and also the metal plates, as they are of comparatively large size and can easily be reclaimed from old lamps.

In this lamp the idea of perfecting the vacuum lamp has been abandoned for the reason, it is claimed, that a perfect vacuum being absolutely impossible, the vacuum lamp necessarily has a limit to its degree of perfection; in other words, the vacuum lamp based upon the idea of a perfect vacuum, which is unattainable, must of necessity contain within itself the cause of its own early destruction. In practice, it is claimed, the vacuum lamp, as ordinarily made, is quickly destroyed by a comparatively slight excess of current. For this reason Mr. Van der Kammer undertook the development of a commercial incandescent lamp on the principles set forth in the earlier gas lamp patents and publications concerning the incandescent lamp. Gas lamps were well known prior to the production of the vacuum lamp, and many kinds of gas were employed in them and at various degrees of density. Several difficulties were found with the earlier gas lamps, as, for example, it was found that the gas in the lamp, even though greatly attenuated, would tend to disintegrate or destroy the burner, possibly by the impact of its highly heated particles upon the surface of the burner. It was also found that with such gases as were then known, there was great loss of energy from the heating of the gas in the lamp. There were many other difficulties with the gas lamps, which finally resulted in the abandonment of the idea of producing a gas lamp and the substitution therefor of a vacuum lamp. Van der Kammer has turned again to the gas lamp as a means of avoiding the weaknesses of the vacuum lamp and has endeavored to produce a gas lamp which should not have the objectionable features of the early gas lamps. The new lamp, although containing a considerable quantity of gas, is said to be even cooler while burning than the ordinary vacuum lamp. There is no disintegration of the carbon, it is claimed, and no electrical carrying incident to overwork, even when greatly over run. For example, when a 100 volt lamp is run at 150 volts for a considerable time, the burner has been found to be normal in color throughout and practically unchanged. It is further claimed that the character of the gas employed is such that whatever injury the burner receives or tends to receive from such over-running, is promptly and completely repaired by the gas itself, so that in most instances when the lamp has thus been overrun, it will be found that the burner not only remains unchanged in its form and appearance, but that its resistance is actually slightly diminished, so that, for example, a 110 volt lamp burned at 160 volts for a short time will give the full candle power at 109 volts instead of 110.

Some of the delays in producing the lamp are attributable to the difficulty of obtaining the gas-producing substance in sufficient quantities. The gas employed is one which the inventor and the chemical experts of the company assert has never before been used in connection with incandescent lamps, and which it is very difficult to obtain. It appears, now, that all such difficulties have been removed. The manufacturers of this lamp claim for it great utility for certain uses, as, for example, on circuits supplied with current of varying pressure.

The fluctuation of several per cent. in the current will not vitiate the lamp or increase the resistance of its burner, at least not until such fluctuations have extended over a long period, or in other words, the practical life of the lamp.

There is a change in the method of construction which greatly simplifies the manufacture of lamps. Gas being constantly present, and the means of preserving or repairing the carbon being always at hand, the new lamp does not require such an elaborate process of manufacture as the vacuum lamp, in which the chief aim is to secure an initial vacuum of the highest possible degree, and to drive out of the lamp and all the parts the last trace of occluded gases. This requires an expensive process of pumping and electrically energizing the lamp during the process. Moreover, after this high degree of vacuum has been obtained it is necessary that the lamp shall be so constructed as to return the vacuum and permanently exclude all atmosphere from the lamp and close it against practically the whole of the atmospheric pressure. In the new lamp such perfect exhaustion is unnecessary.

This lamp will be called the new Sunbeam lamp, and

FIG. 1. VAN DER KAMMER'S INCANDESCENT LAMP.

will be manufactured by the Star Electric Lamp company, Chicago.

Ulsiah, Cal., is to have an electric railroad on its principal streets.

The Reading & Temple Electric Railway company of Reading Pa., has filed a notice of its intention to construct a system of of electric railways between Reading and Myerstown.

It is reported that an important deal was closed at Toledo, O., last week between J. K. Tillotson and George B. Kerper, of Cincinnati, who owns the Findlay electric street railway, by which a consolidation of interests has been effected for the construction of the electric railway that will connect Findlay, Fostoria, Tiffin and other North western Ohio cities and towns with lake resorts. A meeting will be held in Cincinnati soon to form a company, in which Tillotson and Kerper will be officers. The total mileage of the proposed electric road exceeds seventy miles.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

In the incandescent lamp litigation at St. Louis last week the Goebel claims were revived and an effort was made to strengthen the case as presented by the Beacon company at Boston. Additional affidavits were presented and it is claimed that evidence was introduced with a view of showing that the lamps originally made by Goebel and upon the practicability of which much doubt was expressed were really practical, though, of course, not perfected to the present state of the art. Decision has not yet been made on these claims, but it is not believed that there will be any radical departure from former rulings.

All interested in the subject of electric traction will rejoice in the announcement that a successful trip has been made over the intramural railway at the World's Fair, which is operated by electricity on an elevated structure. Many difficult engineering problems had to be met in the planning of this temporary installation. It had to be engineered as cheaply as possible, so that it would prove profitable for six months' service, and yet it must bear inspection as an exhibit of the latest step in electric railroading and be substantial enough to safely take care of the immense traffic expected. The engineering staff is to be congratulated on the result it has obtained without violating any of the conditions imposed.

Incandescent lamp makers will be interested in the new lamp of John Van der Kammer of Chicago, which is illustrated and described elsewhere in this issue. It will be remembered that this lamp was briefly described in the WESTERN ELECTRICIAN of March 25th. Since that time the details of construction have been perfected and the lamp is now ready for the market; in fact the lamps from which the cuts were made were manufactured for commercial use. In these new lamps there are two features upon which the manufacturers base their hopes of evading the Edison patent. In the first place, by the use of the platinum strips in the base of the lamp, it is claimed that the all-glass receiver feature is eliminated and at the same time the necessity of using leading-in wires is avoided. Then, too, it is claimed the new lamp is not a vacuum lamp but a gas lamp, and the inventor asserts that in going back to this form he has made a decided gain. He says that the inability of lamp makers to secure a perfect vacuum is the chief objection to the present form of incandescent lamp and that in discarding the vacuum for the gas lamp he has made an important advancement. His claims will undoubtedly be received with some reservation, but there is no doubt that the positive statements which he makes will be thoroughly investigated. It would certainly be a most remarkable circumstance if the present lamp controversy should result in the adoption of gas lamps in place of vacuum lamps, after the years of experiment and investigation which have been devoted to the development of the latter. The question of increased cost which the use of platinum will entail is met by the statement of the manufacturers that the platinum may be recovered, and that it is expected that a cheaper metal will soon be used.

In granting the Manhattan company additional privileges the Rapid Transit commission has practically turned over to that corporation the exclusive right to use the streets of the city of New York for elevated railways. This action on the part of the commissioners is greatly to be deplored. In the first place the "L" system can give only temporary relief at best, and in a few years the city will again be confronted with the question that has occupied so much attention during the last twenty years. It is merely putting off the final solution of the problem, and each additional grant will only serve to further entrench the Manhattan company and make the city's labor all the greater. A comprehensive system of underground roads could now be planned and future extensions provided for, but with the "L" system the best that can be hoped for is an occasional addition or extension, which will afford very little relief, and that only to a comparatively small portion of the population. But New York has pronounced against an underground system; the mayor says that the people don't want it and capitalists have shown no inclination to back up the project. The constitutional provision prohibiting the city lending its credit to private enterprises thwarted the plans of the capitalists who were willing to put up $15,000,000 as evidence of their faith in the project and their interest in the city's welfare. In the face of Mayor Gilroy's opposition it was not to be expected that the Legislature would come to the rescue of the people, and besides it is intimated that the city and state officials thought that if $35,000,000 or $50,000,000 of the city's funds were to be expended it should be so arranged that political organizations should have the benefit of handling the money and distributing patronage. Whatever may have been the cause, it is certain that the underground plan is killed for the present, that the elevated system has taken on a new lease of life and that the city will find it harder than ever to rid itself of the monopoly established by the Rapid Transit commission's grant of last week. It is a hard blow for New York and one that it will take many years to recover from.

Interest in the subject of the application of electricity in naval warfare is given a fresh impetus by the great assemblage of American and foreign warships in Hampton Roads in honor of the opening of the World's Columbian Exposition, which is close at hand. In all the modern vessels electricity is now employed in a threefold capacity—for lighting, including the indispensable search-lights; for power transmission, in moving the heavy guns, operating ventilating fans and the like, and for signaling. On the occasion of the drill of the "white squadron" in New York harbor a complete account of the electrical appliances on the flagship Chicago was presented in the WESTERN ELECTRICIAN, the date being August 5, 1891. Even since then considerable advance has been made, however, and naval officers look for a still greater extension of the use of electricity on vessels of war. In speaking of future naval operations one of the American officers now at Hampton Roads said:

Electricity is to be utilized, if not for propelling the ship, at least for every other purpose where steam has been thought indispensable. We already have electrical appliances by which vessels signal each other, and by which the captain in the conning tower may direct the firing or communicate with any part of the vessel. Within a short time the system will be so perfected that the commander in the tower will, by the means of electrical contrivances, have absolute control of every motion of the ship and the action of every gun, so that he will not be dependent upon the promptness or coolness of his subordinates. When that day is reached a naval battle will be more than ever a contest between two men.

Some of the leading electrical engineers of the country were formerly officers in the navy, and are well acquainted with the needs of the service, and a large proportion of the present officers, especially in the engineering branch, are well versed in the laws and practical applications of electricity, and are enthusiasts on the subject. With all these keen minds at work it will be strange if our cruisers and battle-ships do not come more and more under electrical control, with all the circuits leading to the master mind in the conning tower. There is something terrible in the thought of two great ships of war engaged in a battle of extermination, which is in reality a scientific encounter between the two commanders, each grimly yielding the weapons of destruction under his control by means of a network of electric wires. But that seems to be what is coming, and, on large ships at least, the individuality of junior officers and seamen must give away before the ubiquitous current of the battery and dynamo.

When there is a job of plain, unvarnished lying about the World's Fair to be done, there is probably no newspaper in the United States that can accomplish the task with as much brazen effrontery as the New York *Sun*. The *Sun's* jealousy of Chicago has led it to make a ceaseless warfare of vituperation on the exposition ever since Congress located the fair in the western metropolis. An occasion for an unusual display of mendacity appears to have arisen a few days ago, however, for an item headed "Chaos at Chicago" appeared in the *Sun* of April 14th, in which that journal gave circulation to a tissue of falsehoods easily outclassing all previous efforts in that line. The lying, although noteworthy for the extent to which the facts are perverted, is much below the standard of the *Sun's* art, for the prevarications are so palpable as to be absurd. For instance what could be more bare-faced in the shape of a falsehood than the statement that "None of the buildings is completed; none is likely to be completed by May 1st, the date set for the opening." The truth is, of course, that nearly all the large buildings are entirely completed. About the only ones on which work of any consequence is being done are the administration and machinery buildings. Some, like the woman's and horticultural buildings, were turned over by the contractors nearly a year ago. The work now under way is mainly on smaller buildings, begun this year, and on the installation of exhibits and clearing of the grounds.

In the *Sun's* manufactured arraignment, which is put in the shape of a dispatch from Chicago, it is stated that "In the electricity building, for example, which has fifteen or twenty acres of ground space, just one exhibit has been installed." Of course, this is simply another lie. In the first place, the electricity building has five and one-half acres of ground space, and not fifteen or twenty. In the next place, there are probably one hundred exhibits installed instead of one. Not more than half a dozen displays, perhaps, are entirely completed, as the opening is set for the 1st of May and not the middle of April; but a very large proportion of the exhibits is now installed in the building, and the work of embellishment and booth-building is proceeding in every part of the structure with such encouraging activity that it is morally certain that the interior will be ready for inspection in the early days of May. It is not to be presumed that the last finishing touch will have been put on every exhibit by the first of the month, but it may be confidently asserted that the display will be more nearly completed than that of any one department of any previous international exhibition.

Of course the announcements that "the World's Fair is in a state of chaos" and the like are merely malicious nonsense, and it would be a waste of time to dwell on each one of the falsehoods which are contained in the alleged dispatch referred to. We simply desire to assure the eastern members of the electrical fraternity who may be disposed to discredit the electrical display, owing to the violence of this and similar attacks, that the references to the electrical exhibits are as ridiculously false as their own good sense must show them the general diatribes to be.

Incandescent Lamp Litigation.

The city of St. Louis was last week the center of interest for those engaged in manufacturing and using incandescent lamps. On January 17th last the Edison General Electric company was granted an order restraining the Columbia Incandescent Lamp company of St. Louis from making and shipping lamps. On Thursday last the case came to trial on the motion of the Edison company for a preliminary injunction to prevent the Columbia company from manufacturing lamps.

The cause was heard by Judge Moses Hallett of Denver, in the United States Circuit Court in St. Louis. R. N. Dyer of New York made the opening argument on behalf of the Edison company. He was followed by W. C. Witter and William H. Kenyon, New York, for the defense. They were followed by Clarence F. Seward of New York and F. P. Fish of Boston, both for the Edison company, Mr. Fish closing the case. Additional counsel in the case were Judge Henry Hitchcock for the Edison company, and Judge E. B. Adams and Messrs. Fowler and Fowler of St. Louis, for the Columbia company.

The defense was based upon the claimed manufacture and use of the incandescent lamp by Henry Goebel, prior to Edison. Some 250 affidavits were filed in support of this claim. An interesting feature of the case was the fact that the Goebel lamp "No. 4," which was looked upon with some suspicion by Judge Colt in the decision of the Beacon case in Boston, was here supported by a formidable array of affidavits. The authenticity of this lamp was further claimed and an effort made to sustain it by the introduction of a new lamp, designated as 'No. 9," this lamp, according to the defense, having been made at the same time and in the same manner as "No. 4." This lamp was in the possession of John C. Goebel of New Haven, Conn., a son of Henry Goebel, who makes affidavit that it was given him, with two others, by his mother in June, 1878, just previous to his intended departure for Europe, it being his intention to show the lamps to an uncle in Europe. The date of this event is fixed by a passport, which was filed in evidence, and which was dated June, 1878. Mr. Goebel, however, did not go to Europe as intended. The other two lamps given Mr. Goebel by his mother were given away, one of them to the engineer of the Bigelow Manufacturing company of New Haven, Conn., who burned it in connection with a dynamo. Mr. Goebel kept lamp "No. 9," showing it frequently to members of his family and others. In October, 1878, he was engineer at the German Hospital in New York, where he showed the lamp to various people. The records show that he left the hospital in 1879. He afterward went to New Haven as an engineer, keeping the lamp in his trunk, and showing it frequently. All three lamps were identified by several people as having been seen in the German Hospital in New York in October, 1878. Further evidence of practically the same character as that introduced in the Beacon case was presented.

The Edison company offered in evidence 450 pages of affidavits. This was also practically a repetition of the evidence on the Beacon case. Seventeen witnesses saw the telescope exhibited on the streets of New York, and identified the person making the exhibit as Goebel. They did not know Goebel, and saw no lamp used in connection with the exhibit. Some 250 pages of the evidence are from witnesses who saw the telescope, but no lamp. The remainder of the affidavits are from experts who testified as to the condition of the art in 1878, from which they felt convinced that it was then impossible to manufacture or operate such lamps as those claimed to have been made at that time by Goebel.

It is claimed that since the decision of the Beacon case Goebel has taken the same apparatus which he originally used, and has reproduced lamps similiar to those submitted in evidence, and has shown them to be operative.

The case was closed at 4 P. M. Friday, April 14th, and is in the hands of Judge Hallett, who has promised to deliver an opinion within a week, if he can find the time to go through the records.

Considerable interest has been manifested in the progress of this case, the court room frequently being crowded. The electrical people of St. Louis particularly spent as much of their time as they could possibly spare in the court room. J. H. Rhotehamel, president of the Columbia company, has given the matter of the defense of this case a great deal of time, study, and hard work of late.

The Fox River Electric Railway company of Elgin, Ill. has decided to build an electric line from Elgin to Aurora, passing through St. Charles, Geneva and Batavia. It is said that a line will also be built from Carpentersville to Elgin. If this is done, it means the construction of a continuous line of 28 miles.

Rapid Transit for New York.

The plan for securing rapid transit for New York city by means of an underground system of railways has been defeated. As soon as the plan was announced Mayor Gilroy announced his opposition to the measure, and, as the act under which the commission was working confers upon the mayor the power of vetoing any plan the commission may adopt, the plan was practically killed before the commissioners went through the formality of receiving a report from their counsel. The mayor said that he was opposed to any scheme by which the city should lend its credit to, or become in any way connected with, a private enterprise. The only objection that had been made to the underground plan was the failure of its advocates to secure the necessary capital. It had been contended that this capital could only be secured at ruinous rates of interest if the project were conducted as a private enterprise, and the mayor expressed the opinion that this was sufficient reason for the city keeping out of the deal. If it was a good investment he believed plenty of capital could be secured without appealing to the city. The credit of the city at the present time is excellent, but the mayor said it would not long remain so if it adopted the policy of lending its credit to such enterprises. It would soon reach the limit allowed by the statute, and public improvements would be brought to a stand still. The condition of Brooklyn was cited as an instance illustrating this point. Concluding his statement, Mayor Gilroy said: "I don't know much about the plans of the Rapid Transit commission. I might as well say right now and in this way save the Rapid Transit commissioners a good deal of trouble, that I shall never approve any plan which they may formulate or any plans which some one else may formulate, and which they may present, which contemplate the expenditure of the city's funds or the lending of the city's credit."

The mayor is opposed to underground roads generally, it should be remembered. He said: "I do not believe the citizens of New York want an underground road. They have an underground road in London. We have our line from Forty-second street to 125th street, and it is intolerable in the summer. So far as the London road is concerned, it is an abomination. I have ridden on it, and I, know what it is."

Referring to this interview, Chairman Steinway of the Rapid Transit commission said: "I believe that this underground road should be built by the city under the plan offered by Mr. Wilson. The city's share cannot exceed $35,000,000. It would be so limited by law. The road should be built under the supervision of a commission of citizens rich and honorable and retired from business, men who are not identified with any railroad enterprise. I readily understand the chief ground on which Mayor Gilroy now stands. He has with wonderful energy pushed to consummation a great many public improvements that have been delayed for years, such, for instance, as the widening of Elm street and the creation of the speedway, both splendid and absolutely necessary measures, and perhaps he does not believe that it would be judicious to approach too near the constitutional limit of indebtedness; but, nevertheless, this is a needed and a vast enterprise, strictly for the city's interest, it seems to me."

Mr. Steinway added that he was sure that the cost of the road could not exceed $50,000,000. He had obtained estimates from contractors, and he knew. He was certain that it could not be built by private enterprise, and that it would not hurt the city's wonderful credit to issue the necessary bonds. He said also: "Extension to the elevated railroad must be granted. I shall do all that I can to secure that, in order that immediate needs may be supplied."

When the matter was taken up by the commission at its meeting on Tuesday, John M. Bowers presented his opinion on the legal status of the case. He declared that such a proposition could not be accepted, as it was unconstitutional. Mr. Wilson's propositions were then withdrawn, and the commission then proceeded to consider other plans. Mr. Starin submitted a plan for a road partly underground and partly elevated, but this proposition was rejected. Mr. Spencer's plan was finally reached and at this point Mr. Starin, who had all along opposed the invasion of the boulevard by the Manhattan company, said in the course of a speech:

As the members of the Rapid Transit commission are aware, I have always held the view that any extension of the existing elevated railroad system can at the best furnish only temporary and inadequate means of local travel to the people of this city. At the same time I have from the first stated that I would not place my individual opinion in opposition to the expressed views and will of all the other commissioners.

In this view I am ready to relinquish my personal preferences and to act upon this question without further delay. At the same time I am fully convinced that in conjunction with it we must act upon the question of compensation as well.

Being desirous of fixing such compensation at a sum against which no possible complaint can be made by the Manhattan company, I have concluded to adopt the theory of the law under which the West Side & Yonkers Patent Railway company was organized, to which charter the Manhattan Railway company succeeded, and to assent that the additional concessions be granted upon the Manhattan company contracting to pay to the city 5 per cent. upon its net earnings, not alone of that part of its road which it acquired under the above legislation, but also of that part of its line on which it now pays nothing, and upon the proposed extensions and additions.

Unless the company desires to pay nothing for the franchise it can scarcely ask lower terms. The plan proposed removes the objection that has been made that the operation of the additional facilities will increase the proportion of the road's operating expenses as against its gross earnings. It imposes no obligation upon the company which will have to be paid without reference to its net earning capacity, and leaves a corporation with a monopoly of the elevated railway system in the county of New York paying only 5 per cent. upon its actual net earnings from year to year.

This proportion was finally accepted, and the commissioners voted to give the Manhattan company exclusive control of the elevated lines of New York city. The plan was submitted to the Manhattan company, and, it is believed, will be accepted as a final adjustment of the case.

The attitude of the city officials toward the underground plans proposed has caused considerable comment. The *Times* says:

A gentleman who has been actively interested in the work of the commission, and who is very hopeful that something may yet be done to provide genuine rapid transit, said yesterday that he had become convinced that the opposition of the city authorities to the project for municipal construction was based mainly upon the fact that by the terms of the Ellison bill there would be no patronage in the work, while it would consume a great deal of money that might otherwise be devoted to projects that permitted a good deal of patronage.

He thought the only way that the city authorities could be made to acquiesce in plans that had been seriously advanced for underground construction would be by a popular demand that the work be pushed forward regardless of all political considerations.

English Comments on the St. Louis Convention.

Commenting upon the proceedings of the National Electric Light association generally, and the recent St. Louis convention particularly, the London *Electrical Review* says:

Some of the topics discussed at these conventions run in grooves, that is to say, some theme or another receives an unusually large share of attention. During the earlier period of the association's existence, electric lighting was the principal subject; indeed, the society adopted the title "National Electric Light association." More recently, papers on electric railways almost monopolized the atmosphere of the meetings. This year no fewer than three papers were read relating to the electric transmission of power, and a few remarkable statements dropped from the mouths of speakers.

In reviewing Dr. Bell's paper the following statements are made:

He [Dr. Bell] points out all the advantages of the multiphase system, even to the distribution of light incandescent lighting, although we do not know of a single instance in the United States where the system has been employed on a commercial scale. We can only conclude that he can only draw his inferences from what has been accomplished in Europe, notwithstanding his sarcastic remarks. He adds that there is a possibility that we may have before long practicable motors to run on an ordinary alternating circuit, constructed as suggested by Prof. Elihu Thomson a few years ago. C. E. L. Brown, abroad, has been making a desperate effort, says Dr. Bell, to exploit these new methods on his own responsibility, and has obtained motors which run successfully, but, as yet, do not start well under load. In connection, we would point out that we have recently seen a number of alternating motors constructed by C. E. L. Brown, of ½ to 20 horse power capacity, driving machinery, workshops, sawmills, lifts, etc., with a perfect success, and we have had the opportunity of testing the self-starting qualities of some of these motors. Here, again, Europe is ahead of America in the practical application of a useful invention.

Concerning Mr. Stillwell's paper the following comment is made:

We need not refer at length to this communication except that the author ventures a remark to the effect that very few men even among those who are actually operating central stations are able to say exactly what the power costs them, and that it is not surprising that the engineer who is called upon to lay out, let us say, an elaborate plan for the utilization of water power, finds it difficult to give explicit answers to questions relating to the cost of operating such a plant, probable revenue to be derived from the sale of power and in general economic feasibility. We trust that this remark applies only to his side of the Atlantic.

A controlling interest in the Enterprise Street Railroad company, Charleston, S. C., will probably be secured by the Great Western Manufacturing company. In such an event electricity would be adopted as the motive power on the lines.

Country Roads and Electricity.[1]

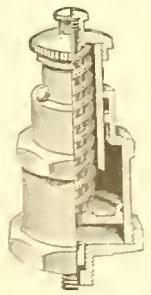
The Wheelmen's League is agitating a scheme for improved country roads which is modestly estimated to cost not more than $10,000,000 in the state of New York. They have introduced a bill in the Legislature for the promotion of this object, and to mollify the farmers, who are expected to object to the trifling expenditure, it is announced that only a small part of the cost will be levied on the agricultural districts. It is not announced, however, where the weight of the levy is to fall, and in the absence of more definite information it is presumed that the main part of the cost will be assumed by the bicyclers themselves, the young fellows who compose the league. The cities are careless about bicycling, and it is not thought that they could be drawn into the scheme without even a greater effort than it takes to paddle a bicycle over a muddy road.

There is an alternative plan, however, which has been considerably agitated among electrical engineers and manufacturers, and it is one that cannot fail to be of great interest to farmers when it has generally been brought to their attention. It is a plan to lay electric railways on all the country roads, and, through the general distribution of electrical power, to enable the farmers to not only travel wherever they please to go, at about any rate of speed that they are willing to risk, in vehicles under their own private control, but to do a large part of their farm labor by electrically propelled agricultural implements. The arguments in favor of this plan may be summarized as follows:

First, it will make the cheapest and the only comprehensive system of road improvement that can be considered practicable for a country so large as the United States. In most sections of this country a district 10 miles square contains about 100 miles of roadway. In the western states the mileage is greater; but in the East and South it is sometimes even less. But in a district 10 miles square there are 600 one hundred acre farms, or their equivalent total of 64,000 acres. Then, as the electric motor has a wonderful facility for running up hill and there will be little or no grading required, it is not difficult to estimate the cost.

Taking a district 10 miles square, the surface that can be served from a single central power station, and estimating on the cost of the track, poles, wires, and central power stations of the electric railways already in operation as a basis, it is maintained that a total capitalization of $10 per acre would be sufficient to provide an electric railway system in the country, not considering any further agricultural use of the electric power. This would mean an annual interest charge of 60 cents per acre, or $60 for each 100 acres of land in the district. It seems like a very trifling expenditure when we consider the magnitude of the service proposed. But, of course, to this estimate must be added the operating expenses, and the interest on the cost of the electric wagons owned or rented by the farmers. In the calculations of the electrical experts, however, the total is not made to equal the expenditures entailed by our existing road system when we count the saving of time as an incident of value. As to the profits of the operating companies, they would accrue to the farmers themselves if they become, as it is maintained they should be, the chief stockholders.

Next after the claim for greater economy comes the claim for greater efficiency in service. The advocates of an electric system of country roads maintain that it costs a farmer who lives at any considerable distance from town more money to get his produce to market than it afterward costs to get it to New York, or even to Liverpool; and, whether this claim be well founded or not, it is certain that, if a farmer places any value upon his time, the marketing of his produce is a very expensive undertaking. But with an electric railway in operation he need go to no considerable expense for this work. The companies owning the electric plant could send cars or trains to the different farm-

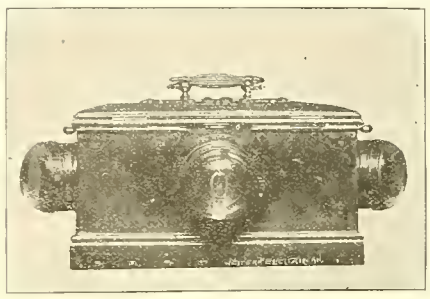


NEW AUTOMATIC SELF FEEDING CUP.

yards, collect the produce, and deliver it at the nearest market town for a small part of the cost entailed by slow horses and wagons, even estimating time as of no value. But this would be only the beginning of the farmer's advantages. The ability to travel at any hour of the day or night and through any kind of weather, in a perfectly protected vehicle at the rate of eighteen or twenty miles an hour, would be a source of inestimable convenience and comfort.

The third advantage claimed for the system is still broader than even the claim of greater economy, greater convenience, and more generally efficient service. It is commonly known that during recent years the increase of population in this country has been flowing in a disproportioned ratio toward the cities and large towns along the line of railway communication, while the little country villages remain merely cross roads hamlets, without growth or progress of any kind. This is due to the fact that the manufacturing interests of the Union are rapidly growing, and that along the line of railway communication offer the advantages of cheap production and the cheap distribution of merchandise. It costs too much to distribute coal through the country districts to permit its use for anything but domestic purposes. But with a system of electric railways in operation this disparity would disappear. On account of the greater cheapness of lands and rents, the smaller villages would become the most available points for cheap production, even while the steam engine and coal remained the only source of manufacturing power. But with the general distribution of the current would come also the general distribution of electric power; and this would add to the inducements of the country as a field for the manufacturing industry. Then the rural villages would begin to receive their fair proportion of the increase of population, and this would react upon the farmers greatly to their advantage. Truck farming would soon become universal, instead of the exclusive industry of suburban farmers, and farming operations could be universally conducted with greater profit.

But the projectors of an electric system for the country do not limit their claims to merely material considerations.



ELECTRIC YACHT LANTERN.

It is very well known that, owing to sparse population and the difficulty of intercommunication, the educational institutions of the rural districts are very defective. But it is suggested that with electric railways in operation only one school in a township would be needed, and that this school, while it could be made equal to the best city schools in every educational advantage, would be superior to the city schools, with their mixed attendance, in moral advantages. Children could be transported between their homes and a centrally located village school without serious loss of time, and the demoralizing associations incidental to attendance on city schools could be avoided. Then the country would become an ideal place for the training of children, and this would bring a further influence to bear in favor of a more rapid increase of rural population. It is certainly true that the superior educational advantages of the cities are among the chief causes for their rapid growth at the expense of the country.

Finally, the argument takes a range as wide as our political and social science. The effect of practically concentrating a territory 25 or 30 miles square into a space no larger than a 5 mile radius under the ordinary resources of transit is broadly considered, and it is concluded that the social results must be beyond calculation. First after the consolidation of schools and the coming of better teachers would follow the consolidation of churches and the advent of better preachers. The people of large districts would thus be brought into more intimate relations with each other, and a more cosmopolitan spirit would be engendered. Entertainments of an intellectual and innocent kind would be found also everywhere within reach, and country life, made larger socially and more varied, would lose the monotony and dullness which now drives so large a proportion of the sons of farmers to the cities. The country, indeed, would become an ideal place of residence. Even the postman and the newsboy could go their daily rounds and the morning newspaper would become as familiar a visitor at the farm-house as it has long been at the urban or suburban dwelling. In truth, the number of postoffices in the United States could be reduced three-fourths, it is believed, and a better service rendered from the remaining one-fourth than we can ever expect to see under prevailing disadvantages.

But even yet the arguments in favor of extending the electric system into the country are not repeated in full; and it may be thought by some persons that the reason still to come should have been placed first and made the inspiration of the entire plan. The farmers, it should be pretty well known by this time, are not altogether satisfied with their profits. They think that with their large capital invested, about the largest, according to statistical estimates, in the country, they should be able to get larger returns. But it is doubtful if they can ever get larger returns from exclusively agricultural operations, or not, at least, until all the arable land is taken up and the fatal facility with which new men may become farmers is checked by the cost of investment. What the farmers seem to need is an independent field for investment—a field that will enable them to put their savings into income-producing property beyond the reach of the fierce competition of the plow and the cultivator. This, it is claimed, is precisely the field that will be opened by the electric motor. The companies building and operating the electric power plant will find a wide source of profit. They will find it not merely among the farmers themselves, but in the rural villages, soon to become considerable manufacturing towns, demanding light and power. The day is not now distant, either, when the telephone patents will expire, and then the telephone may be brought into universal use and made to contribute largely to the profits of the companies. All this can be made to accrue to the profits of the farmer, if he will display sufficient enterprise to take advantage of his opportunities.

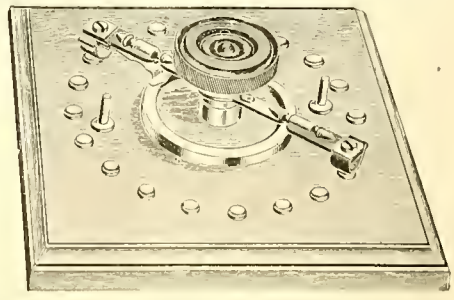
These are some of the arguments advanced in favor of pushing out the electric service into the country. But for the discomfiture of the Wheelmen's League there is still another argument which interposes with peculiar force against their expensive scheme for old-fashioned road improvement. It is urged that the general adoption of the railway system in this country of magnificent distances and difficult means of intercommunication is inevitable, and that any kind of improvement that contemplates the perpetuity of horse traction on the highways would be a mere waste of money. It is consistently claimed that there will be absolutely no occasion for any farmer or other citizen of the rural districts to go upon the roads except in electrically propelled vehicles after the electric system has been brought into general use, and that the time when it will be in general use is not distant in any event. The stimulus to activity will not be lacking, because it is believed to be the best field of investment in the United States, and too promising to be neglected, even should not the farmers themselves become the promoters. The capital invested in electrical manufacturing in this country now amounts to many hundreds of millions, and, in addition to this large total, the iron industry and other branches of industry engaged in manufacture of railway rolling stock will be equally concerned with the electrical manufacturers in the extension of the railway system. All these large interests will work together for a common end.

At present the electrical manufacturers are overburdened in filling orders for street railways, and they are compelled to continually enlarge their plant to meet the demand. But in the course of a few years, four or five years at the utmost, the urban and suburban demand will be pretty generally met, and the orders will begin to fail. Then we can look to see the next step taken. It would not be consistent with the character of the American manufacturer to abandon a portion of his plant when the whole continent remains to conquer. He will push out into new fields, and invade the country. The country stage coach has gone. The country road must follow, and it is not believed that it would be sensible to bond the state of New York for $10,000,000 for such roads, when in less than twenty-five years at the furthest they will have to become a tradition, and the bonds alone would remain as a memento. A $5,000 a mile macadamized road would be no better foundation for an electric railway than a dirt road. It would not be so good.

It is possible that against these claims the advocates of improved roads may suggest the storage battery system, and urge that we may have both improved roads and electricity. But it has been observed that wherever the obstruction of cost—the present obstruction for the storage battery—throws itself in the way of electricity it proves to be a very obstinate obstruction. It does not look now as if the storage battery could ever be more than a subsidiary source of power. Then, again, electric vehicles could never be driven at the high rate of speed that would be demanded in the country, except over iron rails.

New Automatic Self-feeding Cup.

In the accompanying illustration is shown a sectional view of a new automatic self-feeding cup known as the "Lackawanna." These cups are adapted to almost every possible variety of service, from the heaviest to the lightest, having regular pressure at every point, whether full or empty, and giving the spring equal tension. They are used on engines, line shafting, machine tools, elevators and electric motors. The Clarendon Oil & Refining company of 114 North Front street, Philadelphia, Pa., has adopted this cup, and to insure its use furnish it to all its regular customers. Many customers prefer grease, with no waste or



NEW VOLTMETER SWITCH.

oil drippings, when used in connection with this cup. This cup is in use by some of the largest manufacturers and railroad companies in the country, and is becoming quite largely known and adopted by users of electrical apparatus.

New Electric Railway Project for Chicago.

One of Mayor Washburne's last official acts as chief executive of the city of Chicago was the signing of an ordinance passed by the city council on April 5th granting the Chicago & Jefferson Street Railway company a franchise for a road beginning at Elston and Milwaukee avenues, and extending northwest to the city limits, with several branches. Electric motors will be employed, and the company is given the privilege of constructing an overhead trolley line under direction of the commissioner of public works.

Galva, Ill., will soon be electrically illuminated.

A New Trolley.

The Allen Trolley company is the name of a new firm located at 123 North Third street, Philadelphia, which is bringing out a line of trolley appliances that is attracting much attention and which is already having a large sale. Fig. 1 shows a new trolley spring which has many points of merit. In contact with the spring are two small pulleys which insure positive action of the spring in holding the trolley wheel to wire. In Fig. 2 is shown the parts of the trolley arm—the principal feature being that the shaft of the pulley and wheels revolves and not the wheel alone in fibre graphite bearings, which do not require oil. A recent test of 900 miles was made. The contact is positive and

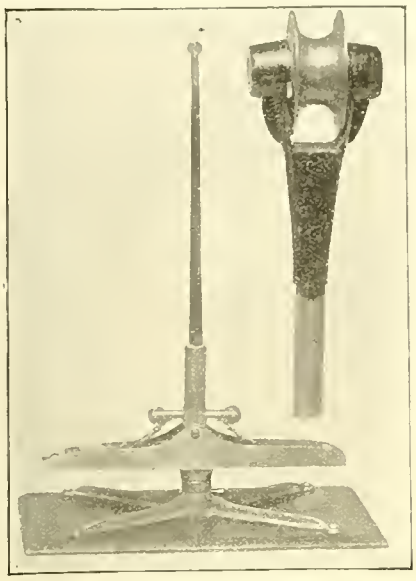


FIG. 1. A NEW TROLLEY.

insures full effect of current. The claim of this company in having an oilless, noiseless and clean trolley will be much appreciated by companies operating electric roads.

New Voltmeter Switch.

With the increasing number of isolated plants electrical practice and apparatus in this line becomes more important. Nearly all large buildings of modern erection maintain their own plants, often very extensive and complete, and usually including a switchboard of slate or marble holding the apparatus for the control of the plant. The grouping of a number of machines in this way, feeding into common bus bars, renders necessary means of controlling each one at any time and uniting its action, especially with reference to voltage.

For the latter purpose the Electric Engineering & Supply company of Syracuse, N. Y., has recently placed upon the market, in connection with its switch boards and voltmeter, the voltmeter switch herewith illustrated.

As the name indicates the instrument is to be used in connection with a number of generators in place of the primitive strap switch or the cumbersome plug method adopted when the number of circuits becomes too large for the former. They are made in two styles, single and double pole. The arm is brass, of two pieces, insulated and mounted on the central support. A light spring contact piece is carried on the lower side at each end, and as the arm is rotated by the corrugated hard rubber disk at the center, these touch diametrically opposite posts. One contact spring is lengthened to bear on the ring on the base, and between this ring and the other arm through the center post the voltmeter is connected. The test wires from the circuits are brought to opposite posts, and by turning the arm the voltmeter may be connected to any circuit or cut out. Stops are provided to prevent reversal of the current.

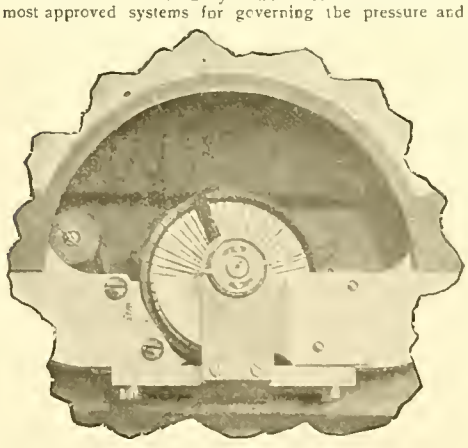
While there is nothing especially new in this instrument, its convenience, neat appearance and workmanship commend it to all station men and electrical users who look after the details of their plants.

Electric Lantern for Yachts.

A new and practical idea is presented in the accompanying illustration of an electric lantern for use on small pleasure yachts. This lantern is placed on bow of boat. It consists of three bull's eyes, showing white light ahead and the starboard and port lights respectively. Each bull's eye is illuminated by an 8 candle power 6 volt Edison lamp. Current sufficient to run the lamps six hours on one charge is supplied by three cells of the Franklin storage battery. These cells are made of slate to prevent spilling of the solution. Connections for charging are made through binding posts at the back of the lantern. The lantern is made of highly polished brass and measures 12¾ by 5 by 6¾ inches and weighs, complete, 38 pounds. This lantern was made by the Franklin Electric company, 106 Liberty street, New York. This company recently made a carriage battery consisting of five cells enclosed in a box which is placed under the coachman's seat to supply current for a 12 candle power 10 volt lamp placed in a cone-shaped reflector. The lantern and carriage lamp were made from the designs of F. K. Irving.

Introduction of the Electric Railway in Bangkok, Siam.

The operation of electric railways is not understood in Siam, and the people of Bangkok looked with awe upon the first electric car which was recently started upon the road of the Bangkok Tramway company. Regarding the substitution of electricity for animals on the street railways, the Bangkok *Times* gives the following interesting account: "Arrangements were made through the representatives of the Brush Electric company in China and Japan, to supply the plant necessary for working the tram cars. Under the very able and energetic superintendence of W. J. Davison, electrical engineer for the Short Electric Railway company, boilers, engines and generators have been fixed in a very substantial manner, and the three miles and more of track have been connected by means of electrical conductors in an extraordinarily short space of time, when it is considered that the rough material procurable in Bangkok constituted the only help means and appliances at his disposal. Arrangements were made for a preliminary run to test the efficiency of the plant on Monday night. The central station at Klong Padung was lit up with a number of incandescent lamps and the engines put in motion. As word had been spoken of a trial, a motley crowd, consisting of all nationalities, had collected to see the result. Excitement became intense when the lamps on the car were lit as if by magic, and shortly afterward the vehicle was seen to move. A preliminary run as far as the Oriental avenue and back proving successful, a few friends of the manager of the company stepped on board the car. A run at the rate of about 15 miles an hour soon brought the car to the end of the line, where other cars were to be seen under construction. Everything worked most smoothly, as far as the machinery was concerned, and the run was unanimously declared by all to be an unqualified success. An occasion of this kind could not be well ended without the usual christening, and this was done by the invited guests at the manager's house. The electric plant supplied by the Short Electric Railway company of Cleveland, O., arrived on November 16th last. The installation covers a distance of a little over three miles. The plant consists of two 80 horse power single cylinder automatic-cut-off engines, built by the McIntosh & Seymour Engine company, having a 13½ inch cylinder and a 12 inch stroke, working at 284 revolutions per minute. The engines are driven by steam conveyed from two horizontal tubular boilers, 16 feet long by 60 inches in diameter, having a working pressure of eighty pounds and supplied with water feed by a Worthington pump through a Jones feed-water heater. The furnaces are large and specially adapted for wood fuel. There are two generating dynamos giving 100 amperes of 500 volts each capable of being worked singly or in parallel. The electric current is indicated and controlled at a switch-board by instruments of the latest and most approved systems for governing the pressure and



NEW KENNELLY AMMETER.

connecting the dynamos, working either singly or in pair with the line. On the switch-board is a very clever device termed a circuit breaker, designed with a view to minimize risk. This ingenious invention guards against the possibility of a superfluous amount of electric current on the line, or on the trolley, by automatically cutting off the circuit and leaving the line free from current. The overhead wire consists of No. 2 hard drawn copper and is suspended by steel brackets and insulated hangers from poles at the side of the road. The entire length of 17,200 feet is in three pieces only, joined by two sleeve joints. The return current is conveyed through the rail, which have in this instance, owing to defective conductivity, been carefully connected by galvanized iron wire bonds passing through holes drilled in the extremities of each rail, and riveted. These bonds have in turn been soldered on to a supplementary wire running the whole length of the track and are connected with the switch-board at the central station. The cars, very solidly built of teak, are mounted on an all-iron truck, especially adapted for tramway service and carrying a 20 horse power motor. They are also fitted with five incandescent lamps of 16 candle power each."

New Kennelly Ammeter

This instrument, as shown in the cut, consists of a flat, horseshoe magnet, with its poles brought out into semi-circles, facing each other and separated by about 1-16 th of an inch. This large polar surface and narrow air gap make a magnetic circuit very nearly closed. It is well

FIG. 2. A NEW TROLLEY.

known that a solid anchor ring of steel uniformly magnetized around its circumference has no demagnetizing force, and therefore no tendency to alter its magnetization. A saw cut across such a ring introduces an air gap that establishes a demagnetizing magnetomotive force equal to the product of the flux and the air gap reluctance. As the air gap broadens and its reluctance rises, this back magnetomotive force increases, making the magnetic condition of the whole circuit more and more unstable, and rendering it more difficult to find a quality of steel that will have sufficient hardness and retentiveness to withstand this demagnetizing influence, while the narrower the air gap the more permanent and stable the magnetic condition must remain.

In the narrow space between the semicircular pole faces is pivoted a disk armature, as shown, the plane of the disk being parallel to the polar surfaces and midway between them. Starting from the center, the insulated wires forming the armature winding are laid radially and symmetrically over the upper surface of the disk, the accuracy of angular spacing being mechanically preserved. One half of the disk is completely covered by the pole faces and the other half projects beyond them. The spiral springs bring the measured current into and from the disk, acting at the same time as a restoring couple, as in the instruments of Cauderay and Gimingham of 1886. When the current passes through the armature an electro-magnetic pull is set up in the plane of the disk, urging it to right handed or left handed rotation, according to the direction of the current. As the disk moves in obedience to this force, as many radial wires enter the poles on one side as leave them on the other, so that the electro-magnetic force corresponding to the current strength remains uniform, while the retractive force from the spiral springs increases directly with the angle of displacement. In this way the angle through which the disk and its attached pointer move is proportional to the current strength, and the graduations of the scale are nearly uniform. The scale itself is wide, and covers an arc of about 125 degrees.

The shaft bearing the disk is pivoted on agates to reduce friction, and the whole armature complete only weighs a few grammes, so that it is not liable to be damaged in transport. The instrument will register in any position, but is most sensitive when resting horizontally. The total absence of iron from the armature insures freedom from hysteresis or magnetic lag. The instrument is very light, weighing six pounds in wooden case. It can be made in any capacity up to 100 amperes. It is not affected by the earth's magnetic force,

nor even by the stray field from dynamos beyond a few feet radius. Its resistance and inductance are very low. Its frame is strong and compact, being supported entirely on the magnet, which is again secured to the base with the intervention of soft rubber washers.

The instruments are all adjusted and standardized at the Edison Laboratory, by comparison with the standards there maintained. The scales are read off over mirrors to avoid parallax, and the movements of the needle are practically deadbeat. No ammeter of this type has yet made its appearance in which the magnetic circuit is so nearly closed, and this is the special advantage of the disk armature form.

A considerable advantage possessed by this form of ammeter is its independence of the distribution in magnetic flux through the armature. If this latter consisted of a spool or compact coil moving from one part of the field to another, under the influence of the current, the electromagnetic force, and consequently the deviation of the pointer, would depend upon the local intensity of the field at the point then occupied by the coil, so that accidental variations in the distribution of flux between the poles of different instruments would essentially produce corresponding variations in their scales. In this instrument, however, the winding is spread uniformly over the surface of the disk armature, which is only partly covered by the field, and consequently no movement of the armature within the range of indication can alter the relation between winding and magnetic field, however irregular the latter may be, for as many wires enter the field as leave it, and if any part of the winding is exposed to an unduly great or unduly feeble flux density at the outset, the same number of wires will always remain under that influence throughout the motion. This insures great regularity in the scales of different instruments and also insures a uniformity of any accidental error in the same instrument all over its scale.

The instruments are manufactured by the Edison Manufacturing company of 110 East Twenty third street, New York city.

Wiremen of the Chicago Edison Company Strike.

Last Monday about twenty or thirty wiremen employed by the Chicago Edison company quit work. This number represents the union element in the Edison forces in Chicago. The strike was ordered by C. A. Roff, of the National Brotherhood of Electrical Workers, who was at one time employed by the company, but, according to the authority of an officer of the company, was found incompetent and subsequently discharged. Some time ago the officers of the union asked the electrical contractors in Chicago to sign an agreement drawn up by the union, but the contractors refused to do so and the strike was ordered, although the men were for the most part satisfied and were receiving good wages. The Edison company is not troubled by the strike in any particular and is conducting its work as usual. New workmen will be secured to take the places of those who have left and the company expects no future embarrassment from its wiremen.

CORRESPONDENCE.

New York Notes.

New York, April 15.—The Board of Electrical Control, which has been pursuing the even tenor of its way for some time, created something of a sensation at its meeting this week, by adopting a resolution introduced by Mayor Gilroy providing that all electric light poles not erected in conformity with the rules of the board be removed from the streets. The order affects fully three-fourths of the posts now maintained by the companies. The rules of the board call for posts with cast-iron bases and wooden tops. Such poles have been erected in Broadway, Sixth avenue, Forty-second, Twenty eighth and a few other streets. In almost every other thoroughfare which is lighted by electricity the companies have put up plain wooden posts, much cheaper than the regulation posts, which cost about $50 each. After the meeting the representatives of the companies petitioned the mayor to give them a few days of grace to make the change. The mayor referred them to Secretary Moss who with Engineer Kearney will direct the removal of the objectionable poles. It was ordered that low-tension subways be built in One Hundred and Twenty-fifth street between First and Third avenues; in Sixty-fifth street, from Ninth to Eleventh avenues; in Seventh avenue, from One Hundred and Tenth street to One Hundred and Twenty eighth street for both sides of the street under the sidewalks. High-tension subways were ordered in Pearl street from John street to Hanover square; in Battery place from Greenwich street to West street; in Park place, between Greenwich and West streets; in Spruce street, between Nassau and William streets; in Avenue B, from Seventh to Fourteenth street; in University place, between Waverley place and Fourteenth street, and in Fourth avenue, from Fortieth to Forty-second street.

The bill providing for extending the term of office and salaries of the members of the Board of Electrical Control was passed by the Assembly Thursday night, and will probably become a law.

Rapid transit in accordance with the plan that was unanimously adopted on Wednesday afternoon by the commissioners appointed for that purpose seems now to be in sight. It is almost certain that the Manhattan Elevated Railway company will accept the conditions and build the extensions. The only serious question likely to be raised is over the compensation that the road shall pay the city for its increased privileges. It is estimated that at present the Manhattan Elevated Railway company is paying into the city treasury annually about five per cent. on the net receipts for half of its system. If it complies with the commissioners' plan and conditions it must pay the city five per cent. on its net receipts for its whole system. In addition to this the company must pay the expenses of the commission, which will be about $250,000. Comptroller Myers said recently that he approved of the five per cent. tax stipulated for. It means, he said, five per cent. of the gross receipts, less taxes and operating expenses. "In this sense of the term 'net receipts,'" said the Comptroller, "it seems to me that five per cent. is a just compensation to the city for the privileges that it grants. There can be no evasion of these payments. We know what the operating expenses and the taxes now are, and when the extensions are in operation it will be easy to calculate what the city shall receive."

Commissioner Starin still clings to his theory that the underground railroad is the best scheme for rapid transit.

"I do not intend to abandon the idea of an underground road," he said. "I shall continue to advocate it and do what I can to secure such a road."

R. T. Wilson said that he was glad that the present facilities were going to be increased. He would not say, however, that he had given up his scheme for an underground road.

Should the Manhattan company accept the plan drawn by Mr. Spencer, there will be very little delay in complying with its provisions. It would probably take about six months to comply with the legal requirements before the road could begin constructing its extensions. The company will have to present to the commission plans and specifications to be approved and submitted to the mayor and municipal authorities for endorsement. Then the work may begin.

The Supreme Court of this state has decided that municipalities may levy taxes on telegraph and all other poles erected in the streets to carry the wires of telegraph or telephone or electric light companies. The decision is an important one, because it opens to cities and villages a new source of revenue, the exaction of which will tend to cause the removal of overhead construction.

Another feature of the local telephone controversy, and one that will not please the subscribers, is the discovery made by the *Herald* that relief through the establishment of rival companies in this city is hardly possible. Aside from the merits of the patent claims which the Bell company presents, it will be impossible to establish a system of underground wires without building new conduits throughout the city. While the law forbids the company owning the conduits to refuse the admission of other companies, the Bell company, which controls those already built, has filled them with its own cables, or nearly so, and it is not believed that the people will again submit to the tearing up of the streets for the purpose of building new conduits.

At a meeting of the State Railroad commission yesterday the West Chester Electric Railway company applied, through Lawyer Charles Strauss of this city, for permission to use the trolley on its lines, which run from Yonkers to Mount Vernon, from Mount Vernon to Pelham, from Pelham to New Rochelle, from New Rochelle to Glen Island, and from Mount Vernon to South Mount Vernon, and thence to Woodlawn, in all about twenty miles. C. W. H. Arnott of Poughkeepsie, filed a petition for authority to operate the New Paltz and Highland electric road by the trolley system.

The Edison Electric Illuminating company of New York yesterday filed with the secretary of state at Albany a certificate showing that it had increased its capital stock from $6,500,000 to $10,000,000. It is stated that the amount of capital paid in is $6,500,000, and that the whole amount of the debts and liabilities of the corporation is $3,500,000.

W. F. O.

Northwestern Notations.

Minneapolis, April 15.—A party of prominent electrical men from Pittsburg, Pa., visited Minneapolis and St. Paul last week for the special purpose of examining the cable conduit system. They seemed well pleased with what they saw. The party was composed of F. E. Degenhardt, of Chicago, who superintended the putting in of the Minneapolis system; G. W. Blaxter, vice-president of the Allegheny Electric Light company; Mr. Mead, chief of the bureau of electricity at Pittsburg; J. W. Willock and J. E Ridall, capitalists.

The wild storm that swept over the Northwest early this week was disastrous to all companies dependent on electricity. Reports from the towns throughout the state indicate that in many cases electric plants were considerably affected, but only temporarily. The telegraph companies here reported much disturbance all along their northwestern lines. In both Minneapolis and St. Paul the street car companies were bothered by the storm, but maintained their service. Several motors were burned out.

The Minneapolis aldermen are having a siege over the question of the proposed street railway station at Bridge Square. The legal right of the city to give this piece of public property for the use of the company without adequate compensation is called in question. The city attorney holds that it cannot be done. The company proposes to put up a regular depot building and believes it will prove a great public convenience.

Sixteen handsome open cars for the Minneapolis service are due this week from St. Louis.

N. L. P.

New England Notes.

Boston, April 15.—Rapid transit in Boston begins to take on a little more palpable shape. The legislative committee which has this matter in charge met on April 12th at the state house and listened to the reading of a bill which proposes to establish an elevated road in Boston. It is expected that this bill will soon be introduced in the Legislature. It authorizes the construction of an elevated road by a corporation to be known as the Boston Elevated Street Railway company; capital stock, $25,000,000, of which $2,000,000 is to be paid in before work is begun. The bill provides for the construction of an elevated double track road from Causeway street to Scollay square, either through existing streets or over land to be acquired by the company; thence along Tremont street to Shawmut avenue; from the junction of these two streets to Dudley street, either over widened streets or through private property; thence it will be extended to Roxbury if it be a success. It is to be operated by electricity. The board of aldermen of Boston is given the power to grant the location from Causeway street to Dudley street. The company is to pay no taxes except those authorized by the state. It is provided that the company may pay 8 per cent. dividends out of its net earnings, but one-half of all above 8 per cent. shall be paid to the city of Boston. The city has the option after twenty years of purchasing the property. The location is to be determined before December of the current year. The incorporators of the company will be the incorporators of the West End Street Railway company. It is intended that the city shall widen Tremont street from Scollay square to Shawmut avenue at its own expense. This bill will undoubtedly be considerably amended before it passes the Legislature, but it is important as furnishing a ground work for discussion.

Prentiss Cummings appeared for the West End Street Railway company at a hearing before the Legislature on rapid transit recently and detailed the objections his company had found against the operation of cars by storage battery. He said: "The trouble with storage batteries is that they are too heavy and bulky. In Milford only 16-foot cars have been introduced, which were thoroughly tried by the West End company and found wholly useless in a few weeks, becoming only old scrap iron and costing four times their earnings to operate. To have a motor large enough to handle a big West End car would take another car to carry the battery. Some much smaller and more powerful battery must be invented before it will be successful in handling such cars as the West End company uses." Mr. Cummings declared that the Hopedale & Milford Street Railway company was backed by a West Virginia corporation, with a capital stock of $5,000,000, of which $4,999,300 had been contributed in patent rights and personal property leaving only $700, which had been paid in. He said also that its annual statement was a made-up affair and that on the basis of business as reported by them the West End company would require 7,000 cars, costing $28,000,000 and $14,000,000 extra to house them and a total increase of $60,000,000 capital to put it on the same basis as the Milford road so it could use storage battery system. J. C. E

PERSONAL.

William B. Roberts, general manager of the Rockford Electric Manufacturing company, Rockford, Ill., was in Chicago last week.

C. McL. Paine, formerly connected with the New York office of the WESTERN ELECTRICIAN, has assumed the business management of the *Architects' Electrical Bulletin*, New York, a publication issued monthly by the Interior Conduit & Insulation company. Mr. Paine's experience should prove valuable to him in his new position.

B. F. Hamilton, of the Sawyer-Man Electric company, New York, will receive the sympathy of his many friends on the death of his father, E. J. Hamilton. Mr. Hamilton was manager of the real estate department of the Equitable Life Assurance Society, and was for 45 years a member of the Olive Branch Lodge of Odd Fellows, Harlem, N. Y.

T. Ahearn of Ottawa, Ont., was in Chicago last week. Mr. Ahearn was returning from an extensive trip through Mexico, Central and South America. Very little progress has been made in these countrys in electrical work, according to Mr. Ahearn, and the political complications which are constantly occupying the public mind greatly retard industrial development.

NEW INCORPORATIONS.

Atwater General Electric company, Cleveland, O.; capital stock, $14 000; manufacturing electrical apparatus; E. B. Davidson, Cleveland, O.

Rockbridge Hotel & Railway company, Glasgow, Va.; capital stock $200,000; operating hotels, electric or steam railway, water and electric plants.

Canton-Salem Electric company, Canton, O.; capital stock, $30,000; furnishing electricity for light and power purposes; A. A. Thayer, Canton, O.

Houston General Electric company, Houston, Tex., capital stock, $30,000; to manufacture all kinds of electrical apparatus, machinery and supplies; Scott Van Etten, Houston, Tex.

Vergennes Electric company, Vergennes, Vt.; capital stock, $21,000; constructing and maintaining works for the manufacturing, furnishing or selling of heat, light and power by electricity.

Mackay Electric Reciprocating Tool company, Portland, Me.; capital stock, $1,000,000; to manufacture, operate and deal in electric machinery, apparatus, devices, etc.; F. V. Chase, Portland, Me

National Metal & Electrical company, Cleveland, O; capital stock, $25,000; manufacturing and dealing in metal, electrical and mechanical appliances, hardware, etc.; Frank A. Strong, Cleveland, O

Crescent Electric Light company, McKees Rocks, Pa.; capital stock, $25,000; supplying light, heat and power in McKees Rocks, Allegheny county, Pa.; Frank Thompson, 413 Grant street, Pittsburg, Pa.

Berlin Building company, Tacoma, Wash.; capital stock, $115,000; to deal in real estate and to erect buildings; to own and operate elevators, gas and electric light plants, etc; Hudson & Holt, Tacoma, Wash.

Delaware & Schuylkill Railway company, Philadelphia, Pa.; capital stock, $50,000; constructing and operating an electric railway in Philadelphia, Pa; Hugh Mullen, 6942 Keystone street, Tacony, Philadelphia, Pa.

Denver Novelty Works & Manufacturing company, Denver, Colo.; capital stock, $15,000; to manufacture and sell stamps and stencils of rubber, brass, steel, copper, etc.; and also electric goods of all kinds, etc.

Montana Electric company, Butte, Mont.; capital stock, $50,000; to carry on a general electric business, general electric construction business, general electro-plating business, and dealing in electrical machinery.

Gladwyne Electric Railway company, Gladwyne, Pa.; capital stock, $12,000; constructing and operating an electric railway in Lower Merion township, Montgomery county, Pa.; Hugh W. Barrett, Bryn Mawr, Pa.

Allegheny Valley Street Railway company, Parnassus, Pa.; capital stock, $15 000; constructing and operating an electric railway in Westmoreland county from Parnassus to New Kensington, Pa.; John T. Reeves, Beaver Falls, Pa.

Millbury, Sutton & Douglas Electric Railroad company, Millbury, Mass.; capital stock, $200,000; to own, manage, construct and operate an electric railroad to run through the towns of Millbury, Sutton, Manchaug and East Douglas to Douglas.

Electro-Hydrogen Lighter company, Jersey City, N. J.; capital stock, $100,000; to manufacture, purchase, deal in and sell mechanical devices or apparatus for generating heat and light, etc.; Wm. T. Hardenbrook, 103 Potter building, New York, N. Y.

Dundee Rapid Transit company, Dundee, Ill.; capital stock, $50,000; to operate street railways and do general transportation business and furnish light, heat and power, deal in electrical supplies and general manufacturing business; E. C. Hawley, Dundee, Ill.

Citizens' Telephone Company of Quincy, Quincy, Ill.; capital stock, $100,000; to construct and operate a telephone exchange in Quincy, Ill., and between other towns in Illinois, Iowa and Missouri and Quincy; to manufacture and deal in all kinds of electrical goods and supplies; J. F. Carrott, Quincy, Ill.

Indiana Natural & Illuminating Gas company, Indianapolis, Ind.; capital stock, $1,000,000; to prospect, bore and drill for, and to manufacture natural and artificial gas, and to sell and supply same for light, heat and power; and to that end said company may acquire, hold, use and enjoy, sell and mortgage real estate and natural and artificial gas and electrical plants.

Sutton-Steel Electric Manufacturing company, Dallas, Tex.; capital stock, $100,000; manufacturing and selling electrical and other machinery; electrical and other apparatus, appliances, etc.; street railway supplies, and also of placing, constructing, operating or selling ice, water, electric light and power plants and other systems of improvement; N. A. Searcy, Dallas, Tex.

ELECTRIC LIGHTING.

Clyde, O., is negotiating for an electric light plant.

Knoxville, Ill., is to have an electric lighting plant.

An electric light plant is being put in at Franklinville, N. Y.

An addition is to be built to the electric light plant at Wellsville, O.

A company has been formed to build an electric light plant at Redruth, Mich.

The Legislature has authorized Milan, Tenn., to establish an electric light and water works plant.

An electric light plant is to be located at Colebrook, Md. The capacity of the dynamoes will be 600 lights.

The question of establishing an electric light plant for lighting the city of Falmouth, Ky., is being agitated.

A Thomson-Houston electric light plant will be installed in Newark, O. Work will be commenced on the plant at once.

The city council of Hawarden, Ia, has granted a franchise to a company to light the city with electricity and to do commercial lighting.

Baltimore capitalists contemplate putting in an electric light plant at Kennett Square, Pa., with lights extending to West Grove, which is also to be lighted with electricity.

The Edison Electric Light company of New York has been awarded the contract for placing an additional lamp in each block on Fifth avenue, between Waverly place and Fifty-ninth street.

The Pontiac, Ill., Electric Light, Heat & Power company (capital stock, $40,000,) has been incorporated. Henry A. and A. P. Foster and C. M. Hamlin are the proprietors of the enterprise.

Women are beginning to take part in electrical matters in Paris, France. Mesdames Henriette Goulard and E. Garnier Goulard on March 7th addressed a petition to the municipal council, asking for a concession for an electric light scheme on the left bank of the Seine at Paris.

The Neptune Electric company of Asbury Park, N. J., has completed its new building. The company has added a new 600 horse power Corliss engine. The equipment of the plant will be five Thomson-Houston 50 arc machines and four dynamos capable of producing 5,000 incandescent lights.

The Mutual Light company of Alliance, O., is a consolidation of the Alliance Gas Light company, the Mutual Electric Light company and the lighting department of the Alliance Street Railway company of the same place and has the exclusive contract for lighting the city for several years. The company owns a large plant and has in operation 3 boilers, 66 inches by 16 feet, 2 Russell engines, 125 and 150 horse power, 6 arc dynamos, 245 arc lamps and 1 Wood 1,500 light incandescent dynamo. The authorized capital is $150,000, and the officers of the company are Elisha Teeters, president, W. W. Cantine, secretary and treasurer.

ELECTRIC RAILWAYS.

The Nassau Electric Railway company, Brooklyn, N. Y., has been granted franchises for important extensions on its lines.

The Cicero & Proviso, Ill., Electric Railway company will extend its line to Maywood and Melrose, and also in other directions.

The promoters of the forty-mile electric road from Nevada City to Marysville, Cal., have received franchises from both places.

The Mt. Vernon, Pa., Electric Street Railway company, capital stock, $24,000, has been incorporated to build a four mile line.

An electric railway will probably soon be built from Macon, Ga., to the property of the Ocmulgee Land & Improvement company.

The Roanoke Street Railway company, Roanoke, Va., has commenced the work of changing the Salem dummy line into an electrical railroad.

The Baltimore City Passenger Railway company will shortly commence the work of equipping several of its lines for operation by electricity.

The electric railway lines now under construction in Ohio amount to nearly 400 miles in length, for the most part being in the northern section of the state.

The Everett & Snohomish Electric Railroad company has been granted a franchise for the construction of a road running from Marysville, Wash., to Everett via Snohomish.

A bill is pending in the Legislature of Ohio to enlarge the power of electric railway companies, permitting them to carry United States mails, express packages, baggage and freight.

In New Jersey electric street cars which are divided into two compartments have been introduced. A first-class fare is 6 cents, while 5 cents pays for a ride in the ordinary compartment.

The Santa Clara county supervisors have granted a franchise for an electric road in Santa Clara, Cal., from the junction of Delmas avenue and San Fernando street to the narrow gauge depot.

The Common Council of Providence, R. I., has granted the Union Railroad company permission to operate electric lines on several of the streets of the city and a number of extensions have been planned.

An electric line between the two great summer resorts, Camden and Atlantic City, N. J., is proposed. A route has been selected, estimates prepared, capital pledged, and a preliminary organization will soon be made.

The city council of West Duluth, Minn., has passed a resolution instructing the Duluth Street Railway company to put in operation a double track electric street railway on Grand avenue from its present terminus to the eastern village limits.

An enterprise which has been under way for some time and now bids fair to be accomplished is the construction of a boulevard and an electrical railroad between the cities of Baltimore and Washington. At present there are two distinct syndicates moving toward this end. One is composed of capitalists, including Messrs. Widner, Elkins and others, interested in the Philadelphia and Baltimore Traction companies. The other is made up of several companies that intend building electric railroads between points along the route a line from Baltimore to Washington would take. It is proposed to consolidate these lines, filling in the necessary connecting links. The promoters of this project include Baltimore, Boston and New York capitalists. The Traction syndicate is moving quietly in the matter, but has made substantial progress, and has already obtained lines in Washington and Baltimore with which the new road would connect.

MISCELLANEOUS.

The reappearance of the electric carriage on the streets of Chicago last week created almost as much amazement as its first appearance. The carriage was propelled through the principal business streets and attracted attention everywhere.

Lightning played terrible havoc last week in Battle Creek, Mich. L. M. Hardenberg's residence on Upton avenue was struck and damaged $800 by fire. Two other houses and a school house were also damaged by a bolt. All the electric motors of the street car company were badly burned, besides several telephones and electric lights. Many people were prostrated by the shocks.

The application of electricity as a motive for ringing church chimes will shortly be introduced in St. Alphonsus church, Baltimore. An electric key-board having wire-connected with the chimes somewhat resembling that of a piano will be placed in the choir gallery where the operas tor will sit. He will be able to play his ponderous chimes by this plan as easily as the church organ.

A number of capitalists of Butte City, Mont., are planning to utilize the water power of the Big Hole river for operating machinery to generate electricity for all purposes in the city. The Big Hole river is only thirty miles from Butte City, and the fall at the point from where the water would be taken, it is claimed, is sufficient to operate machinery of any dimensions, at an estimated cost of $1,000,000.

"The Bolivian government," said Amos J. Thomas, "recently attempted to establish a telephone line between Lapas and Lake Titicaca, forty-five miles apart. It was torn down and destroyed so frequently by the Indians that the government was compelled to abandon it. The electric light plant in Lapaz was preserved by adopting an ingenious method of overawing the natives. After the plant had been in operation but a few nights it happened that there was an eclipse of the moon. The superstitious Indians believed that the electric light was absorbing or swallowing the moon. They gathered in a large body at one quarter of the town and moved upon the plant to destroy it. It was saved only by the intervention of a large body of troops. The government the next day selected several representative Indians, took them to the power house, shocked them severely, then took them out along the line and shocked them again, and informed them that the electric light was an evil spirit and that they had better leave it alone. Since then they have had no trouble on that score."

TRADE NEWS.

The Nowotny Electric company, Cincinnati, O., manufacturer and dealer in electric light and street railway supplies, has been appointed exclusive agent in Ohio for the Meston alternating fan motors and the Chicago Electric Motor company's direct current fan motors.

The model of the Lundell fan motor embodies a self-oiling and self-aligning bearing. The new design of the fan stand gives the outfit an artistic appearance, and the black japanned finish is proving popular. This new model is a striking exposition of the character of the electrical novelties of the Interior Conduit & Insulation company.

The K. W. rosette and branch block patent of the Bryant Electric company of Bridgeport, Conn., has been sus-

tained by the United States Circuit Court of Massachusetts in the action instituted against the Consolidated Electric Manufacturing company. A permanent injunction was granted and the court ordered an accounting for back royalties and damages.

G. d'Infreville of New York, manufacturer of the wasteless gravity zinc for batteries, last week received an order from the American Telegraph & Telephone company for several thousand of his batteries to be used on long distance lines. On account of increasing business he has decided to move on May 1 to 10 Desbrosses street, New York, where he will double his facilities.

The Edison Manufacturing company, 110 East Twenty-third street, New York, is just at present pushing its iron clad battery and fan motor outfit with considerable success. This motor outfit is known as the "Q" type, and is noiseless, has self-oiling bearings, and is entirely inclosed in an iron-clad case, being provided with a glass window at the rear for regulation of brushes. The workmanship is of the very highest grade.

President H. C. Adams of the Phillips Insulated Wire company of New York last week closed a contract for the wiring of a 400 arc light plant of the Fort Wayne Electric company's system with the town of Gravesend, Kings county, N. Y. The "O K." weatherproof wire will be used throughout the whole system. Mr. Adams also has taken an order for several miles of the same wire for the Neptune Electric company of Asbury Park, N. J.

The Case automatic high speed engine is described in an illustrated catalogue which has been recently issued by the manufacturer, the J. T. Case Engine company of New Britain, Conn., which claims for the engines a type of construction permitting of the adoption of the fewest working parts, and these of the highest weight, resulting in the attainment of high speed without injurious vibration. Simplicity and compactness are the points aimed at.

The Ball & Wood company of New York is the first company to have its exhibit complete in machinery hall, at the World's Fair, under the supervision of its engineer, Mr. Wyckoff, and it is already attracting much attention. It consists of two standard simple engines of 150 horse power each; two 150 horse power tandem compound engines, and one 200 horse power cross compound engine. These engines are connected with Brush dynamos. The business of the Ball & Wood company in Chicago will be conducted by W. B. Pearson and Thomas C. Perkins.

The Ansonia Electric company, Chicago, has just sent out to the trade some very handsome plates illustrating special electrical fixtures which this company is introducing. These plates are intended for preservation, in order to aid customers in making future selections, and they are gotten up in very attractive form, handsomely bound and substantial in every respect. The fixtures illustrated are certainly very attractive and they combine many novel features. The company will make a specialty of ornamental fixtures, and it will not only carry a line of standard types, such as those shown in the plates, but it will furnish special designs when preferred.

President George Lockwood of the Fitch Excelsior Switch company of New York is in receipt of many congratulatory letters of recommendation for the automatic switch for electric and cable cars. A. D. Moulton, general manager of the Steinway Railway company of Steinway, L. I., says that after a thorough and exhaustive trial in all kinds of weather during the last two weeks, he is perfectly satisfied with the working of the switch. "It does its work surely and with perfect ease. It is remarkable for its simplicity of construction and ease with which it does its work. I fully recommend it to any one desiring the best switch in the market."

The Ansonia Electric company of Chicago has furnished an expensive suite of rooms at the company's headquarters, corner of Michigan avenue and Randolph street, for the benefit of its friends and customers during the World's Fair. These rooms will be supplied with all conveniences, including telephone and messenger service. Carriages may be ordered, theater tickets purchased and appointments made to meet friends in these rooms. A piano will be placed in the ladies' parlor, and gentlemen may amuse themselves in the reading, smoking and writing rooms, or at the pool tables. Letters may be written from dictation by stenographers; a private postoffice will be established, and it is desired by the company that its friends arrange to have their mail received at these rooms. Private lockers in which baggage and other things may be placed, a coat room, and in fact all the conveniences of a modern club room will be at the disposal of the guests. There is no doubt but that this evidence of enterprise on the part of the Ansonia Electric company will be appreciated, as the World's Fair city will certainly be thronged to its fullest capacity until the close of the exposition.

Ampere is the name of a distinguished French physicist and electrician, who at the beginning of the present century enunciated some of the leading principles and theories in electricity. At the Paris Electrical Congress of 1881 the word was adopted as the name for the unit for measuring quantity of electricity. This unit, the most important in all power measurements, has already become familiar and highly useful in all electric light and power work. For this reason the Crocker-Wheeler Electric company, which is doing a large business in the construction of dynamos and motors for all classes of work in which power is the needed element, has established new and enlarged works at a suburb of Newark, N. J., and have name the place Ampere. A railway depot named Ampere has also been established for the company opposite the entrance to the works, on the Montclair branch of the Delaware, Lackawanna & Western railroad, and as hundred of employes are now settling there, the town will undoubtedly soon be one of the busiest industrial centers in New Jersey—as noted for its electrical machinery as Trenton is for pottery. Ampere is directly connected with the Taylor building, No. 39 and 41 Cortlandt street, New York, where the general offices of the Crocker-Wheeler Electric company are located by means of the telegraph and the long distance telephone. It is 11 miles from New York.

BUSINESS.

It would be of advantage to those who use lubricating preparations to any extent to peruse the book recently published by the Joseph Dixon Crucible company, Jersey City, N. J., advertising its Ticonderoga flake graphite. The company claims for this substance that it is unexcelled for reducing friction in working parts of engines and machinery, and for lessening wear and tear and breakage in joints, gaskets, bolts, etc. The book mentioned, as well as a sample of the graphite, will be mailed upon application.

The Ansonia Electric company, Chicago, announces that from all the large stations into which it has introduced the Wirt indicator it has received additional orders. It has been proven, the company claims, that the use of the Wirt indicator makes a positive saving in lamp bills, which in many cases will pay for itself in a short time; it is therefore not a luxury but an actual economy. The Wirt dynamo brush made by the same company is also rapidly winning its way into the favor of conservative and careful station managers.

H. W. Knight & Son, of Seneca Falls, N. Y., have made pattern letters and figures for thirty years, and their long experience gives them a firm hold on the trade, and enables them to lead in their line. All their letters are cast, and finished by hand. They constantly have on hand 2,000,000 letters and figures in their stock. Of some of the smaller sizes of which there is a large demand, they have 30,000 finished and ready to ship. This enables them to fill all orders the same day received. Some of their hair line letters are so small that it takes 10,000 to weigh a pound, while others weigh 20 pounds each. They have agencies established all over the United States, also in Europe. Address them for their catalogue, drawer 1256.

As has already been announced the three aisles of machinery hall, at the Exposition, are covered by three electric traveling cranes, one in each, the central space being covered by the crane built by the Vale & Towne Manufacturing company. The latter machine has been in constant and active operation, handling heavy materials, and placing exhibits, both day and night, since the middle of December, 1892. Not only has its own intended duty been performed with entire satisfaction, but it has been compelled to assist in the handling of the exhibits and materials for the side arches, pending the completion of the cranes in those aisles. If further proof is needed of the value of electricity as a motive power for traveling cranes, when combined with proper design and workmanship, it is amply afforded by the successful manner in which this crane has performed its functions under the excessively severe duty to which it has been subjected.

ELECTRICAL PATENTS.

Issued April 11, 1893.

495,026. Spool for Electric Coils. George W. Demmick, Lynn, Mass.

495,030. Means for Telegraphing. William H. Fahrney, Chicago, Ill.

495,035. Electric Railway Trolley. Frank Heath, Minneapolis, Minn.

495,038. Multiple Thermal Cut-out. Warren S. Hill, Boston, Mass.

495,046. Electrical Motor. August Knoche, Elberfeld, Germany.

495,047. Electrical Indicator for Rudders. Charles V. Knowles, Somerville, N. J.

495,058. Commutator Connector. Edward D. Priest, Lynn, Mass.

495,071. Compressed Air Apparatus. Elihu Thomson, Swampscott, Mass.

The invention is designed to increase the efficiency of compressed air apparatus. Taking advantage of the fact that air becomes exceedingly cool and its effectiveness as a motive agent is greatly reduced in expanding from the normal temperatures, and that by heating the air before it goes to the motive device it may be worked with greater efficiency, an electric heater is placed in heat conductive relation with the air supply, whereby the air in passing to the motive device is heated to a temperature considerably above the normal.

495,077. Electric Arc Lamp. Addison G. Waterhouse, Hartford, Conn.

495,086. Voltmeter and Ampere Meter. Eugene Gengenbach, Schenectady, N. Y.

The meter comprises a sheet of magnetic material rolled into the form of a cylinder, the sheet having one end broader than the other before rolling, so that after being rolled into the form of a cylinder the length of the surface gradually diminishes in passing around its circumference. Encircling the sides of this cylinder in such a manner that the rolled plate threads through it is a closed loop of magnetic material, which is adapted to rotate about the axis of the cylinder. Surrounding the whole is a solenoid through which passes the current to be measured. The passage of the current induces poles in the coiled plate and in the closed loop, and like poles being at the same end, the loop and plate repel each other, thus causing the loop to move in such a direction that the distance between its inner end and the edge of the rolled plate will be a maximum, which motion is resisted by the tension of a spring.

495,087. Central Office Apparatus and Circuit for Telephone Exchanges. Edward J. Hall, Morris, N. J.

495,090. Granulated Material for Transmitting Telephones. William W. Jacques, Newton, Mass.

The granulated material which is adapted for use in transmitting telephones of the Hunning type has a high microphonic power, that is, ability of the electrodes to move a great distance apart without breaking the contact, and at the same time it possesses a low resistance. The material is formed by coating grains of carbon with powdered alumina and subjecting the coated grains to an intense white heat in an inert atmosphere.

495,107. Electrode for Secondary Batteries. George D. Coleman, Chicago, Ill.

The electrode is formed by blowing or showering finely divided molten lead, or other analogous metal or material within a closed housing, into a suitable mold; the relative distances of the blowing device and the receiving mold being such that the finely divided and molten particles of metal will reach the mold as they are attaining their point of congelation, so that the particles will merely weld together at their points of contact to form a coherent mass of great porosity.

495,125. Electro-magnet. Simon H. Stupakoff, Pittsburg, Pa.

To overcome the difficulty caused by the retention of the keeper of an electro-magnet after the exciting current has been removed, due to the residual magnetism, a small strip of magnetic material is interposed between the keeper and the core, the cross section of the strip being such that it is insufficient to convey many of the lines of force, but which acts when the exciting current is withdrawn to furnish a path for most, if not all, of the lines of force due to the residual magnetism, thus causing the keeper to immediately fall away.

495,127. Electric Annunciator System. Edmund R. Wilder, Kansas City, Mo.

495,136. Commutator Brush. Karl Koch, Elsey.

495,138. Magneto-electric Machine. Joseph N. McLeod, Brooklyn, N. Y.

495,139. Magneto-electric Generator. Joseph N. McLeod, Brooklyn, N. Y.

495,193. Railway Danger Signal. Arthur W. Berne, New York, N. Y.

495,225. Potential Indicator. George A. Lintner, Minneapolis, Minn.

The potential indicator comprises a solenoid, to the core of which is attached the pointer or index which carries a contact point adapted to make contact with a stationary contact point, when the pointer indicates a pre-determined maximum or minimum potential, thus sounding an alarm.

495,229 System of Electric Conversion. Edwin W. Rice, Jr., Lynn, Mass.

495,240. Incandescent Lamp. George H. Benjamin, New York, N. Y.

The lamp comprises a bulb provided with a neck and a plug adapted to fit in the neck, a wire being wrapped around the plug in a channel provided for the purpose, the ends of the wire protruding from the end of the lamp in order that a current of electricity may be sent through the wire after the plug has been fitted in position to heat the wire and cause a union between the wire and the material of the plug and bulb.

495,287. Electric Alarm Clock. Thomas P. Adams, Rico, Colo.

495,306. Galvanic Battery. Clyde J. Coleman, Chicago, Ill.

495,318. Globe Holder for Arc Lights. Thomas H. Faben, Toledo, O.

495,321. Electric Street Railway Sweeper. John W. Fowler and John Hutton, Brooklyn, N. Y.

495,383. Overhead Contact Device and Switch. Charles J. Van Depoele, Chicago, Ill.

495,394. Machine for Electrically Welding Metals. Charles L. Coffin, Detroit, Mich.

495,443. Traveling Contact for Electric Railways. Charles J. Van Depoele, Chicago, Ill.

The trolley supporter carrying the trolley wheel upon its end is pivoted so that it may swing freely around a vertical axis.

495,456. Conduit Electric Railway. William R. De Voe, Shreveport, La.

495,461. Electric Arc Light. Rudolph M. Hunter, Philadelphia, Pa.

The arc lamp is of the form known as search lights, the positive carbon occupying a horizontal position and the negative carbon a position at right angles thereto, the crater formed in the end of the positive carbon furnishing an intense light, which, instead of being directed upon the reflector, is directed upon condensing lens, which bends the rays to a parallel or nearly parallel position before projecting them. The changing of the direction of the beam of light, instead of being accomplished by moving the whole lamp upon a ball and socket bearing, is effected by shifting the position of the condensing lens, changing its angularity with relation to the rays emanating from the crater, and consequently shifting the direction of the rays projected from the condensing lens.

495,463. Electric Arc Lamp Carbon. George M. Lane, Asbury Park, N. J.

The carbon electrodes comprise two carbon pencils united by a web of carbon, the whole being formed in one mold. One of the pencils is made somewhat longer than the other, the arc being first formed between the longer pencils of the pair of electrodes. When the arc has sufficiently consumed this pencil it becomes shorter than the second pencil, and the arc gradually shifts by means of the web to the second pencil, thus establishing the arc through the second pencil. The shifting of the arc takes place from time to time as the lengths of the pencils change, thus furnishing a carbon electrode of long life.

495,467. Incandescent Lamp. Henry Green, Hartford, Conn.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY and MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

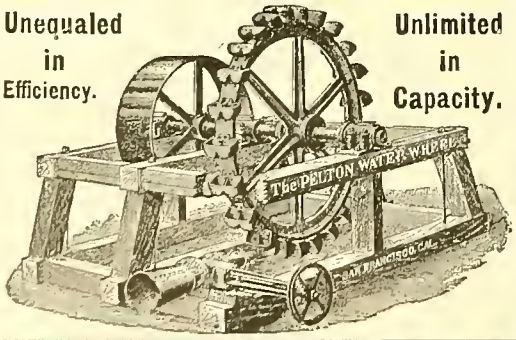
THE PELTON WATER WHEEL.

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency. Unlimited in Capacity.



Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into especial prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

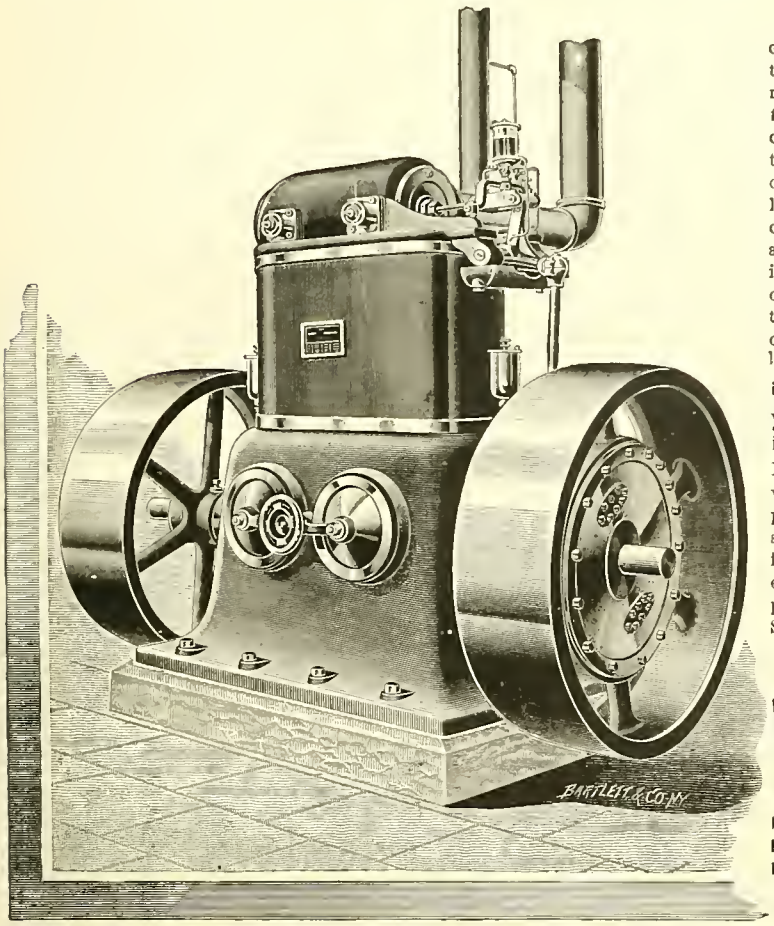
A PLAIN STATEMENT OF FACT.



The Compound Engine, when non-condensing, so far from possessing an economy superior to the Simple Engine, has been decisively proven, "much to the disgust of the stockholder," to show normal economy only at or about its rated power, and to fall off in economy faster than a Simple Engine as the load falls off; moreover, very much faster under the extreme light loads that are common in Electrical Generation. This point is at last reluctantly admitted by the more candid builders of such engines, most of whom now advise against compounding for variable loads. The reason is in their inability to divide the load and range of temperature proportionately and automatically between the cylinders at all points of cut-off. Hence, the low-pressure cylinder expands its steam below atmosphere under a moderately early cut-off, thus converting itself into an Air Pump, and becoming a load upon the high-pressure cylinder instead of a co-laborer with it. This point was distinctly foreseen by the designers of the Westinghouse Compound Engine, and an entirely new principle was worked out, making expansion below atmosphere impossible under any load, however light. **For the first time in the history of Steam Engineering, either Simple or Compound, is built an Engine which maintains essentially uniform economy, irrespective of load,** and hence for the first time the Compound Non-condensing Engine has been made practicable. The results, demonstrated by test, show that where an ordinary Compound will range from 25 lbs. to 70 lbs. water per H. P per hour from full to quarter load, the Westinghouse Compound, between the same limits, will range from 23 lbs. to 29 lbs. We have not deceived ourselves in this matter, and propose that the facts shall be understood. To those interested in the nicer points involved, we will be pleased to send a reprint of the paper read by Mr. F. M. Rites on this subject at the late meeting of the American Society of Mechanical Engineers, at San Francisco.

NEW BOOKS! — JUST OUT OF PRESS.

NEW
DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages. 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

SEND IN YOUR ORDER.

CALLS ATTENTION TO ITS NEW

"Wood" Iron-Clad Slow Speed Alternator.

This Alternator contains the following features of merit: It has the highest electrical efficiency; the best mechanical construction; the most artistic design, and the best ventilated armature ever constructed. The armature is in fact indestructible. These dynamos are being manufactured in the following sizes: 750 light, 1,500 light, 3,000 light and 6,000 light capacity. This Iron-Clad Alternator can be seen in operation at our exhibit at the World's Fair.

HAVE YOU EXHAUST STEAM GOING TO WASTE?

Are your FEED WATER HEATERS obtaining the best results, in heating and purifying the feed water for your boilers? Are you heating your buildings with live steam or exhaust?

IF YOU DESIRE TO GET BETTER RESULTS from your present feed water heaters, and to heat your building by exhaust steam, without back pressure upon engines, saving power and water of condensation, together with GREATER ECONOMY IN FUEL, send for our catalogues of Webster Vacuum Feed Water Heater and Purifier, and Williams Vacuum System of Steam Heating, which contains some of the largest plants in the United States as references. We visit plants in any part of the United States, at our expense, furnish our apparatus, which may be attached to your present plant, upon trial, under guarantee.

Patentees, Proprietors and Manufacturers of the Webster Vacuum Feed Water Heater and Purifier.

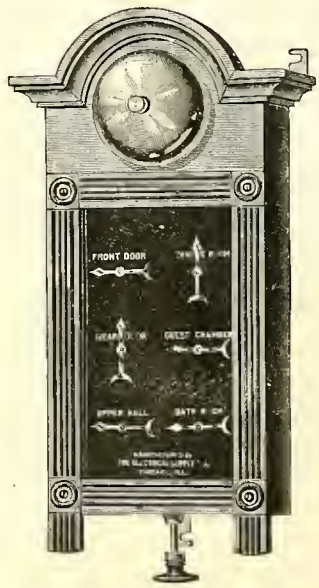
No. 6 .

The... Diamond... Carbon Battery

Has the least internal resistance of any open-circuit battery on the market. The carbon pencils are made of the celebrated Diamond Brand. The arrangement of the elements gives the greatest amount of carbon surface.

No Rubber is necessary around the zinc rod to hold it from contact with the carbons. The composition top is so constructed that when "set up" it practically seals the cell, thus preventing evaporation and largely increasing the life of the battery.



No. 682.

The Ansonia Gravity-Needle Annunciator.

Never sticks or catches. **It always works.** Each needle has a double armature, one at each end of the magnet core, so that a very little battery power is necessary to "upset" it. This action combines all the good qualities of the **gravity drop** with the superior looks and neatness of the needle. We make them in all sizes from two needles to 500. Finished in any kind of wood.

No. 641.

The Iron and Wood Box Eureka Bells

Are undoubtedly the best made. Simple, perfect in Workmanship, and always **ready to ring.**

Write for quotations on "House Goods" to

WESTINGHOUSE ELECTRIC & MFG. CO.,

PITTSBURGH, PA.,

MANUFACTURERS OF APPARATUS FOR

Arc Lighting, Incandescent Lighting,

LONG DISTANCE TRANSMISSION OF POWER,

Street Railway Generators, Motors and Appliances.

Our alternating current incandescent apparatus is in use in 430 central stations. 1,000 isolated plants. Our arc apparatus is in use all over the world.

We are now transmitting light and power various distances up to 28 miles from the source.

Our multipolar railway generators and noiseless single reduction motors have worked a revolution in the electric railway field in two years.

Orders for APPARATUS, REPAIRS and SUPPLIES formerly furnished by the United States Electric Lighting Co., Newark, N. J., should now be sent to this Company, where they will receive prompt attention.

BRANCH OFFICES IN ALL THE LEADING CITIES.
AGENTS FOR CANADA: AHERN & SOPER, OTTAWA, ONT.

DON'T BUY

The transformers you will need this Fall until you have had our prices and fully considered our claims on your patronage.

The Continued Prosperity

Of Lighting Companies is threatened by attempts to completely control this business on the part of one or two great corporations.

Protect Yourselves

By supporting every legitimate manufacturing enterprise which can furnish you with good apparatus and which has the courage to be independent.

Our Transformer is the Best.

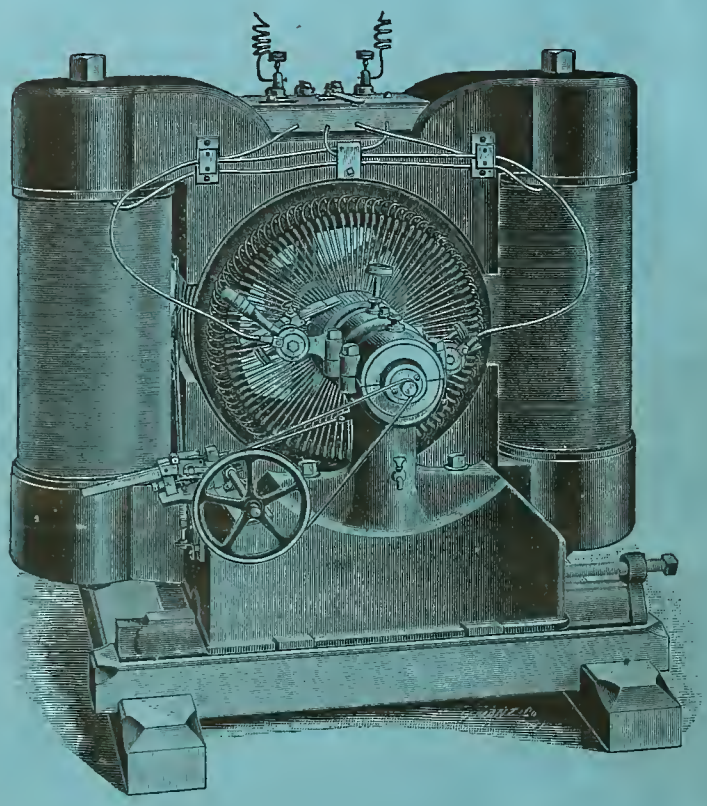
BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

"STANDARD" Single Push Button Flush SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this Switch single pole, double pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

THE WESTON STANDARD PORTABLE

DIRECT CURRENT VOLTMETERS AND AMMETERS

Are used in all parts of the civilized world. They are recognized by all authorities as the very best instruments ever produced.

During the past year Mr. Weston has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. ***The New Model*** is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the ***acme*** of perfection, and is destined to become and remain

THE STANDARD PORTABLE INSTRUMENT OF THE WORLD.

We have perfected a larger model of these instruments expressly adapted for use as ***absolute standards*** in stations and laboratories. They are designated as the

Weston Laboratory Standard Voltmeters AND Ammeters.

The scales are about three times the length of the ordinary portable standards, and the instruments are sufficiently sensitive to work to within 1-75 of one per cent. We confidently recommend them as the most convenient and accurate standards known. They are adapted for the most exact work, and will be found thoroughly equal to its requirements.

We make twenty-two ranges of

The Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants. ***We make multipliers for use with these instruments*** to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-Board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

In three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features. They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy voltmeters.*** They are specially designed for switch-board use. We are also making a large line of high grade

Station Ammeters

In ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable, well made and moderate in price.

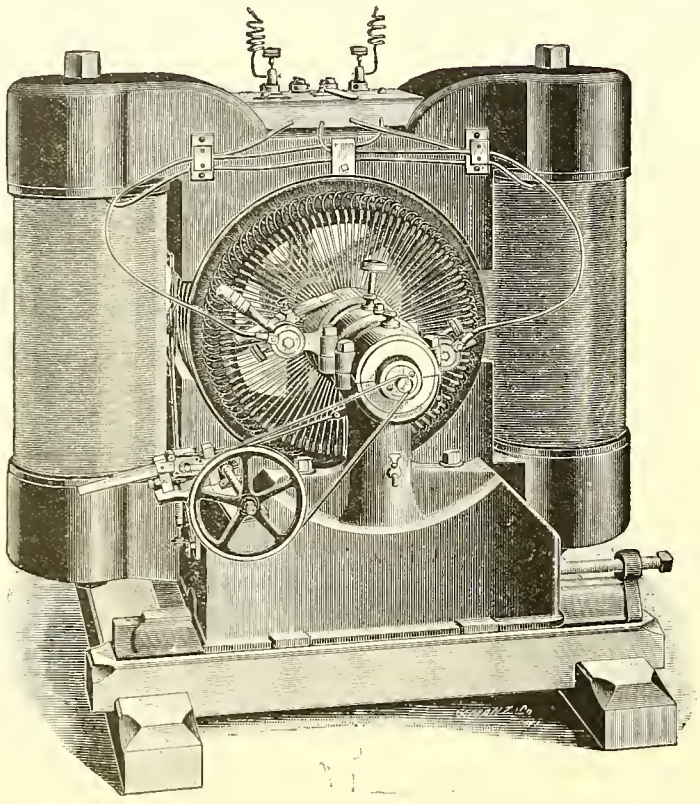
FOR FURTHER INFORMATION



ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

WHO HANDLES THE GREAT SAMSON BATTERY?

We herewith present some of the leading houses successfully engaged in the work, prominent among which are:—

Messrs. Pettingell, Andrews & Co., and Gillis & Gleason, of Boston; W. Henry Hutchinson, Lynn; Belcher & Loomis, Providence; John M. Fox, Portland; Way & Co., Hartford; Western Electric Co., Stanley & Patterson, A. L. Bogart, W. R. Ostrander & Co., and Alexander, Barney & Chapin, of New York City; E. G. Bernard, Troy; Rudolph Schmidt & Co., Rochester; Buffalo Electric Co., F. P. Jones & Co., and the Jaynes Electric Co., of Buffalo; C. H. & H. Stanton, and the G. W. Pierce Co., Philadelphia; Southern Electric Co., and the Eastern Electric Co., Baltimore; Royce & Marean, Washington; Gaines & Glover, Richmond, Va.; Standard Electrical Works, Cincinnati, Ohio; Electric Supply & Mfg. Co., and Fletcher & Fletcher Electric Co., Cleveland; Chas. E. Lee, of Chicago; G. L. Batchelder, Bloomington, Ill.; J. W. Mason, Kansas City, Mo.; A. J. Anderson, Fort Worth, Texas; John M. Klein & Co., California Electric Supply and Const. Co., The California Electrical Works, and the McWhirter Electric Co., of San Francisco, Cal.; Cosby Electric and Supply Works, Los Angeles, Cal.; Portland Electric Works, Portland, Oregon; and the Northwest Fixture and Electric Co., of Seattle, Washington.

CONTRACTORS and FITTERS use the SAMSON BATTERY because it is the BEST and CHEAPEST open-circuit cell made. ASK FOR THE **"SAMSON"** AND ACCEPT NO OTHER.

Respectfully,

THE ELECTRIC GAS LIGHTING CO.,
195 Devonshire Street, BOSTON, MASS.

BOSTON, MAY 1, 1893.

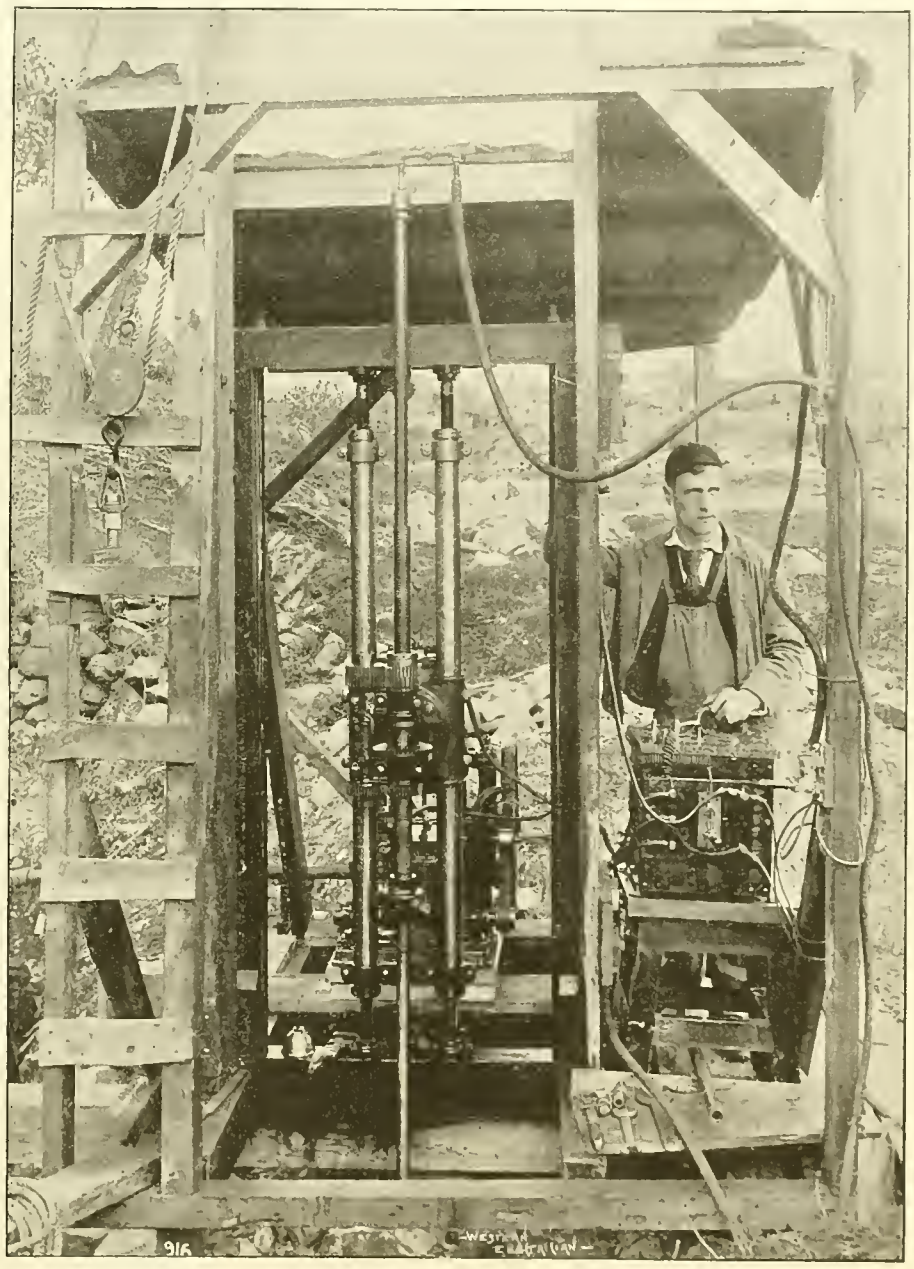
EVERY SATURDAY.

Vol. XII. CHICAGO, APRIL 29, 1893. No. 17

Electricity at the World's Fair.

As the time approaches for the formal opening of the World's Fair, which is required by law to be made on next Monday, the array of engines and dynamos in the electrical service plant in machinery hall is becoming bewildering. In the arc lighting section the 16 Brush 60 light machines, driven by five Ball & Wood engines, have been installed for some time and have taken care of the temporary arc lighting since the old temporary station south of the transportation building was abandoned. The twenty Standard arc dynamos are now in permanent position, compactly installed in two long lines of ten each, and a portion of the nightly load now carried is thrown on these machines. The Thomson-Houston and Western Electric arc machines are now in the building, and will be ready for operation in a few days. C. & C. and Mather generators are providing current for the power circuits, and the Eddy machines will soon be running. The big Westinghouse plant is well along, and work is proceeding rapidly on the Allis 2,000 horse power quadruple expansion engine that is to drive two of the 10,000 light alternators, belted in tandem. It is this engine and these dynamos that are to be started at an electric signal from the president on Monday. The other big engines of the incandescent section are being put together rapidly, and the work on the directly connected sets is proceeding satisfactorily. The great Westinghouse switch board is nearly completed and several of the other switch boards are in place. There has been some delay on the Edison directly connected 1,000 horse power engine and multipolar dynamos for incandescent lighting in electricity building, and also on the Siemens & Halske lighting set in the German space, due principally, it is claimed, to trouble in getting machinery after it had arrived in carload lots on the grounds. The Fort Wayne and Excelsior arc machines will be running in a week or ten days. The Thomson-Houston and Brush dynamos are painted white and it is said that all the machines will ultimately be of this color. On the whole, the plant is well advanced. It will take care of all demands made upon it from the first day.



ELECTRICITY AT THE WORLD'S FAIR.

The five coronas have been successfully hoisted in place in the great dome of the manufactures building. The center one, which is the largest, having a diameter of 75 feet, was built around the clock tower in the center of the building and then hoisted to the position it now occupies, where it is suspended from the trusses by steel ropes. It will sustain 102 arc lamps, and each of the four other coronas will support 78, making 414 in all. Only a portion of the lamps have thus far been wired, but those on three coronas—two at the north and one at the south end—have already been burned, permitting the workmen in the building to work at night. About 150 lamps contributed to the illumination, but the trial was entirely satisfactory, and demonstrated that the big electroliers will be a pronounced success.

Electric mining and pumping machinery will form a conspicuous portion of the General Electric company's exhibit in electricity building. The illustration on this page shows a new diamond prospecting drill, operated by electricity, that will undoubtedly attract considerable attention. The vertical drilling head is driven by an electric motor, to which it is connected by suitable gearing. The drill is fitted with a hydraulic feed, the drilling head being mounted on plunger rods working in pistons, and the arrangement is such that water, under pressure, may be admitted above or below the piston. The motor used is of the two-pole type, controlled by a resistance box, shown at the right in the illustration. The length of the plungers gives a feed of 18 inches before it is necessary to reset the drill rod.

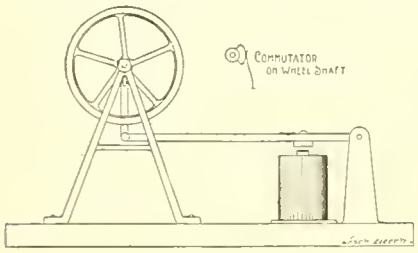
Of the foreign nations exhibiting in the electricity building Germany will undoubtedly make the most extensive display, with France a good second. A number of the German gallery exhibitors were enumerated in the WESTERN ELECTRICIAN last week. To them should be added the Imperial Telegraph department, which will make an elaborate display. On the ground floor, directly under the gallery space are located the firms making heavier exhibits. They are Siemens & Halske, Berlin; Schuckert & Co., Nuremberg; Charles Pollak, Frankfort; Felten & Guilleaume, Muelheim-on-the-Rhine; Allgemeine Elektricitaets Gesellschaft, Berlin; Hartmann & Braun, Frankfort; H. Schomburg & Sons, Berlin.

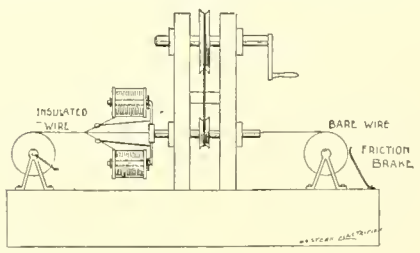
Schuckert & Co., who are represented by Fred W. Tischendoerfer, have 600 square feet of space. The special feature of this firm's exhibit will be immense searchlights. Four of these, Mr. Tischendoerfer says, will be mounted at the four corners of the promenade surmounting the manufactures building. The one on the northwest corner is said to be the largest in the world, being five feet in diameter. Two of the others are four feet in diameter, and one three feet. Three of the big lamps will take 150 amperes of current each, while the smallest one will require 90 amperes. Two of the projectors will be fitted for operation by electric motors and two by hand. In all the carbon feeding apparatus is automatic, and each one is supplied with all improvements for marine use, including signaling devices. The firm will also show three other search-lights in its space in electricity building. Among other Schuckert exhibits will be a combined engine and dynamo for ship lighting, an electric signaling apparatus for communication between the conning tower and engine room of a man-of-war, zinc plates made by electrolysis and photographs of large central stations in Germany equipped with Schuckert apparatus. The firm will also contribute accurate sets of drawings of six of its central station plants for the German engineering exhibit in transportation building.

An attractive exhibit will be that of Felten & Guilleaume, which is in charge of G. A. Schmidt. This firm is one of

the most extensive manufacturers of electric wires and cables in the world. A large and elegant upright showcase, designed after the style of the Renaissance and constructed of expensive woods and plate glass, will be the most conspicuous feature of the display. It will be divided into eleven compartments, one of which will be devoted to the new system of air insulation adopted by this house. Cables and wires of all sorts will be shown in section, and there will also be a large exhibit of house goods. Three large pyramids—one of copper wire, another of iron wire and a third of wire rope—will be conspicuous features.

Of particular interest will be the display of the Allgemeine Elektricitaets Gesellshaft, the principal feature of which will be a scheme for the transmission of power, involving the use of the three-phase current. The first machine in the series is a 200 horse power direct current motor taking current from the 500 volt power circuits supplying electricity building. This motor will be belted to a 100 horse power three-phase multipolar generator. The latter machine, which will be sure to attract much attention, has a periodicity of 50 per second. It has 14 poles and is wound for a potential of 120 volts. It will supply current for a number of multiphase motors, distingnished by the absence of brushes and the fact that the direction of rotation can be instantly reversed. The largest of these motors is rated at 50 horse power and will be directly coupled to a continuous current dynamo; the others will drive pumps, fans and the like. The dynamo last mentioned has a capacity of 300 amperes at 120 volts. It will supply current for 336 16 candle power lamps and a number of small direct current motors ranging from 1-16 to 6 horse power, embracing eight sizes. The lamps will be used for lighting the space and for decorative effects and will also be employed in connection with an elaborate display of stage lighting regulating mechanism. All the parts of incandescent lamps as made in the various





FIGS. 1 AND 2. EDWARD WESTON AND HIS ELECTRICAL WORK.

processes of manufacture in the company's factories in Berlin will be shown, and there will also be nine Allgemeine arc lamps operated on incandescent circuits. In addition there will be a display of electric heating and cooking utensils, a street railway motor and truck, electrically controlled clocks, an electrical device for indicating the time of departure and destination of trains at railway stations, and a number of new measuring instruments. The switchboard will be in the center of the exhibit and will be horizontal instead of vertical. Taken altogether, the Allgemeine company will undoubtedly have the most varied display of any foreign exhibitor in the building. The exhibit is in charge of Jacob Stoetzner.

Hartmann & Brann will make an extensive display of instruments and specialties; Charles Pollak will have an exhibit of secondary batteries, and Schomburg & Soos will show porcelain goods. The principal exhibit of Siemens & Halske will be in the machinery hall, where the firm will have a large directly coupled engine and dynamo, from which it will supply current for lighting the railway terminal station and choral building on the five-wire system. But a pleasing display will also be made in electricity building by this house.

All the German exhibitors are well along with their work, but complain of the delay in delivering cars after their arrival at the park. The criticism of this feature of the exposition management seems to be quite general, and the lack of transportation facilities is largely to blame for whatever delay has been caused in the installation of exhibits.

The Electric Heat Alarm company of Boston will show a complete fire alarm system in the northwestern portion of the gallery of the electricity building. To show the effects of fire the company will heat the bearings of its "journal alarm" by Carpenter electric heaters.

General Manager Mason of the Railway Equipment company of Chicago announces that his company has established a directory of World's Fair visitors interested in the operation of street railways. The office of the Railway Equipment company is in the Pullman building—a convenient location for all visitors going to the park by the Illinois Central railroad.

A large proportion of the electric launches are now at the park. All the boats will make regular trips, and there will be no "cab boats," as was at one time contemplated. The launches will start from the north or main entrance of the agricultural hall. From there they will cross the lagoon to the south door of the manufactures building; thence to the bridge at the southwest corner of manufactures, to the main west entrance and northwest corner of the same building. Going north, the launch turns at the inlet near the fisheries and runs east, stopping at the fisheries bridge and the clambake. Turning and coming back to the lagoon the run takes passengers to the landing before the fine art galleries, swing around the north pond, it comes back to the Illinois building, the womans' transportation, the bridge between the electricity and mines, near the hunters' camp, then to the northeast corner of electricity, then to the southeast corner of the same building and back to the starting point. It is thought from trial trips that the round trip can be made in about 52 minutes at the prescribed rate of speed—about four miles an hour. The speed has been put so low on recommendation of Capt. Symonds, in charge of the marine fleet, because a faster rate of speed might prove dangerous and the wash from the boats might injure the landscape work along the banks. The Electric Launch & Navagation company will have about 200 employes, including 50 boat captains. The awnings and pennants of the fleet are expected to add considerable to the picturesque value of the lagoons in the general landscape effects. The launches will have awnings of orange and red stripes, will fly the regulation United States navy ensign at the stern and the Columbian maritime flag at the bow. The latter, designed by Mr. Millett, has a white ground with an anchor of yellow surrounded by a wreath of the same color.

A party of students from the electrical engineering department of the University of Wisconsin spent a week lately in inspecting electrical plants in and about Chicago under the direction of Prof. Jackson. Six hours were given to the World's Fair, and the embryo engineers gave especial attention to the machinery and electricity buildings. Engines and dynamos of all designs, the giant Allis quadruple expansion engine and the big Westinghouse and Siemens & Halske generators, the electric subways and the exhibits in the transportation building were all briefly looked over.

The Rockford Electric Manufacturing company has shipped its World's Fair exhibit. It consists of a 25 horse power iron-clad motor to be belted direct to a Scott perfecting printing press. This interesting combination will be located in machinery hall, and will be used to print the official daily newspaper. The Rockford Electric Manufacturing company will also have a 40 horse power iron-clad motor in the electricity building in connection with the Standard Electric company's exhibit.

World's Electrical Congress.

A communication has been addressed to Prof. Elisha Gray, chairman of the World's Electrical Congress, by the following representatives of the electrical interests of Chicago: Brush Electric company, S. A. Douglas, district manager; South Side Electric company, W. H. Harding, manager; Western Electric company, C. D. Crandall, manager; Great Western Manufacturing company, H. K. Gilman, business manager; Standard Electric company, D. P. Perry, manager; General Electric company, B. E. Sunny, Western manager; Chicago Arc Light & Power company, C. H. Wilmerding, president; city of Chicago, electrical department, John P. Barrett, superintendent; Chicago Edison company, Samuel Insull, president. The communication, which is dated April 17th, is as follows:

A great deal of confusion is still caused by the term 2,000 candle power, 1,200 candle power, etc., in referring to arc lights. In a good many instances this commercial term has been the cause of litigation between electric light contractors and purchasers of arc light apparatus. We beg to refer in this connection to a few paragraphs taken from Prof. Elihu Thomson's paper read before the National Electric Light association, Providence, R. I., February, 1891.

"It is well known that the value of an arc light for general illumination is greatly enhanced by the fact of the distribution of light being mainly in a downward direction in continuous current arcs. This, of course, follows from the fact of the positive carbon crater being above, such crater being the part from which most of the light comes.

"This matter has been quite thoroughly investigated and

FIG. 6.—EDWARD WESTON AND HIS ELECTRICAL WORK.

many diagrams of distribution are to be found in the literature of the subject, as published from time to time. They show that with the long arc the maximum intensity of light is from 40 degrees to 60 degrees downward from the horizontal and that the horizontal intensity is generally much less than one-half as great, while, of course, the intensity diminishes above the horizontal direction and ultimately becomes zero before reaching the upward vertical direction. In like manner the approach to the downward vertical from the direction of maximum intensity is attended with similar rapid diminution.

"The spherical candle power of arc lights would therefore be only a fraction of the rated candle power which is generally taken at the maximum light obtainable in the best direction from the particular arc or kind of arc in question.

"For this reason the term 2,000 candle power arc has little significance as indicating the illuminating power of an arc. It is now generally taken to mean an arc with ten amperes and not less than 45 volts potential difference between the carbons, or a 450 watt arc. The quality of the carbons will determine whether the 450 watts will be expended in obtaining the most light or not or whether that light will have a maximum intensity at one angle or another within certain limits."

As a matter or fact, all attempts made by purchasers of electric arc apparatus to measure what they usually term the actual candle power of arc lamps have been dismal failures, as there are only a few of the best fitted laboratories in this country in possession of instruments by which they can determine the mean spherical candle power of an arc.

In this connection we would draw attention to an article

FIG. 7. EDWARD WESTON AND HIS ELECTRICAL WORK.

of M. Blondel, which appeared in *L'Industrie Electrique*, an abstract of which was published in the WESTERN ELECTRICIAN, April 15, 1893, from which it is evident that it is absolutely necessary to define the general commercial terms, 2 000 candle power, 1,200 candle power, etc., in practical electrical units.

It is for the reasons stated above that the undersigned ask you to kindly take this question up at the coming Electrical Congress during the World's Columbian Exposition and have the commercial terms mentioned above defined as follows:

"The term 2,000 candle power arc to mean an arc pro-

duced by 10 amperes and 45 volts potential difference between the carbons, or a 450 watt arc. The candle power of arcs produced by currents of more or less amperes or more or fewer volts difference of potential, to be rated proportionally."

Such a definition would at once call a halt to all disputes on this question and would enable every station superintendent, by simply employing a standard ampere meter and a standard voltmeter, to determine whether or not the electric contractor had fulfilled the conditions of his contract as to candle power.

Edward Weston and His Electrical Work.

A story that tells of the efforts of the pioneer in any line of work, whether he be successful, as the world puts it, or, in a sense, a failure, is usually an interesting bit of reading. Men are the same to-day in many respects as they were long ago, and, like the old Romans, they still enjoy hearing of a contest, whether it be a physical or an intellectual one. The early efforts and sacrifices in gaining a part of commercial men to forget that the pioneer cherishes the hope that the child of his brain, if allowed to live at all, shall at least bear his name. Money is a great destroyer of such sentimental distinctions and to-day it is a common thing to see the product of one man's brain paraded under another's name. But happily there still remain a few gifted workers who, through their continuance of valuable original work, compel commerce to make obeisance. Among this class, it is almost needless to say, the name of Edward Weston stands pre-eminent. Only those who know Mr. Weston, or have heard the story of his life in detail, can fully appreciate the patient and valuable investigation along electrical lines that has been carried on under his guidance. To be sure, the factory of the Weston Electrical Instrument company and Mr. Weston's laboratory in Newark, N. J., are monuments to his ability and industry. But even these establishments, representing as they do years of painstaking

FIG. 5. EDWARD WESTON AND HIS ELECTRICAL WORK—VIEWS OF FACTORY.

start, or the struggles of men, who, like Columbus, set sail over unknown seas to discover they know not what, are subjects of interest that catch and hold the attention of thinking men. While it is true that much is learned through failure, it is really the record of the early struggles of the successful pioneer that is of paramount interest to those who take up the broken ends of the chains of investigation that they too may contribute a few links. Electrical men especially appreciate this fact. The difficulties encountered by those patient toilers who with but little to guide and encourage them have cleared the way through a field remarkable for the mystery that surrounded it possess a peculiar interest for the electrical engineer. In this time of consolidations and combinations early electrical work—even the most successful work—is apt to be forgotten. The watchword in this country now seems to be "Advance and forget the Past except where it can be made useful in furthering the commercial interests of the Present." And in pursuing this policy who among the truly scientific workers in the electrical field does not witness with regret the willingness on the brain work and patient investigation, can not be fully appreciated without an intimate knowledge of his work, extending over a period of fully 35 years. Recently a representative of the WESTERN ELECTRICIAN had the pleasure of visiting Mr. Weston, examining his rare collection of books, models and valuable apparatus at his laboratory and library, inspecting his factory and, what was more interesting, listening to the story of the early struggles and trials, as well as the subsequent success and scientific achievements which have crowned the efforts of this remarkable man.

The distinguished inventor and electrical investigator was born May 9, 1850, at Brinn Castle, near Oswestry, in the country of Shropshire, England. His parents were moderately well to-do and owned a farm. His father, however, was skilled in the use of tools and was distinguished throughout the neighborhood as a mechanical genius. Living as he did in a manufacturing town, the boy was brought in contact with men of mechanical tastes and he moved in an atmosphere that tended to develop his inclinations. It was at an early period that he first manifested an interest in all kinds of machinery, and like most boys he soon began the construction of models of steam engines and other machines. His interest, though, in electrical machinery was first awakened in a peculiar manner, which is described by Mr. Weston in an interesting anecdote: "I was between seven and eight years old," said he, "when I was sent one morning on an errand to a drug store. On entering the apothecary shop I noticed on the counter what was to me a very peculiar and mysterious looking box. With natural boyish curiosity, I was immediately attracted and began to investigate. Raising the lid I found within a bar of steel, U-shaped and painted red. At the end of this piece of metal there were pivoted two peculiar looking bobbins. A crank on the outside of the box was connected with these bobbins in such a manner that they could be revolved in front of the U-shaped piece. There were the loose metal cylinders, too, attached to the usual spirals of insulated wire. Of course you recognize the machine, but to me it was a mystery and strongly attracted my boyish fancy. The druggist noticed my childish curiosity, and much amused, gave me the handles to hold. It is needless to say I was willing to do anything to become more intimately acquainted with the curious bit of mechanism so I grasped the metal cylinders with a vim. The crank was turned and I received a shock that I shall never forget. It was the first time—but I can assure you it was not the last—that I had ever received an electric shock, and you may readily imagine the impression made was a lasting one. This, my first experience with electricty, instead of setting my curiosity at rest, aroused it to the highest pitch, and from that day to this the development of the latent possibilities of the electric current have had an irresistible attraction for me."

From that time on electricity became the young amateur's hobby. At the age of nine years he began his reading. Smee's "Elements of Electro-metallurgy" was one of his first books, and not only reading but experimental work along electrical and chemical lines was his favorite employment in leisure hours. Of course he had

a workshop in his parents' house and as a natural consequence his family, like most families that embrace mechanical geniuses, was in constant fear of an explosion or some other equally dreadful accident.

Electro-metallurgical experiments were at first the favorite pursuit, but the young investigator soon drifted into work along other lines. The general design of his first electric motor, built at this early age, is shown in the accompanying illustration, Fig. 1. Mr. Weston seemed to enjoy telling of the manner in which he overcame the numerous difficulties which he encountered in constructing this little motor. "My greatest trouble," said Mr. Weston, "was in obtaining suitable insulated wire. Although the town in which I lived was one of 150,000 inhabitants, there was not one electrical supply store in the place. I was therefore driven to the necessity of insulating my own wire. Of conrse bare copper wire was easily obtainable, but wire with insulation on it was another thing. Perhaps you'll be interested in the construction of this little covering machine, so I will sketch it for you." Suiting the action to the word, Mr. Weston made the little sketch presented herewith in Fig. 2, which is self-explanatory. Continuing

FIG. 4. EDWARD WESTON AND HIS ELECTRICAL WORK.

he said: "It would appear at first sight to anyone not familiar with snch winding machines, that with this little device I conld have done fairly good wor'k with but little trouble. You have no idea, though, how expert I had to become in the manipulation of the two handles to produce wire that was really insulated. You see, unless I moved both handles at certain fixed speeds I left gaps between the convolutions of the cotton. You will, perhaps, be amused when I tell you how I overcame this difficulty. By the use of brown cotton on one spool and white on the other, the instant my windings became irregular I detected the change and could adjust the speed to suit."

Just at this time there was an occurrence which may be taken as illustrative of one of the characteristics of the man as a patient investigator. He was desirous of making a primary battery that would produce results radically

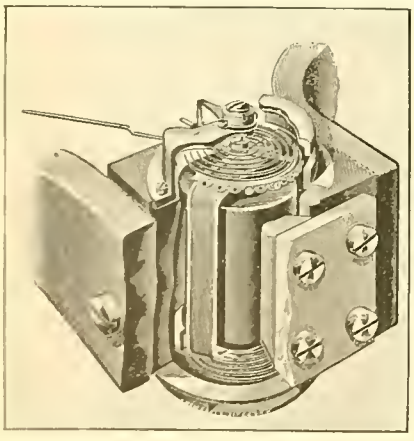


FIG. 5. EDWARD WESTON AND HIS ELECTRICAL WORK.

different from the ordinary form then obtainable. His ambition was to make a Grove or Bunsen cell. The platinum element was of course out of the question. He had therefore to resort to carbon as a positive element, but where to obtain carbon in the form necessary for use in such a battery perplexed him greatly. Nothing daunted, however, he boldly essayed to cut a carbon plate from the rough and tough blocks of carbon which he had obtained from a neighboring gas-works. He first tried to saw his plates from the block, but the hardness of the material prevented the successful accomplishment of this task. Not to be thwarted, however, he actually set to work to chip out from the obdurate material pieces of the required shape and size. After days of patient and persistent toil he at last produced a suitable plate for his battery.

Success in this direction led him to begin the manufacture of electric bells and similar apparatus, and while still a boy he erected a small telegraph line in which the insulators consisted of the necks of glass vials through which the wire was passed.

It was at this time that Mr. Weston became deeply interesting in solving the problem of steam propulsion on common roads. It is interesting to note that even at this early day he suggested the use of rubber tires for avoiding the cutting up of the roads. Experiments, however, along this line were too expensive to permit of his undertaking them.

At 16 years of age, Mr. Weston had accumulated quite a variety of electrical and philosophical apparatus, and it was then that he gave his first public lecture.

The question of a profession for the boy had now become a serious matter with his parents. The youth's tastes naturally tended towards mechanical engineering. Dental surgery was first suggested, and under the guidance of a prominent dentist work along this line was begun, but it was soon discovered that young Weston very much disliked the business, his tastes lying in quite another direction. The parents then decided that he should abandon the career of a dentist and begin the study of medicine. Under the guidance of old Doctor Coleman, a distinguished and kind-hearted physician of the town, Mr. Weston pursued studies more to his liking. Dr. Coleman was a man not only deeply interested in medical science, but in the kindred sciences. Young Weston, as was the custom with medical students at that period, went to live in his preceptor's household. Dr. Coleman had collected quite a large variety of philosophical apparatus, and in his study and under his kindly, yet painstaking and careful guidance, young Weston, in his leisure moments, pursued most enthusiastically, the study of electricity. So much interest did the young student display in what in those days was called "tomfoolery" and of little practical use, that it seemed to his parents that he had not as yet found the calling for which he was best suited. The apparent want of stability on young Weston's part led to considerable trouble with his parents. They, believing in their conservative way, that the boy lacked the faculty of application, pressed him to continue his medical studies. They thought that he had here an opportunity and should stick to it. Matters continued in this way until the young practitioner had an experience that literally scared him into an abandonment of the much disliked profession.

He was called one day to prescribe for a case that was in reality one of typhoid fever, with rheumatic symptoms. With the usual confidence of the young physician, he comp'acently diagnosed the case and prescribed treatment for the rheumatism alone. The typhoid symptoms had not appeared, or at least were not recognized by him and it never occurred to him to look for them. It was needless to say that he had left his patient but a short time, when he was hastily called again by those in charge

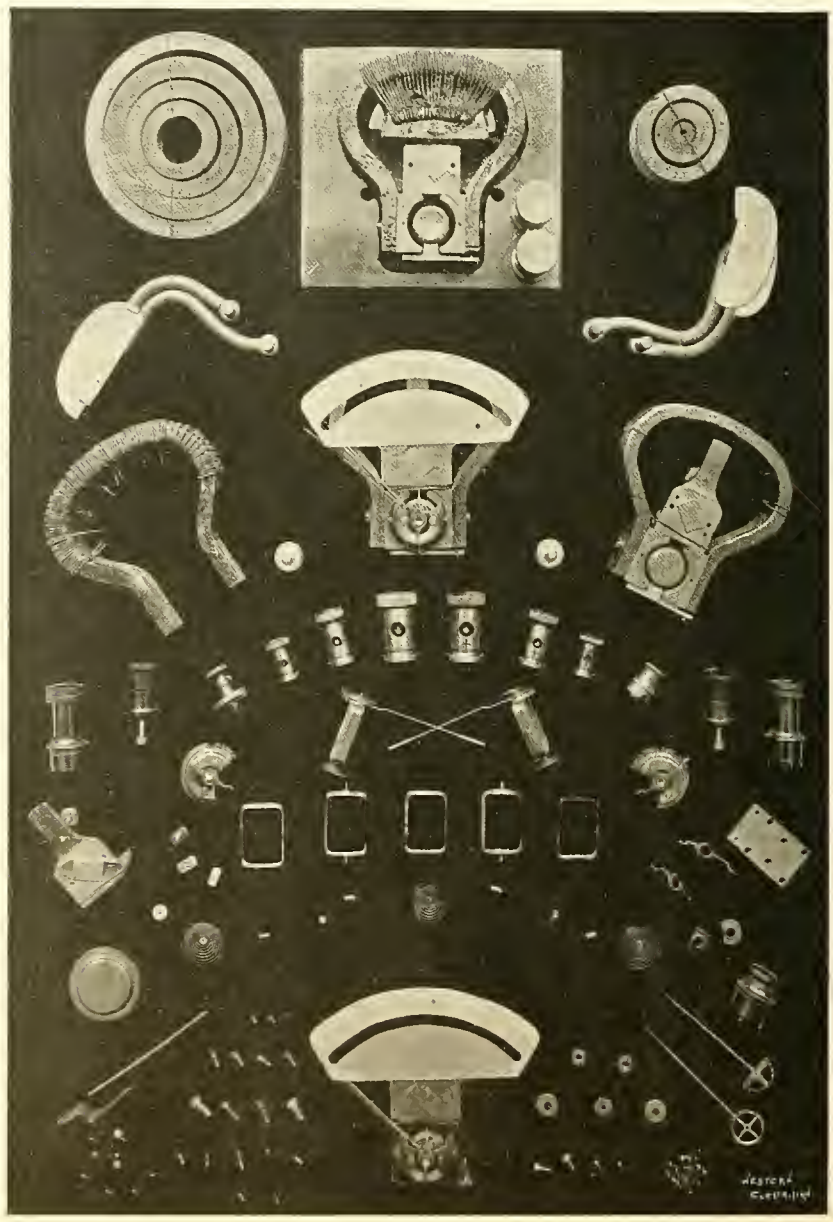

FIG. 8. EDWARD WESTON AND HIS ELECTRICAL WORK.

of the patient, to attend the dying woman. This was too much for young Weston, and, literally scared almost out of his wits, he called to his aid another physician, with whom he was at that time associated, and through their united efforts the patient was finally pulled through.

This was the culminating point in Dr. Weston's medical career. It made him also a little indifferent to the wishes of his parents, and he concluded that he would be less hampered if he struck out for himself. His first thought was to go to London; his second, and the one upon which he acted, was to leave England entirely and visit America. It was some time in the month of May, 1870, that he started for the United States. He arrived in New York with comparatively little money, a few books, and some favorite pieces of apparatus. Armed with a few letters of recommendation from friends at home, he visited

some of the institutions of learning in and around New York. Among others he called upon Prof. Chandler of Columbia College. Prof. Chandler treated him with great consideration and although he procured letters to a number of concerns in New York, the only advice tendered was that he would probably do better in the old country than in the new.

It was through Prof. Chandler's letters, however, that Mr. Weston finally managed to secure a situation as a chemist with a manufacturer of photographic chemicals.

It is somewhat singular that Mr. Weston's course in life was in two cases at least directed by accidents to electrical work. The first of these occurrences has already been recorded; the second was an explosion of chemicals that nearly cost him his life. While with the chemical manufacturer in the basement of a four-story house at 417 Broome street he was engaged in the manufacture of gun-cotton. Through carelessness on the part of a visitor to the establishment, a half-burot match was tossed into a tray of the explosive. Never had the chemist had on hand such a large stock of gun-cotton. Young Weston, luckily uninjured by the first explosion caused by the dropping match, put out the flames before they reached the other trays of gun-cotton. He made up his mind he had seen enough of life as a gun-cotton manufacturer and retired from that position.

He next appeared as chemist and electrician to the American Nickel Plating company, also of New York. While with this concern he devised many important processes that are now commonly used in nickel plating, and it is firmly believed by those of Mr. Weston's friends who are aware of his work in this direction that had he patented all his inventions in the art of nickel-plating he would at this day be the recipient of a princely income from this one source alone.

It was in 1872 that he began the study of the construction of dynamo-electric machines. He entered upon this work primarily with the view of applying the dynamo in electro-metallurgical work. In December of this year he engaged in the nickel-plating business on his own account, and continued in it until 1875. In 1873 he prepared the first copper-coated carbons. It was in this year, too, that he invented his well known dynamo armature; his simple shunt-wound dynamo, designed for constant electromotive force, was under construction at this time. The design of his machine alone, as is now well known by electrical men in general, is such that had he done no other work his name would still live among the designers of the best and most efficient types of dynamos of the day. The close self-regulation of this machine was most remarkable, and was illustrative of the value of careful and scientific construction.

It was in 1875 that Mr. Weston took out his first patent. It was for an improvement in a nickel-plating process, but in this year he gave up the business of nickel-plating and moved to Newark, N. J. Here he formed a copartnership with Messrs. Stevens, Roberts and Havell of Newark for the manufacture of dynamos for electro-plating, electrotyping, electric lighting, and other purposes. It is generally conceded that Mr. Weston was the first man who succeeded in producing a dynamo that would serve satisfactorily for electro-metallurgical work. He employed an ingenious automatic cut-out which prevented a reversal of polarity and consequent change in the direction of current, thus overcoming one of the most serious defects in the machine.

The business grew so rapidly that on July 10, 1877, the Weston Dynamo Machine company was formed to carry on the business with a capital of $200,000. This company, the first of its kind organized in this country, did splendid work in introducing dynamos to do the work that had formerly been performed in electrotyping and plating establishments by batteries. It is interesting to call attention to the fact that now scarcely any electrotyping or plating establishment of any magnitude is run without its own dynamo. In some cases, however, a battery is still used more satisfactorily. Where it is desired to give poor, copper colored gold a richer appearance by coating it with rich yellow gold, a battery is still employed. The reader will have a fuller appreciation of the value of Mr. Weston's improvements in this particular work when it is understood that patents covering certain nickel-plating processes were sold by Mr. Weston for $50,000 to the Weston Malleable Nickel company.

Another interesting fact in connection with the business of the Weston Dynamo Machine company's factory was that even at that early stage of the industry the number of the dynamos turned out frequently reached four per day. The machines were shipped all over the world; in fact it was often remarked that it was somewhat singular that at such an early date a demand should have arisen for such apparatus in countries so remote.

It was about 1875 that Mr. Weston began to deal with the problems relating to the production of light and transmission of power by electricity. A year later he constructed quite a number of incandescent lamps having many features of novelty and great value. Those particularly desirous of learning something of Mr. Weston's work along this line will find a great deal of valuable matter in his discussion of Calvert Townley's paper before the recent St. Louis convention of the National Electric Light association on "The Incandescent Lamp from a Commercial Standpoint." Mr. Weston's address on this occasion was published in the WESTERN ELECTRICIAN of March 18th. One of the most important processes devised in this connection was that of the so called hydrocarbon treatment. Mr. Weston states as a curious fact, that while Mr. Maxim obtained the credit for this invention, and Mr. Sawyer obtained the patent, he was the one who made the invention, and it was, only after a long contest in the Patent Office that he succeeded in establishing his rights. In connection with the arc lamp Mr. Weston devoted a great deal of time to solving the problem of running lamps in series, and it is a question as to whether Mr. Weston was not the first investigator to accomplish this result. To be sure the

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

FEW men have attained the distinction in the electrical field that has been gained by Edward Weston, whose life and work in the interest of electrical science forms the subject of an interesting and instructive article presented in this issue. Mr. Weston has been an intelligent, patient and persistent investigator and the fame and fortune with which his labor has been rewarded are well deserved. A gentleman of culture and refinement, he wears his honors with becoming modesty. His success is a matter of personal gratification to the entire electrical fraternity.

WE notice in London *Industries* of April 14th an appreciative article on the World's Columbian Exposition. The description, although brief, is fair in spirit, contrasting favorably in this respect with a portion of the foreign press and, unfortunately, a small number of American newspapers. It is accompanied by a double-page supplement giving pictures of the buildings. The cuts are fairly accurate and are only rendered misleading by the fact that the representation of the agricultural building is given as the transportation building, and *vice versa*. Aside from this error, the article is entitled to commendation.

DURING the World's Fair the Chicago Electric club will be called upon to entertain many distinguished visitors attracted to the city by the Exposition and the Electrical Congress. Chicago has a well-earned reputation for hospitality among the electrical people of this country, but never before has the electrical fraternity of the city been confronted with such an undertaking as that presented at the present time. There will be many foreign visitors and to the entertainment of these especially must the club attend, as the organization will be obliged in this instance not only to represent the city but the country. It is certainly fortunate that Chicago has a well-established electrical organization with headquarters suitably arranged for the entertainment of members and guests, and conveniently located in the business center of the city. But clubrooms and furnishings, while very desirable are not the only essential features. Individual effort on the part of every member of the organization will be required and the new management has a right at the present time to expect assistance from every person connected with the electrical interests of the city. The newly elected officers upon whom will fall much of the responsibility of this work are well equipped for their task, all are widely known in the electrical field and they have been prominently identified with the organization. They will receive the support of the retiring officers who will gladly give them whatever assistance experience may afford. This will certainly be a most important year for the electrical interests of Chicago and it ought to be a great year for the Chicago Electric club.

THE communication addressed to Prof. Elisha Gray, as chairman of the World's Electrical Congress committee, by a number of representative Chicago electrical business men, asking that action be taken by the congress to give a more accurate name to the arc lamp now usually spoken of as of "two thousand nominal candle power," is worthy of serious attention. The proposal that the illumioating power of the lamp be designated by the number of watts passing through it certainly points the way to an improvement on the meaningless term now in use; but why can not we have a unit of illuminating strength applicable to both arc and incandescent lighting and capable of easy measurement, without an elaborate series of laboratory demonstrations? Of course incandescent lamps could be compared by the electrical energy consumed, and we might speak of 50 or 55 watt lamps. Then instead of the terms "2,000 candle power arc" and "16 candle power incandescent" we would refer to "450 watt arc" and "50 watt incandescent." But although the latter method would represent with approximate accuracy the relative drafts made on the coal-pile for each lamp, it would not indicate the comparative illuminating power of the lamp, under consideration. In other words it would not be contended that the arc lamp gave no more light than nine of the incandescent lamps, as anyone not well acquainted with the operation of the two systems might infer. It may be urged that the two methods of producing electric light are adapted to divergent uses, and that a common standard of measurement is not necessary. But the two are now used often in conjunction and consumers frequently buy both from the same central station, so that a uniform unit is desirable. What is wanted, then, is an accurate standard of illumination, applicable to arc and incandescent lighting, and capable of commercial measurement.

ADVOCATES of municipal lighting plants and other misguided and misinformed individuals who would invest municipalities with powers that rightfully belong to private corporations should reflect upon the statement of Mayor Gilroy of New York, who, in a recent interview upon a project of this kind, said: "I believe in encouraging private capital. New York city should not enter the field as a competitor in matters that are the legitimate objects of private enterprise. The moment it does it paralyzes private enterprise, it drives out private capital, and makes it seek other cities and other countries for investment." Another reason why such powers should not be given to cities is found in an editorial recently published in the *Chicago Tribune*, which, by the way, has constantly advocated the establishment of city lighting plants to compete with local companies: "As a general rule the operating expenses of an industry run by a municipality are much higher than when a corporation of private individual has the management. Wages paid by a city are higher and more people employed than is necessary. The small economies are never thought of, but they constitute the profits in most businesses. Almost invariably, too, customers are better served by a private company than by a municipality and give it the preference." In this connection the views of C. H. Wilmerding upon the Thiele lighting bill, presented in another column are interesting and instructive. Should the adoption of the Thiele bill by the Illinois Senate be followed up at once by the endorsement of the lower house, there is little hope that Governor Altgeld will veto the measure unless his views on such matters have undergone radical change. In the meantime the representatives of the electric lighting companies throughout the state should oppose its adoption although there is little hope of success. This measure is thoroughly bad in principle; it is antagonistic to legitimate enterprise, and will have a tendency to frighten capitalists who would otherwise invest in electrical work. The bill should be defeated.

JUDGE HALLETT'S decision in the case of the Edison Electric Light company against the Columbia Incandescent Lamp company at St. Louis, last week, was the most important ruling in the lamp litigation since the final decree of Judges Lacombe and Shipman was handed down in the Sawyer-Man case in New York, October 4, 1892. By the terms of that decision, it will be remembered, the Edison incandescent lamp patent was sustained, and the companies making similar lamps, "consisting essentially of a filamentary carbon burner, hermetically sealed in a glass vacuum chamber," were declared infringers. The litigation leading up to and resulting in this decision had been long and costly, and it was at that time generally believed that the incandescent lamp business of the country would be controlled, for a time at least, by the owners of the Edison lamp patent, the General Electric company. That company undoubtedly believed such to be the case, and it was not wholly unwarranted in this assumption, for in following up the case the decision of the Court of Appeals was taken as a precedent in other circuits, and lamp factories in many parts of the country were closed. Very little serious opposition was encountered until the Beacon case came up for a hearing before Judge Colt in Boston. The defendants in this action opposed the granting of the injunction and it was here for the first time that the claims of Henry Goebel were presented. This defense, however, was only partially successful. It delayed for a time the granting of the injunction, but did not prevent Judge Colt from finally issuing the restraining order. It was generally believed that the Goebel claims would be abandoned after the failure of the Beacon defense, but when the trial of the Columbia company's case was reached, it was found that these claims were again to be presented and this time in a much more complete form. The defense had learned through experience in the Beacon case in what particular points the Goebel claims were deficient and it proceeded to fortify itself in these places. So successful was the Columbia company that it secured a substantial victory on Friday, April 21st, when Judge Hallett decided not to grant the injunction asked for by the Edison company. This decision was the first serious set-back the General Electric company had received in its lamp litigation and was least expected at this time owing to the fact that it had already succeeded in defeating the Goebel claims in the Beacon company's case. Judge Hallett evidently anticipated that his decision would be received with some surprise and he looked upon as a departure from the course pursued by judges of other circuits, for he took particular pains in the opinion accompanying his decision to justify his course in this particular. Begining with the Sawyer-Man litigation he says:

It is also contended that the decree of the Circuit Court of New York against the United States Electric Lighting company sustaining the patent, which decree has been affirmed by the Court of Appeals of the Second Circut, is conclusive of complainants' right to the writ for which they now ask. No doubt is entertained as to the conclusive effect of that decree here and elsewhere, as to all matters in issue in that cause. For although respondent was not a party to that litigation, the court would not, on a preliminary motion, consider any matter which passed to judgment in that suit. But the Goebel defense was not made in that suit, and therefore the case was not the authority on this motion which has been ascribed to do it.

Concerning the bearing of the Beacon case in which the Goebel defense was made, the court ruled that there was material difference in the actions:

It is contended that the ruling in that case should be recognized and followed as a precedent in respect to the present motion. And perhaps, if the issue, the testimony and the situation of the parties, appeared to be the same in both cases, such result might follow more from the persuasive effect of the opinion of another court on the same matter than from any notion of authority ascribed to such opinion. In this instance the consequences to flow from diverse opinions are not regarded as serious. In the Massachusetts circuit, and here as well, the motion is interlocutory, and in each case the ruling may well enough stand upon the situation of the parties. And we have much additional testimony to that upon which the court acted in the Beacon case; so that upon all points I do not feel compelled to accept the opinion of the court in that case.

A new factor is introduced in the litigation by this decision of Judge Hallett. It will be necessary for the General Electric company to disprove the statements made in the Goebel case, to prove conclusively that the Goebel lamp was not practicable, and, in fact, to establish once more Mr. Edison's right to the patent upon the incandescent lamp.

Edward Weston and His Electrical Work.

(*Continued from page* 217.)

Jablochkoff candle was run in series, but this device was strictly speaking, not to be considered as an electric lamp. Mr. Weston did excellent work also in the direction of the application of electricity to power transmission. Practical work was done by him as far back as 1876. In 1878 he constructed several electric motors and used them for the purpose of propelling electro-torpedo boats. In fact, even before 1878, he employed motors of one, two and three horse power to do daily service in his factory. An invention of Mr. Weston, which, owing to unfortunate and peculiar circumstances, has not been applied to the extent that it should have been, is one that relates to the preparation of a material called "tamidine." While speaking of this substance Mr. Weston grew enthusiastic. "Tamidine," he said, "I firmly believe is the best substance that has ever been produced from which incandescent lamp filaments can be made. I do not say this egotistically or because I first produced it in a proper condition for its application for this purpose. I make this statement only because I believe it to be a fact." When asked why, if tamidine is the best substance for a lamp filament, it is not used extensively, Mr. Weston explained that owing to complications of a strictly business character this material had not been employed in lamp manufacture to the extent it should have been.

It may be said here for the benefit of those who are not familiar with the nature of tamidine that it is a modification of the substance known as cellulose, which forms the basic principle of most vegetable products. Samples of tamidine made into various forms of lamp filament loops were exhibited at the International Electrical Exhibition of the Franklin Institute at Philadelphia in 1884. The material, too, has found other applications in the arts outside of the one for which it was originally designed.

About the time Mr. Weston commenced the building of dynamos in Newark there was practically no money invested in this line of work in America. The business grew with astonishing rapidity, however, and in 1881 the Weston company consolidated with the United States company of New York. This consolidation led to an increase of capital to $1,500,000. Mr. Weston became electrician of this organization, which was called the United States Electric Lighting company, and under his guidance a large factory was erected at Newark that covered a whole block and gave employment to nearly six hundred hands. He severed his connection with the United States company in July, 1886.

It was but a short time afterward that he started the work of building the present Weston laboratory.

Mr. Weston's first laboratory that was entitled to the name was in the upper floor of his residence on Eighth avenue in Newark. It was here that the most of his experimental work on the hydro-carbon treatment of incandescent lamp carbons, and also the work of designing and developing plating machines and devising electro-plating processes, was done. The next move was to Plane street, where the laboratory occupied the whole lower floor of the Weston residence. All this time, too, the factory was running full blast. This laboratory was devoted exclusively to Mr. Weston's private work. Later on, as electrical industries progressed and more of Mr. Weston's time was demanded at the factory, the laboratory was moved to the works, and it was not long afterward that it became necessary to secure part of an adjoining building as an extension. With these facilities and in these quarters Mr. Weston pursued his work on power transmission problems and continued his investigations along the line of incandescent and arc lighting and other electrical and chemical work. Mr. Weston states that it was in this establishment that the first arc light carbons manufactured for commercial use were made.

When Mr. Weston left the United States company in 1886 and began building his present laboratory, it was with the intention of devoting the rest of his life to experimental work, to the production of inventions, and to purely scientific study. The first line of work undertaken in the new laboratory was upon a complete line of electrical measuring instruments that would be expressly adapted to the use of the practical electrician and electrical engineer. From his long experience in the electrical field, Mr. Weston felt keenly the necessity of simpler instruments than had been heretofore used. With instruments of earlier make there was much labor and many hours lost in making measurements and reducing the readings. One of his first efforts, therefore, was to shorten this time and reduce labor by the production of an instrument to read directly and with accuracy. The present portable standard direct current Weston voltmeters and ammeters were the first commercial results of these laboratory investigations. The factory of the Weston Instrument company at Newark, N. J., in which these instruments are made, is an interesting establishment. A view of the exterior of the works, shown in view No. 1, Fig. 3, will give an idea of the extent of this industry.

FIG. 10. EDWARD WESTON AND HIS ELECTRICAL WORK.

Resembling as it does a watch factory, in so far as the fineness of its product is concerned, it is next to an impossibility to give the reader a thoroughly comprehensive idea of all the details of the work carried on. Of course, a great deal of the work is of the sort that would be more or less familiar to the average mechanic, who had worked on fine machine tools. Thoroughly fitted with the best machine tools of the Brown & Sharpe company, Providence, R. I., the Pratt & Whitney company, Hartford, Conn., and Sloane & Chase, Newark, N. J., as well as a large number of special tools designed by Mr. Weston, the establishment has an equipment of a character that, it is safe to say, is not excelled in any electrical factory in this country or abroad. Some idea may be obtained of the more interesting operations conducted in the factory from the accompanying views. That the reader may the more thoroughly understand what these pictures represent it will be necessary to explain some of the features of the Weston instrument.

In devising his standard instruments, Mr. Weston came to the conclusion that he could not build a satisfactory measuring device embodying soft iron moving parts. He concluded also that the best construction for his instruments would be that in which the magnetic field was one as near as possible to a closed magnetic circuit. Without going further into details it may be said that the present Weston instrument embodies these features. There is but one moving part, Fig. 4. As may be understood from Fig. 5 the air gap is extremely small, so small that it just permits the extremely delicate square coil to swing. It will be noticed that the space within the coil is filled by an iron core. The delicate swinging coil in the larger instruments is made of copper and in the smaller instruments of aluminum. One of the aluminum frames is only .005 inch thick and weighs only three to four grains. An idea of the fineness of the wire on one of these coils may be had when it is understood that it is .009 inch in diameter and costs in the neighborhood of $148 a pound. The permanent magnets employed in the Weston instrument are of course a most important feature. Mr. Weston says that, contrary to a prevailing impression, his instrument magnets are not only aged, but are made as powerful as possible. He further asserts that many are under the impression that the lower the power of a magnet the less is its permanency. His experience, however, has shown him that the stronger the magnet for its size the more permanent is its magnetism. Retardation of the coil's movement is accomplished through the action of the current induced in the little metal frame of the moving coil by the magnetic field. The motion of the coil is opposed by the two spiral springs.

In the instruments now turned out the moving parts are supported in the very best sapphire jewels, made and finished with the same degree of care and skill used on the jewels in the finest watches. The pivots are of hardened steel, ground and highly polished in order to secure and maintain extreme sensitiveness. The aim is to produce a first-class instrument capable of being read to the one-thousandth part of the scale from zero throughout its entire range, and, with fair usage, of maintaining this degree of accuracy unimpared. The most reliable methods of standardizing by direct comparison with certified legal standards are used, thus making these instruments equal, not only to the demands of commercial work, but also to the more rigid requirements of laboratory standards. The instruments are direct reading. No multiplying constant is necessary (except with the high range voltmeters) as a simple inspection of the position of the pointer on the scale gives the value in amperes or volts. Time in making readings is therefore saved, and errors of calculation avoided. All the scale readings begin at zero, and extend by practically uniform increments to the maximum reading. The range is thus greater than is common, while the uniform size of the scale divisions permits of their visual sub-division with uniform accuracy. The instruments are "dead beat." The pointer comes to rest at once, although it is stated that absolutely no friction can be detected, thus reducing the time required for readings, and preventing unnecessary wear of the moving parts; there is no "magnetic lag," giving rise to different deflections with the same current or potential, as in instruments having iron in the moving parts; the temperature correction is negligible, being for the long coil of the voltmeter not greater than one-fourth of one per cent. for a range of 35 degrees above or 35 degrees below 70 degrees Fahrenheit, and for the ammeter less than one per cent. for the same range of temperature.

It is not difficult to understand that a great variety of factory processes must of necessity be carried out before the completed instrument is finally considered fit for shipment. The more interesting of these operations are illustrated herewith.

View 2, in Fig. 3, shows a corner of the factory laboratory in which ammeters of medium range are standardized. Two operators do this work, one calling out the readings of the standard instrument and the other marking the scale. It should be said in this connection that although the scales of the Weston instruments are remarkably uniform, no particular law of deflections is assumed, as must be done when printed or engraved scales are used. Instead, however, a skeleton of each scale is laid out by actual comparison with an accurate standard, and the lines are afterward inked in. Finally, the work is checked by comparison with the same standard.

The current used for this standardizing work is brought from a secondary battery in an adjoining room through heavy copper conductors.

View 3, in Fig. 3, represents a part of the laboratory to

the left and just adjoining that represented in the preceding pictnre. It is here that high reading central station ammeters are calibrated up to a capacity of 10,000 amperes. The method of calibrating these heavy current meters is practically the same as that used in connection with instruments of a lower capacity. The current employed in calibrating is controlled in both processes by specially constructed carbon rheostats. In view 2, of Fig. 3, a rheostat of this sort is clearly shown. It consists essentially of circular carbon plates suspended from metal strips so as normally to hang apart. The contact between these plates, and therefore the resistance of the rheostat, may be changed by a movement of the hand-wheel on a compression screw.

The laboratory proper in the factory is under the management of A O. Benecke, a graduate of the University of Koenigsberg Germany, and for many years identified in Berlin with the manufacture of scientific instruments. Mr. Benecke is assisted by Mr. Lloyd, an electrical engineer from the Lehigh University, and Mr. Hedges. The drawing department is under the direction of M. A. Mueller. Mr. Mueller's connection with Mr. Weston dates back as far as the early days of the electrical business. The general superintendent of the works is L. B. Somerby.

A glimpse showing how three other very interesting operations are carried on is given in view 4, of Fig. 3.

The young lady operative shown at the right in this picture is balancing for all positions what might be called the moving part. This part is shown in detail in Fig. 4 and in position in the magnetic field in Fig. 5. The stand in front of the operator, which carries the part under adjustment, is so devised with universal joints that the part may be tested in any desired position. Tiny screws are inserted to bring the correct balance,

The girl in the center of the pictnre is making a special test to ascertain whether it is correctly balanced for the horizontal position.

The operative at the extreme left is gauging the swinging coil (which constitutes a part of the "moving part") so that its shape will be adjusted with such absolute accuracy that it will move and "clear" the pole-piece faces when it is inserted in its place in the instrument.

In Fig. 6 the workman is forming the little square coil frames. The accuracy with which these must be shaped will be appreciated when the fact is known that in the most delicate Weston instruments the clearance of this swinging coil, of which this frame is an integral part, in its motion between the pole-pieces and the central core is in all .oc9 inch. The finest wire, too, employed on the most delicate coil is .002 inch in diameter. This measurement is of the naked wire without insulation. The wire of this size is about four-fifths the diameter of a human hair.

In Fig. 7 the men are inspecting and testing the jewel bearings used in the instruments. The indicator in the foregronnd will reveal any inaccuracy of the centering of the jewel of 1-11000 of an inch.

In Fig. 8 is presented a view of all the parts of the Weston instrument before assembling.

To leave the reader of the WESTERN ELECTRICIAN without a glimpse of that which is after all dearest to Mr. Weston's heart would be an injustice, besides denying the curious ones a share in the pleasure recently experienced by the writer. Hidden away in the rear of the cosy and homelike Weston residence on High street, Newark, is the present Weston laboratory. It is at the lower end of the lawn, and a glimpse of the picturesque little building is given in the accompanying cut, Fig. 9, view 1. It was in this little eight-room building that Mr. Weston accomplished a great deal of his most excellent work. Entering at the side to the left in the pictnre, the visitor finds himself in the general experimental and power room, view 2, Fig. 9. To the left is clearly shown the photometer that Mr. Weston used for many years during his experimental work on incandescent lamps. Here also are a ten horse power Armington & Sims engine and a Weston five horse power dynamo. These are used with storage batteries for general experimental work.

Adjoining this room, to the left, are two cosy little offices, and on the right, after passing through a tiny boiler room, one finds himself in what Mr. Weston calls his physical laboratory, view 3, Fig. 9.

Upstairs the visitor finds the mechanical department, view 4, Fig. 9, a thoroughly equipped chemical laboratory, view 5, Fig. 9, and a scale room, fitted up with the most delicate balances.

In the machine room, no work of a heavy nature is undertaken, this can be done outside to a greater advantage, but the delicate experimental machine work that is carried on here.

The chemical laboratory is equipped with almost everything that could be required for metallurgical and chemical investigation.

Taken all in all, it may be said that Mr. Weston's cosy little den, if the eight-roomed structure may be so designated, is a place so well equipped for scientific researeh that it would delight the heart of any electrical investigator or other scientific man.

Last, but not least, is the library, which occupies one of the large front rooms in the High street residence. It contains no less than 10,500 volumes. Here it is, as is shown in Fig. 10, that Mr. Weston is seen at his best. In this picture Mr. Weston is shown in company with his associate, R. O. Heinrich, engaged in one of his favorite studies—microscopy.

Mr. Heinrich, it may be stated, is a young scientist of no mean ability, and his work has been and is a valuable aid to Mr. Weston in his instrument investigations. Mr. Heinrich was born in Dresden, Saxony, in 1862, and came to this country in 1884. He received a careful scientific training in Germany and did considerable work as a mining and civil engineer. To acquire a thorough knowledge of electrical engineering he became again a student and took a course along this line at the Lehigh University. After graduating with honors, he first identified himself with Queen & Co., of Philadelphia. Some of the most valuable and best appreciated features of Queen's portable testing sets and various other measuring appliances were devised by him. In 1890 he again engaged in college work as a teacher in the electrical laboratory of his American Alma Mater. The excitement of a business life, however, proved too strong a temptation for him. Having been greatly impressed during a visit with his students to the Weston works with the system there displayed, he made an arrangement through which he represented this concern at the Frankfort Electrical Exhibition. Returning in 1892, after a most successful stay abroad of seven months, he immediately formed a permanent connection with the Weston company. Mr. Heinrich enjoys the entire confidence of Mr. Weston in all business matters and assists him in most of his researches.

The Weston Electrical Instrument company has now agencies in Italy, Austria and Germany; in this country the selling interests of the concern are looked after by Chas. D. Shain.

Chicago Electric Club.

The annual meeting of the Chicago Electric club was held at the club rooms Thursday afternoon, April 20th, at which officers, managers and the committee on membership were elected for the ensuing year. The following named gentlemen were chosen to fill the offices named by a unanimous vote.

President, J. P. Barrett; first vice-president, F. W. Parker; second vice-president, E. Baggot; third vice-president, F. W. Cushing; fourth vice-president, George Cutter; secretary, F. L. Perry; treasurer, J. W. Johnson; managers, F. W. Horne, chairman; L. A. Ferguson, S. A. Douglas, M. A Knapp, J. W. Buckley, E. C. Ferguson, C. T. Page, A. S. Terry, Ben. Williams, L. S. Hills; membership committee, C. C. Haskins, Thomas G Grier, D. G. McDougall.

The new officers were congratulated by those whom they succeeded and by other members. Prof. Barrett on assuming the duties of his new office announced that with the co-operation of the members he believed the new administration could not only keep the organization up to its present excellent standard, but that it could improve and extend the influence of the club. During the present year the club would be called upon to entertain visitors from all parts of the country, and distinguished guests from abroad, and to do this creditably the co-operation of every member would be required. President Barrett concluded his address by expressing his appreciation of the compliment paid him by his associates, and assured them that he would strive to justify the confidence they had expressed in him. At the conclusion of the meeting lunch was served and the remainder of the evening was passed in an informal manner.

The Compagnie des Mines de Vicoigne et de Noeux, France, has invited proposals from the principal electrical firms for an important installation at its mines. The proposals call for the establishment of a central station, which will provide electrical power for the different works throughout the colliery. At present only two dynamos will be put in, the current from which will be utilized at a distance of 4,400 meters for the working of five winding gears of from 6 to 14 horse power. Five pumps operated by electric motors of 5 horse power will be placed at the bottom of the mine, and electric locomotives, each of 12 horse power, will be employed for the conveyance of coal along the principal gallery, which has a length of 2,000 meters. The mine will be illuminated by 26 arc lamps and 200 incandescent lamps, each of 16 candle power. This will be the first installation of its kind in France.

Incandescent Lamp Litigation.

In the United States Circuit Court at St. Louis, April 21st, Judge Hallett handed down his decision on the application of the Edison Electric Light company and others for an injunction against the Columbia Incandescent Lamp company, restraining the latter from manufacturing incandescent lamps. The application was denied. Judge Hallett's decision and the accompanying opinion which are appended were published in an extra issue of the WESTERN ELECTRICIAN immediately after the decree was made. The decision is the first setback which the Edison interests have experienced in the lamp litigation and is certainly an important victory for the Columbia company. Following is the full text of the opinion:

Complainants allege infringement of letters patent No. 223,898, issued to Thomas A. Edison, January 27, 1880, for an improved electric lamp. This patent came under the consideration of the Circuit Court of the Southern district of New York, in the case of the Edison Electric Light company, vs. the United States Electric Lighting company (47 F. R. 454), and was held to be for a lamp "consisting essentially of a filamentary carbon burner, hermetically sealed in a glass vacuum chamber." So understood, it is the incandescent lamp in common use, and no question is presented in this record as to the character of respondents' manufacture. The defense to the bill and to the motion for preliminary injunction now under consideration is want of novelty in the Edison patent. Respondents aver that an incandescent lamp different in form but in all essential features the same as that now in general use was made as early as 1854 by Henry Goebel, of New York city, and that it was used by him in various ways and at different times for many years thereafter. It will not be necessary to describe this lamp at length, as it has the same constituents as the Edison lamp. We are at present more concerned with the struggle between the contending forces, on the one side to maintain and on the other to disprove, the existence and use of the lamp anterior to the date of the Edison invention. A large mass of testimony in the form of affidavits is offered by each party on the question of fact, which, to consider at length, would be a tiresome and unprofitable task.

The principal objection urged by complainant against the Goebel invention is that it has an impossible date; no man could make it in the time and manner assigned to it; the incandescent lamp is the product of several auxiliary arts not likely to fall within the compass of a single mind; as an achievement of science the lamp is a matter of progressive steps, some of which must be made by the world at large before others can be taken by anyone. This is no more than to say that no man can outrun his competitors to any great length in the field of scientific investigation—a proposition which has no support in reason or experience. There seems to be no reason for saying that Goebel could not reach in 1854 the point attained by Edison in 1879, unless, as was said by the dissenting Justices in the telephone cases: "It is regarded as incredible that so great a discovery should have been made by the plain mechanic, and not by an eminent scientist and inventor."

In so far, however, as it may be shown that the methods adopted by Goebel were not equal to the results obtained, the evidence should receive the most careful consideration. On this point it appears that Goebel has recently made several lamps of the form and with the material and tools formerly used by him. These lamps were tested by men of skill and experience in such matters, and they were found to be reasonably effective. They are not so good as the lamps in common use, but they can be operated, and they give reasonable service in time and capacity of light. So that in this way we have prima facie proof of Goebel's ability to make lamps in the way he claims to have made them before the time of Edison's invention.

It is said that Goebel is involved in contradictions and misstatements of facts due to the lapsing memory of old age or to untruthfulness. Be it so; he does not appear to be an adventurer or an imposter. It is not reasonable to believe that he made the story related in his affidavit and did not make the lamp he has described. Whatever may be said as to Goebel's veracity, he is supported at many points by witnesses of good repute who speak with precision and apparently with deliberation. As already suggested, it is not necessary or profitable to go over the testimony at length with a view to determine the relative value and weight of every part. It is enough to say that there is a fair preponderance of testimony in support of the Goebel claim.

There is not the measure of proof demanded by complainants' counsel, who maintain that the Court should require proof of the fact beyond reasonable doubt. This degree of certainty is not often attained upon testimony in the form of affidavits where the issue is contested. And it is not reasonable to demand such certainty as to the defense. Complainants must show a clear right in support of a preliminary writ, and a defense which puts the case in doubt is sufficient to defeat the application. (Goodyear vs. Dunbar. 1 Fisher, 472. Glaenzer et al. vs. Wiederer et al., 33, Fed. Rep., 583. Fraim vs. Sharon Valley Malleable and Gray Iron company, 27 Fed. Rep., 457. Cary vs. Domestic Spring Bed company, 26 Fed. Rep, 38. Robinson on Patents. Sec. 1,171).

It is also contended that the decree of the Circuit Court of New York against the United States Electric Lighting company sustaining the patent, which decree has been affirmed by the Court of Appeals of the Second Circuit, is conclusive of complainants' right to the writ for which they now ask. No doubt is entertained as to the conclusive effect of that decree here and elsewhere, as to all matters in issue in that cause. For although respondent was not

a party to that litigation, the court would not, on a preliminary motion, consider any matter which passed to judgment in that suit. But the Goebel defense was not made in that suit, and therefore the case has not the authority on this motion which has been ascribed to it. (National Hat Pouncing Machine company vs. Hedden et al., 29 Fed Rep. 147. Lockwood vs. Faber, 27 Fed. Rep., 63. The Bailey Wringing Machine Co. vs. F. F. Adams et al., 3d B. & A., 96.)

Another suit by the complainants against the Beacon Vacuum Pump & Electrical company in the Circuit Court of the District of Massachusetts is in a different attitude. In that suit the Goebel defense was made,and upon motion for preliminary injunction recently heard and allowed, it was over ruled. It is contended that the ruling in that case should be recognized and followed as a precedent in respect to the present motion. And perhaps, if the issue, the testimony and the situation of the parties appeared to be the same in both cases, such result might follow more from the persuasive effect of the opinion of another court on the same matter than from any notion of authority ascribed to such opinion. In courts of equal jurisdiction proceeding concurrently in the investigation of the same subject the right and duty of each to exercise independent judgment cannot be denied That they should in the end reach the same result is greatly to be desired, but one cannot become an echo to the other for that praiseworthy purpose. In this instance the consequences to flow from diverse opinions are not regarded as serious. In the Massachusetts Circuit, and here as well, the motion is interlocutory, and in each case the ruling may well enough stand upon the situation of the parties. And we have much additional testimony to that upon which the court acted in the Beacon case; so that upon all points I do not feel compelled to accept the opinion of the court in that case.

The ruling of the court, however, in the Beacon case suggests the propriety of taking security from respondent for observing the decree in case complainants shall ultimately prevail in this suit. There are other considerations also which should have weight in that direction. It was suggested by complainants' counsel that respondent is a concern of small capital, and that it was made so with intent to avoid responsibility in respect to the infringement now alleged against it. This was not denied, and I suppose we may take it to be true. The retort was in the form of a charge against complainant that it used its monopoly of electric lamps to control the sale of all kinds of electrical machinery and apparatus. This charge also passed without denial, and it is not difficult to conceive of circumstances in which it would be necessary to ascertain whether it is true. Referring only to the charge against respondent of sufficient capital and assets, the duty of the court is plain to provide for the contingency of a decision against it. It need not refer to the possible effect of cross-examination in the case of a multitude of witnesses. What now seems plain enough may altogether disappear, and new facts may come to the surface under that crucial test.

The injunction will therefore be refused if the respondents shall give a bond in the sum of $20,000, conditioned for the payment of such sum (if any) as may be decreed in favor of complainants on the final hearing of this case, the bond to be filed with the clerk of the court, and to be approved by the clerk or by a judge of the court, within 20 days from this day.

On Friday afternoon, April 21st, the Columbia Incandescent Lamp company filed a bond in the sum of $20,000, with the clerk of the United States Circuit Court in St. Louis, as required by Judge Hallett's decision. The sureties on the Columbia company's bond were J. H. Rhotehamel, D. E. Garrison and W. O. Garrison. The company has already begun the shipment of lamps, and its works are now in active operation, with an abundance of orders in hand.

The lamp works of the American Electric Manufacturing company, St. Louis, are also being put in shape for immediate resumption of operations. This company expects to begin shipping lamps immediately. The American company closed its factory voluntarily and is, therefore, under no obligation to give bond.

The Brooklyn City & Newtown Railroad company has placed orders for two more directly-coupled generators. The units employed in this station are a 250 horse power generator coupled direct to an 18-30 by 16 Westinghouse compound engine at 250 revolutions. The power staton of this road will contain eight of these generators, of which five are already in place. A single one of these "kodaks" has handled thirty-eight cars over the grades of this road continuously.

In a street car collision at the corner of Tenth and Washington streets, St. Louis, last week, half a dozen people were seriously injured, Two electric cars on the Newton and Bellefontaine road crashed into a horse car of the Northern Central line, and two persons were badly injured about the head and shoulders. They were taken to the hospital. The others were only slightly injured and were removed to their homes. The accident was caused by the neglect of the motorman on the Bellefontaine car to apply the brakes promptly. The Northern Central car had its running gear totally smashed, broken car wheels and pieces of broken axles being strewn right and left.

Two-Phase Alternating Current Motor on Lighting Circuits.

A series of experiments extending over several months has been conducted at Pittsfield, Mass., by the Stanley Electric Manufacturing company with a view of demonstrating the feasibility of operating its two-phase alternating current motors in connection with regular lightning service. Since January 1st, the Stanley company has had in operation at the station of the Pittsfield Electric company one 60 kilowatt two-phase alternating current dynamo, supplying a current over a thin wire system of about two miles in length to 475 lights on thirty transformers, and seven motors ranging from 2 to 10 horse-power each, and aggregating 44 horse power. The connections for such a system are shown in the accompanying diagram, Fig. 1. A view of the two-phase motor is presented in Fig 2. This machine is the joint invention of

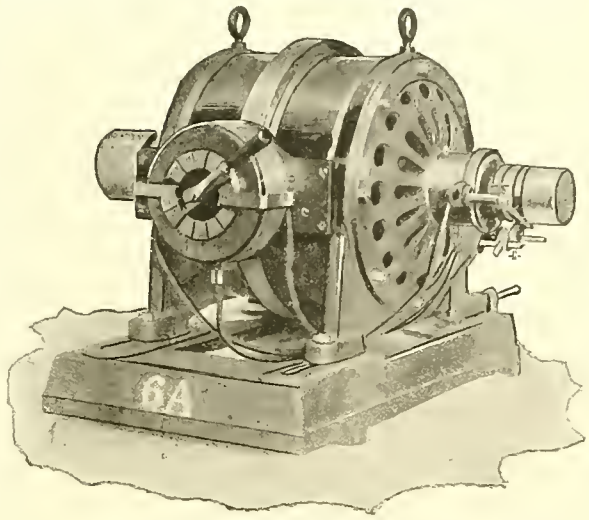

FIG 2. TWO-PHASE ALTERNATING CURRENT MOTOR ON LIGHTING CIRCUITS.

William Stanley, Jr. and John F. Kelly. The motor itself is of the type known as a transformer or two field motor. There are two fields and practically two armatures which act alternately as motor and transformer. The armature is short circuited on itself, the fields only being connected with the circuit. The current is supplied to the two fields by independent circuits in which there is a difference in phase of 90 degrees. It will be seen that this is a distinct type of motor from the so-called rotary field or Tesla type, there being no progressive shifting of the poles in the Stanley-Kelly motor.

The motor is well designed, very compact and without the accessory devices patented by Messrs. Stanley and Kelly, act about the same as other induction motors.

The great difficulty in induction motors heretofore has been the fact that they have taken about as much current on no load as on full load, and in order to overcome this difficulty, Messrs. Stanley and Kelly have resorted to the use of condensers in connection with the motor. Condensers are placed in multiple with each field of the motor in such a way as to furnish the lagging component of the current, with the result that the motor takes current from the generator about in proportion to its load, the same as direct current motors do.

Another element of trouble in the induction type of motors has been the self induction in the armature, and to overcome this the inventors have adopted compensating winding. This consists of short circuited coils placed in the field of the motor in such a way as to neutralize the effects due to the self induction in the armature. This combination gives them an efficient alternating current motor having good starting torque which takes current about in proportion to its load.

The accompanying diagram, Fig. 1, illustrates a two-phase generator from which runs a three wire circuit and shows how a general system of light and power can be operated without separate generators and circuits. Heretofore, it is claimed, a system of this kind would not be commercial on account of the heavy false currents developed by the motor. The generators, lines and motors would have to be exclusively large, and at the same time these heavy false currents would impair the regulation of the system so that satisfactory lighting service could not be accomplished.

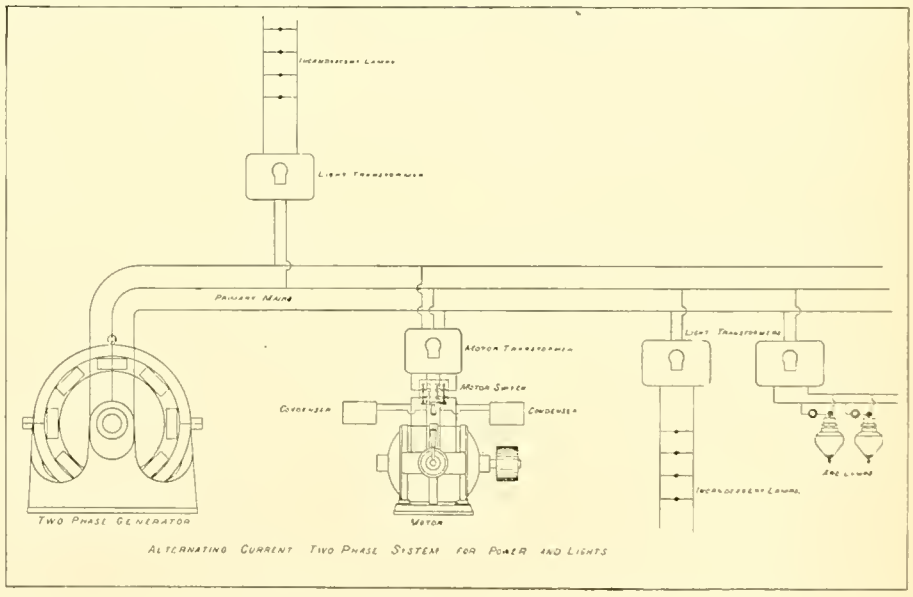

FIG. 1. TWO-PHASE ALTERNATING CURRENT MOTOR ON LIGHTING CIRCUITS.

Thiele Electric Lighting Bill.

When the Thiele electric lighting bill passed the Illinois Senate the WESTERN ELECTRICIAN requested C. H. Wilmerding, of the Chicago Arc Light & Power company, to present his views on the situation. Mr. Wilmerding was instrumental some years ago in forming an association of electric lighting companies in the state for the protection of their interests, and was elected president. He has given this subject considerable attention, and his views upon the Thiele bill, which are appended, will be read with interest:

"Senator Thiele's bill is one which all central station companies must necessarily look upon with disfavor. Aside from its being a measure aimed directly against their interests, it is a move in the direction of a paternal government, which is sure sooner or later to destroy commerce, as it takes away the only incentive which capital has to invest in progressive enterprises. The fact that this bill passed the Senate is to be regretted; whether it will pass the House or not remains to be seen. The chances are, however, that it will do so; and if it does, there is little doubt but that the governor will sign it. As far as its immediate effect on Chicago will go, the city is in no condition, financially, to go into the lighting business. I do not anticipate any competition from the city on this account for some years to come.

"In reference to the State association which you refer I may say that such an Association was formed some years ago, but that the small stations throughout the state seemed to take very little interest in the matter, and we have never been able to arouse enough enthusiasm to obtain a sufficient number of them enrolled. When any such question as this has come up, I have written them, whether they belong to the association or not, calling their attention to the necessity of concerted action, and I think that generally this has had some effect; but as an association we have not been able to accomplish anything in particular, owing to lack of strength."

Missouri Valley, Ia., is to have an electric light plant.

CORRESPONDENCE.

New York Notes.

NEW YORK, April 22.—News of the decision in the lamp litigation at St. Louis aroused considerable interest in this city to-day, in fact it is the only topic of conversation among the electrical people. It was a good deal of a surprise, it is true, but it was a most pleasant surprise to a large number of dealers in incandescent lamps, the manufacture of which had been stopped by the Edison interests. Further developments will be awaited with considerable anxiety. It is not known just what policy the General Electric company will adopt, but it is hardly to be expected that it will discontinue its efforts to control the incandescent lighting business.

The bill which continues the life of the present Board of Electrical Control from November 1, 1893, unlike the bills of the last two years, contains the following clause: "The term of office of the present incumbents shall expire on November 1, 1893, and the mayor of the city of New York appoint their successors for the term of one year at a salary of $5,000 per annum, payable as the salaries of the present commissioners is paid. The successors of the present incumbents shall be subject to removal at the pleasure of the mayor." Under the present law the appointing power is in the governor. Should the new act receive Governor Flower's approval Mayor Gilroy can appoint three new commissioners, who may thoroughly reorganize the board's working force. This consists of an engineer at a salary of $4,800, an electrical expert at $2 500, an assistant secretary, clerk, stenographer and several inspectors at smaller salaries.

In a communication to the Brooklyn Board of Aldermen, Mayor Boody has asked that body to reconsider its action in granting franchises without compensation to the city to the Nassau Electric Railway company, the Kings County Electric Railway company, and the Brooklyn City Railway company. He said these companies were ready to pay large sums of money for the privileges which had been granted for nothing, and suggested that, if unprepared to act at once, the aldermen hold an extra meeting to make provision of a cash compensation that would be just to the city. In case the aldermen should make no provision for some payment for the franchise the mayor will veto the resolutions granting them. Representatives of the interested companies have already notified the mayor that they are ready to give the city a fair compensation for the franchises.

On Wednesday afternoon the last rail was laid of the Yonkers Electric railway connecting Yonkers and Mount Vernon—a distance of about three miles. This road will ultimately run to the Sound by way of New Rochelle.

At Sing Sing on Tuesday evening the Ossining Electric Railway company elected officers as follows: President, Abram S. Underhill; vice-president, John V. Cockroft; secretary, Frank L. Young; treasurer, Samuel E. Tompkins.

The work of laying the tracks for the new electric street railway in North Plainfield was begun last week on Somerset street, and is progressing rapidly. The superintendent hopes to have the line in operation by July 1st.

The Flushing and College Point railway has been tied up since 9 o'clock Thursday morning, when the conductors and motormen went on a strike. Dissatisfaction has existed among the men since the company gave notice some time ago that a new set of rules requiring the men to sign a contract and deposit $25 as a guarantee of good faith would soon be put in force. It is said that at first the men were about evenly divided on the subject, one-half being willing to sign the agreement and deposit the money, but the other half who objected succeeded in winning the rest over yesterday. All cars were run back into the car house and traffic on the road was suspended. The company operates about five miles of track connecting the villages of Flushing and College Point. W. F. O.

Milwaukee Wis.

MILWAUKEE, April 22.—The Edison Electric Light company has begun a suit in the United States Circuit Court for the Eastern District of Wisconsin, against the Electric Manufacturing company of Oconto, for the alleged infringement of the Edison incandescent light patent. The plaintiff asks for an injunction and for computation and payment of damages. It is claimed that 13,000,000 Edison lamps have been sold and that at the present time 1,000,000 are now in use in the United States. It is further alleged that the Oconto company has been manufacturing the Edison lamps at a large profit and at a correspondingly heavy loss to the plaintiff. T. A. Pamperin, Jacob B. Grunert and George Beyer, officers of the Oconto company, are made personal defendants in the case.

John M. Marvin, who is connected with the Davidson theater, has invented a machine for baking brick by electricity. The machine is a simple contrivance, consisting of a table covered with iron brick molds. The table is eight by fourteen feet and holds 1,000 molds. The holes are joined together like pigeon holes. Each mold is the size of a brick which has been pressed but not baked, and has a loose cover so fitted as to follow the brick as it shrinks. The pressed bricks are placed in the molds, the covers adjusted and the current turned on. The iron sides of the molds form the resistance and the bricks are virtually enclosed by walls of fire. When the bricks have shrunk to the right size, the covers automatically turn off the current and the bricks are dumped. By the ordinary process it takes three days to bake bricks, but Mr. Marvin claims that by his process they can be baked in three and a half hours. He also says that by his process the bricks are baked harder and better than by the usual process. In the ordinary method the presence of mineral in the clay causes the bricks to crack, but Mr. Marvin says that in the electrical process the more mineral there is in the clay the better, because it forms a resistance and heats the interior of the brick. Mr. Marvin states that he has sold the right to make brick under his patent for $25,000.

The Milwaukee Street Railway company has not yet taken possession of the West Side railway. The transfer, it had been expected, would occur on April 1st, but the Villard people decided to take advantage of the three months of grace provided in the contract. The third and last payment can be made any time before July 1st. Henry C. Payne, speaking of the matter, said that the delay in taking possession of the other line was due to the stringency of the money market and to the attempts which are being made to enact legislation hostile to street railway interests.

The Wisconsin Automatic Telephone company is making arrangements to establish an exchange at Sheboygan. A list of subscribers is being prepared and it is proposed to place the bulk of the stock among the home capitalists. It is estimated that the cost of putting in a telephone plant at Sheboygan will be in the neighborhood of $30,000.

The Wisconsin Telephone company has had a great deal of trouble recently as a result of the wind storms. In part, at least, the system has been out of order most of the month. The Chicago-Milwaukee wires have just been repaired. The total loss to the telephone interests of the state by the recent storms is estimated at $30,000, which will have to be borne by the general company.

A city ordinance requires street cars to stop within a certain distance of railway crossings. The street railway people have claimed that instead of ensuring the passengers from danger, as it is intended to do, the practice is really dangerous, on account of the likelihood of the trolley coming off and leaving the car powerless in front of an incoming or outgoing train. Their theory was aptly illustrated a few evenings ago at the Clinton street crossing of the St. Paul Railway. A Bay View car stopped at the crossing, the conductor ran ahead and gave the "all right" signal and the car started again. As it reached the railway track, the trolley came off, and a train bore down on the helpless car. It was wrecked, but the passengers escaped before the car was struck.

On City Engineer Benzenberg's desk is a piece of lead pipe which was taken from a residence near the Becker street railway power house and which seems to have been damaged by escaping electric currents. Since the introduction of the trolley system, there have been several cases of this character in the city. Gas pipes and water mains, it is stated, have been damaged by electric currents which escaped into the ground and attacked the pipes and mains by electrolysis. Mr. Benzenberg says that in time the current may do damage to the large water mains of the city. He has a letter from the head of the New Orleans water works suggesting that the matter be discussed at the convention of American engineers which will be held in Milwaukee next fall. Reports of damage to pipes underground by means of electrolysis have been received from Saginaw, Indianapolis, New York and other cities.

The extensive and tedious task of replacing every electric light wire by new ones in the Pabst block is now under way, as a result of unsatisfactory service from the wires put in at the time the building was erected. It was found that the wires used were insufficiently insulated and that dampness effected them in many parts of the building. It was finally decided to put in an entirely new supply of better insulated wire. When it is taken into consideration that something like 30,000 feet of wire is to be put in, and drawn through the conduits in the walls by means of the old wire, the work required will be better understood.

The work of completing the double tracking of the Wauwatosa electric road is now under way. The second track was more than two thirds down when winter weather stopped the work and the small balance will be down in two weeks. Ever since the road was put into operation it has been a paying line, and the stockholders propose to give the best possible service during the coming summer. C.

Northwestern Notations.

MINNEAPOLIS, April 22.—About the worst storm of this particularly stormy winter swept over the Northwest on April 20th. It found the street railway companies arranging for their summer business and poorly prepared for such a return of snow and cold. The service in Minneapolis and St. Paul was badly crippled, particularly in the former city. Stillwater, Duluth and other smaller places were obliged to exist without street cars for some time, and it was a difficult matter to resume traffic Friday.

A sanguine St. Paul paper predicts that within five years every wire in the city will be under ground. The good work is going on slowly but surely, and the wires of two electric light companies are now partly under ground. Most of the telephone wires are down. An ordinance has just been passed which gives the Western Union Telegraph company the desired right to bury wires. The ordiance is general, and not just what the company wanted, but it has been accepted. It provides that all companies operating or controlling electric wires shall place them underground within three years. The St. Paul Gas company purposes to put its electric wires down shortly.

Plans have been perfected for the new power plant of the Winona, Minn., General Electric company. It will be a one-story brick building, 120 by 140 feet. The electric light plant will consist of four 50 arc light dynamos, one 30 arc Thomson-Houston dynamo, and 30 light Edison dynamo, and one new Thomson-Houston incandescent dynamo. The car house will be 40 by 108 feet. Everything about the plant will be made as complete as possible.

The scheme of building an electric line to Lake Minnetonka, the popular summer resort, fifteen miles from Minneapolis, is considered almost every spring, and it has already appeared this season. There is probably no likelihood of its materializing this year, but it is undoubtedly only a matter of time.

The Columbia Electric company of St. Paul has made an assignment to James A. Owens. The company's plant is on Edgerton street, and it also owns a warehouse. Egbert G. Handy is president and F. M. Catlin secretary. Its business was not very extensive. The liabilities and assets are each said to be in the neighborhood of $20,000.

John Luddon has sued the St. Paul Street Railway company for $10,000 because he was run into and hurt while walking along the track.

President Lowry is figuring on getting the famous Gilmore band to play at Lake Harriet this summer as a special attraction.

D. S. Smith, superintendent of construction of the West Superior Iron & Steel Works, has been given a responsible position by the Minneapolis Street Railway company.

Charles F. Baker, for ten years chief engineer of the big Pillsbury flour mills in Minneapolis, has resigned to accept a position in charge of the steam plant of the West End Street Railway company of Boston.

The new electric light company at Grand Forks, N. D., has secured a site and will begin work at once on a solid brick power building, to be completed and equipped by September. There will be a dynamo of 350 horse power and a reserve dynamo of 150 horse power.

In a damage suit against the street railway company Judge Smith of the Minneapolis District Court told the jury that as the company is obliged to run its cars on tracks it is not supposed to exercise as much diligence or care as the driver of a wagon, especially in the middle of a block.

The Stillwater, Minn., street railway tangle continues in bad shape. The receiver appointed a year ago reports that he cannot make the road pay interest on the $60,000 bonded indebtedness.

There have been no important developments in the street railway situation in St. Paul. Petitions are pouring in from citizens protesting against the present condition of things.

Surveyors are at work on the proposed electric line between St. Paul and Stillwater. It will probably be built this year. The route will be around by way of Wildwood.

The St. Paul & White Bear Electric Railway company has commenced running half hour trains to White Bear. Excellent service is planned for this summer.

The city engineer of West Superior, Wis., has recom-

mended that the city furnish its own electric lights. He figures that 300 arc lamps and 25,000 incandescents will cost less than the present arrangement.

It is proposed to extend the Ashland, Wis., electric line to Washburn, Wis. There is a good roadbed, and the distance is but twelve miles. A company will probably be organized.

N. L. P.

New England Notes.

BOSTON, April 22.—The consolidation of the electric street car lines of the Merrimac valley has at last been effected. Yesterday the directors of the Haverhill & Groveland Street Railway company, the Merrimac Valley company, and the Lowell, Lawrence & Haverhill road met in Boston and voted to consolidate, the two former selling out to the last named. The companies retain their old names but will be under one management. The purchasing company has been granted the privilege of building a line over the route desired in Lawrence and work will be soon commenced. Connection will be made through North Andover with the Merrimac Valley road. The main company has purchased land in Haverhill on which it will erect an immense car shop, factory and repair shop.

The West End Street Railway company of Boston has come out victorious in its opposition to the people who applied to the Legislature for permission to build and operate a storage battery street railway in Cambridge. The legislative committee on street railways has reported a bill to give the storage battery promoters permission to withdraw.

The West End Street Railway company has withdrawn all the tunnel scheme plans for rapid transit it had before the Legislature. President Whitney in his letter making this withdrawal stated that he did not feel that they were sufficiently familiar with the Greathead system of tunneling to go on with such a project.

The governor of Maine has vetoed the bill granting a franchise for an electric road between Lewiston and North Corner, a distance of 22 miles, on the ground that there was not population enough to support such a road.

The new building of the International Trust company of Boston is to be equipped with a 500 light dynamo coupled direct. Mather apparatus will be used.

The Lynn & Boston Street Railway company, is to extend its lines to Beverly. There has been a three years' fight against the trolley system, but the opposition is at last overcome. A single fare is to be charged from North Beverly to Salem or Peabody instead of two as in the past. The company will spend about $100,000 in the town this year.

The Norfolk Suburban Street Railway company has been granted a franchise to build an electric road from Dedham Centre to Hyde Park. It will begin work the first of May.

The Lynn Gas & Electric company is to erect a new power station 150 feet square, costing $150,000. It will have a capacity of 2 500 horse power. J. C. E.

PERSONAL.

A. O. Eckert, southern agent for Day's Kerite, is in Chicago. He will take charge of the Kerite exhibit at the World's Fair.

F. J. Hovey, acting general assistant of the American Telephone & Telegraph company of New York, and V. D. Hayes, chief of the mechanical department of the American Bell Telephone company of Boston were in Chicago last week.

NEW INCORPORATIONS.

Beecher Single Railway company, Buffalo, N. Y.; capital stock, $400,000; to manufacture and sell all kinds of electric motive power, locomotives, etc

Madison Electric Light & Power company, London, O.; capital stock, $10,000; manufacturing and furnishing electric light and power; H. H. Prettyman, London, O.

United Light & Power company, Georgetown, Colo.; capital stock, $35,000; to supply the towns of Georgetown and Silver Plume, Colo., with electric and gas light, heat and power.

East Reading Electric Railway company, Reading, Pa.; capital stock, $100,000; constructing and operating an electric railway in Reading, Pa.; Daniel Ermentwart, Reading, Pa.

Concord Light & Power company, Concord, N. H.; capital stock, $200,000; generating, distributing and selling gas and electricity in the city of Concord and vicinity; Leach & Stevens, Concord, N. H.

Hewitt Voltaic Electric company, Jersey City, N. J.; capital stock, $150,000; to manufacture, buy, sell and deal in electric batteries, electrical compounds and supplies, etc.; J. Herbert Potts, Jersey City, N. J.

Duplex Electric Trolley Manufacturing company, Chicago, Ill.; capital stock, $100,000 to manufacture and sell electric trolleys and other electrical appliances. J. M. C. Tyner, 101 Rialto building, Chicago, Ill.

Springfield Consolidated Railway company, Springfield, Ill.; capital stock, $750,000; to buy, lease, construct, maintain and operate horse, dummy, and electric railways in Springfield, Ill.; Frank H. Jones, Springfield, Ill.

Miller Railway Incandescent Signal company, Chicago, Ill.; capital stock, $250,000; to buy, operate and sell letters patent relating to inventions for railway and electric signals; Banning, Banning & Payson, 532 Temple Court, Chicago, Ill.

American Engine company, New Bound Brook, N. J.; capital stock, $200,000 to manufacture steam, gas electric and other engines, pumps, condensers and boilers, and to sell or rent the same, etc.; American Engine company, Bound Brook, N. J.

General Electric & Improvement company, Jersey City, N. J.; capital stock, $500,000; manufacturing, constructing, selling, dealing in, operating and licensing the use of apparatus, etc.; L. A. Chandler, 31 Nassau street, New York, N. Y.

McKeesport & Braddock Passenger Railway company, McKeesport, Pa; capital stock, $50,000; constructing and operating an electric railway in Alleghany county from McKeesport to Braddock; J.P. Humber, 93 Diamond street, Pittsburg, Pa.

Put-in-Bay & Southwestern Electric Railroad company, Tiffin, O.; capital stock, $3 000,000; constructing and maintaining a railroad to be operated by electricity or other motive power, except steam, between Ottawa and Findlay, O; Foraker & Prior, Cincinnati, O.

ELECTRIC LIGHTING.

New Hampton, Ia., has decided to put in an electric light plant.

The electric light plant of Yankton, S. Dak., is to be considerably enlarged.

The Lewiston, Mont., Electric Light & Power company has been formed with a capital stock of $10,000; the company proposes to erect and operate an electric light plant in Lewiston.

A franchise has been granted to the Power City Illuminating company, with the privilege to string wires and erect poles for an electric lighting system for Niagara Falls, N. Y.

On April 6th the electric light plant of Mt. Pulaski, Ill., was wrecked by the breaking of a portion of the machinery. Chief Engineer Stookey and Fireman Edward Wood, were seriously injured.

Boyd Anderson, chief engineer of the Texas-Mexican Electric Light company's power station at San Antonio, Texas, has contracted with the Southern Pacific Railroad company for a trial of his storage battery for lighting the passenger trains on the road. A car is to be equipped with the storage batteries and a number of incandescent lamps at once and put on between San Antonio and Sanderson as an experiment. If it prove satisfactory all the trains on the road may be similarly equipped.

The Chester Light, Water & Ice company is now receiving bids on a central lighting station, to be constructed at once, at Chester, Ill. Proposals on the entire work, or any part of it will be received until May 15th by Wm. H. Bryan, mechanical and electrical engineer, room 56 Turner building, St. Louis, where plans, and specifications may be seen. The plant will consist of one 35 light arc machine, and two 500 light, 2,000 volt alternators, with engines, boilers, etc. Contracts have already been signed in Chester for about 1,100 lights.

ELECTRIC RAILWAYS.

The Mobile Light & Railway company, Mobile, Ala., has closed the contract for the electrical equipment of its lines.

The Consumers' Electric Light & Railway company, Tampa, Fla., is shortly to add ten additional miles to its tracks.

An electric road twenty-five miles in length, to run from Southbridge, Mass., to a point in Windham county, Conn., is being projected.

The Court Street and East End and the West Side Railways companies of Binghamton, N. Y, will shortly equip their lines with electricity.

J. K. Tillotson's electric railway known as the Put-in-Bay Southern, of Toledo, O., is to be extended to Lakeside. Work will be commenced upon the new road at once.

The Sioux City, Ia., Street Railway company has closed a contract to operate the elevated road in the city in connection with its other lines, and will assume control of the road as soon as it can be equipped with an electric system.

The Waterloo County Electric Railway company has been organized with a capital stock of $450,000 to build an electric railway from Galt, through Preston, Freeport and Berlin to Waterloo, Ont. The company also intends to utilize the water power of the Grand river.

Upon application of the St. Louis Trust company, trustee of the bondholders, Judge John A. Williams, of the United States Circuit Court, placed the City Electric & Capital Street Railway company of Little Rock, in the hands of a receiver on April 19th. Col. S. W. Fordyce, president of the St. Louis & Southwestern (Cotton Belt) railway, was appointed receiver and his bond fixed at $100,000.

The agreement between the municipality of Peterborough, Canada, and the Canadian General Electric company for the street railway franchise has been signed by both parties. The rails for the railway have been ordered from Europe, and the electrical appliances will be made in the company's own shops at Peterborough. Work will be begun as soon as the ground is ready, and several miles will be constructed this year.

Permission has been granted by the authorities of the three towns of Northbridge, Sutton and Crafton in the Blackstone Valley for the construction of an electric road to connect these towns with Worcester, Mass. There is little doubt that the line will ultimately be extended to Uxbridge to meet the proposed line from the south, thus making an electric connection between Providence and Worcester. The company obtaining the franchises mentioned is the Blackstone Valley Street Railway company.

A public demonstration of the Waddell-Entz storage battery system was given last Saturday on the Second avenue route in New York. It would appear that the test was deemed successful; the trial from One Hundred and Twenty-seventh to Ninety-sixth street having been made in eighteen minutes and without a mishap. A party consisting of the officials of several lines of electric railways in the city and a number of electrical men made the trip and expressed themselves as pleased with the system. In the Waddell-Entz car the storage batteries fill the space under the seats, seventy cells being in each side, while the motor is situated under the middle of the floor. With one change it is claimed by the promotors of the system the batteries will propel the car thirty miles, and then can be recharged without being removed. The directors of the Second avenue line are satisfied with the test.

TELEGRAPH.

The central telegraph exchange at Paris, France, is simply a bureau of transmission, and neither directly receives nor distributes dispatches. It transmits 36,250 telegrams daily and furnishes employment to 500 men and 400 women.

The report telegraphed from Halifax, recently that the Commercial Cable company's cable across the Atlantic was broken is denied officially. The story arose from the fact that the Mackay-Bennett steamer had been sent out to do some subsidiary work.

TELEPHONES.

The Missouri, Kansas & Texas Telephone company of Kansas City, Mo., will put in a telephone exchange at Guthrie, Ok., at once.

In April, 1882, the telephone system was introduced in Berlin, Germany, with fifty subscribers. By the end of the year the number had increased to 458, and at the first of this year 20,000 telephones were in operation at the German capital.

The computed total number of telephone exchange connections yearly throughout the United States has advanced from 312,605,000 in 1886 to 600,000,000 in 1892.

From Portland, Me., to Spokane, a distance of about 400 miles, an overhead telephone line is to be built, and to this line, two-thirds of which will be owned by the Inland Telegraph & Telephone company, the Pacific Telephone & Telegraph company will contribute.

The Missouri Pan-Electric Telephone company organized at St. Louis, April 19th, with Sam Kennard as president. The new company announces that it will take advantage of the expiration of the Bell patents and erect lines at once. The same company put in a large number of instruments in 1886, but was defeated by the Bell company in a lawsuit and its telephones confiscated.

Miss Mary K. Sands, who owns a farm in Darien, Conn. is showing persistence in repelling the invasion of her land by telegraph linemen. The Postal Telegraph company has been at work running a line through the town and, it is said, has omitted to obtain permission of some property owners. When the men appeared on Miss Sands's place last week she made an emphatic protest. They paid no attention to this, so she went up to the village and hired four men with instructions to fill up the holes dug by the telegraph men as fast as the latter threw the dirt out. There was a conflict between the two forces, and by night four poles were set. On the following morning, when the linemen came to work, they found the poles flat on the ground, having been sawed off at the surface during the night. All the second day the two gangs of men bothered each other, neither making any headway, but no open rupture took place. Miss Sands is determined that no poles or wires shall be erected or strung across her farm, and has employed counsel to get an injunction.

LEGAL DECISIONS.

The contest between the Lynn Gas & Electric company and twenty three insurance companies was recently decided in the Supreme Court at Boston. In October, 1890, fire was discovered in the company's building and was extinguished with trifling loss, but the great Corliss engine, 50 feet from where the fire originated and completely separated from it, was destroyed. The company claimed that the fire caused a general short circuiting of the system; that this strained and broke a pulley, and that a flying fragment from the broken pulley struck and disabled the governor of the engine, in consequence of which the engine destroyed itself and the building. The case was first tried in Salem and decided in favor of the Gas & Electric company. It was appealed to the Supreme Court, which has now affirmed the decision of the lower court and has awarded the electric company $12,000 damages.

MISCELLANEOUS.

The annual meeting of the Michigan State Electric and Surgical society will be held at Lansing, May 10th and 11th.

H A. Learned, Tokio, Japan, recently visited the Thomson-Houston factories in Lynn, Mass., in the interests of an electrical plant in Tokio.

TRADE NEWS.

George Cutter, Chicago, will move on May 1st to 851, 853 and 855 Rookery building. The new offices, together with an enlarged storeroom, will give Mr. Cutter additional facilities for taking care of his growing business.

The Chicago Electric Wire company of Wilmington, Del., is claiming a great many superior merits for its high grade insulated wires. It asserts that the insulation resistance of its wire is five times higher than formerly, that it can stand any amount of bending and twisting without deterioration.

The Interior Wiring & Fixture company, 14 Clinton place, New York, is making particular exertions to place its Klein push-button switch for electric light circuits on the market. The company claims for this switch that it is very simple in construction, safe to use, and is quick acting. The company is also making a specialty of its flush or wall switches and its handy pendant or flexible cord switch.

The Gray National Telautograph company, New York, has gathered comments on the new invention of Prof. Gray from the daily papers and scientific journals whose representatives witnessed the first public test of the instruments in Chicago and New York, and has presented extracts in pamphlet form. An idea of the general interest which Prof. Gray's invention has aroused will be gained from a perusal of this collection.

The contract for the new power house of the Newton & Boston street railway at Newtonville, Mass., has been awarded to Westinghouse, Church, Kerr & Co. The steam pressure will be 130 pounds, using Babcock & Wilcox boilers. The generator room will contain two Westinghouse compound condensing engines driving Thomson-Houston multipolar generators. The original installation is for 400 horse power, and the station is to be in operation July 1st.

S. F. B. Morse of Cushing & Morse, agents for Day's Kerite, has just returned from the Northwest with a large number of orders. Mr. Morse is exhibiting an unique sort of advertisement in the form of "spelling sparks." A manager of an electrical plant is illustrated as advising a discouraged station manager to tear up his old circuits and put in a good wire. Upon being asked what wire to use, a spark is touched to the end of a cigar in the hand of the manager, and a traveling spark burns "Kerite" in the paper.

The Electric Appliance company of Chicago has recently made a number of small improvements in its Acme lamp socket, which add largely to the merits of the socket. The new socket is being sold, however, at even a lower price than formerly, and the demand is very large. A novelty in the incandescent lamp line is being exhibited by the same company. It is the latest thing out in the Packard lamp line, being a small 6 candle power lamp with a bulb about 1 1-2 inches in diameter mounted to fit any regular socket and of any ordinary voltage up to 52 volts. It is known as "Our Baby."

The American Silk Manufacturing company, Philadelphia, Pa., is calling attention to its raw silk machine wiper. These wipers have been extensively endorsed by underwriters as doing away with the danger of spontaneous combustion so common with the use of cotton waste, and in addition to this advantage they present the merit of economy owing to greater durability. No boiling is required for these wipers as the company furnishes a box containing a special compound for renovating the old wipers. The success met with in introducing this specialty is the surest guarantee of its worth.

The Electric Selector & Signal company, New York, will make a complete exhibit in the Department of Electricity, at the World's Fair, of the principle of individual electrical selection in its several applications. There will be shown in operation, a number of railroad semaphores and train order signals, six telegraph stations, six arc lights, several groups of incandescent lamps, four electric motors and a telephone circuit with four or five stations. At one end of the space will be a stand representing a central light station at which will be located the transmitter for cutting in and out the electric lights and motors, and at the other end will be a similar stand representing a railroad train dispatcher's office from which the various signals and telegraph stations will be controlled.

No more complete or comprehensive catalogue of electrical supplies has been issued than the book recently published by the F. P. Little Electrical Construction & Supply company of Buffalo, N. Y. One of the features of the catalogue is the chapter on information for steam and electrical engineers, giving minute and particular directions for placing dynamos, their care and accessories. The F. P. Little company is making a particular speciality of the Kester improved arc lamp, the patent of which it has recently secured, which is claimed to be far superior to other arc lamps. The incandescent lamp department of this company is very extensive and complete, and the cut-outs, switches, fan motors, insulators, batteries and meters are illustrated and described in a most thorough and satisfactory manner.

The Ansonia Electric company, formerly the Electrical Supply company, Chicago, reports continued large sales for its [illegible] brand moisture proof wire. The company continues to receive flattering reports from the Helios arc lamp, which is used on incandescent circuits, for which it is the western agent. One of the specialties manufactured by this company is the W-W lightning arrester. The sales on this article are most satisfactory, and as it is built on the latest theoretical principles its ultimate success can not be doubted. An order has been placed with this company by the electrical engineering department for the World's Fair for three Wirt volt indicators to read to 3,250 volts. These instruments will be used for testing circuits during the World's Fair. Another order for Wirt indicators was received for the Chicago Athletic building, Columbus building, Lexington hotel, Chicago, and the Cicero, Ill., Electric Light & Heat company.

BUSINESS.

The J. H. & D. Lake company, Massillon, O., manufacturer of friction clutch pulleys, cut-off couplings and other mechanical specialties is presenting the trade with a transparent glass paper-weight that is attractive in appearance and is as excellent in its way as the high grade of work this company turns out.

Two hundred miles of road have been equipped within three months by the Ansonia Electric company, Chicago, with its improved overhead railway appliances. It also reports having secured some very large contracts within the last month, and is to be congratulated upon the success with which its new material has met.

The Electric Appliance company, Chicago, has taken the agency for the Diehl ceiling fans and has already secured a number of contracts for installations in Chicago stores and restaurants. The large equipment recently placed in the "peacock annex" of the Boston Oyster House is a standing advertisement for the Diehl fan.

The Ball Engine company, of Erie, Pa., reports that it is flooded with orders and that its already large capacity is insufficient to meet the demands made upon it. The company is particularly successful in its compound and tandem engines and reports twenty-three recent shipments of engines varying from twenty-five to three hundred and fifty horse power each.

The Ansonia Electric company, formerly the Electrical Supply company, Chicago, is now placing on the market what it considers the most important specialty ever added to its line; that is, the new Sunbeam incandescent lamp, which was described in detail in the last issue of the WESTERN ELECTRICIAN. A good many claims are made as to its superiority, and it is thought by the manufacturers to be clearly outside of all lamp patents.

Out of all the buildings under construction in New York city since January 1st, for which the architects' specifications name electrical equipment, two only are using other than the interior conduit system. The metal covered conduit is now generally specified by architects. It is estimated that in the remodeled residence of Cornelius Vanderbilt at Fifty-seventh street and Fifth avenue, 100,000 feet of brass covered interior conduit will be used by the Tucker Electrical Construction company, which has the work in hand.

The United Electric Improvement company of Philadelphia, Pa., formerly the Heisler Electric company, manufacturers of complete central station equipment, which has handled the Heisler long distance series apparatus so successfully, intends to increase its business facilities. A new factory will be erected with the addition of improved machines and tools for the manufacture of all types of lighting and power apparatus and no pains will be spared to make this factory one of the most perfectly equipped for the manufacture of electrical supplies in the country.

The works of the Westinghouse Machine company have been running for a year with a full night force. The shops are crowded with a large amount of heavy work in addition to the regular line of manufacture. There are now coming through ten 600 horse power compound engines, of which eight are for the Philadelphia Traction company, for direct coupling to multipolar generators, and two are to fill an order placed by E. D Leavitt for the Calumet and Hecla mines, to be used in driving electric pumps for mine drainage. The company has just completed the shipment of six 1000 horse power engines for the Westinghouse Electric and Manufacturing company, to be used in filling its contract for lighting the World's Fair. These engines are also coupled directly to 10,000-light dynamos. They stand eighteen feet high and make 200 revolutions per minute.

ELECTRICAL PATENTS.

Issued April 18, 1893.

495,472. Yarn-feeding Device for Knitting Machines. Emanuel Buxtorf, Paris, France.

495,513. Insulated Pipe Joint or Coupling. Thomas J. Pierce, Philadelphia, Pa.

495,538. Dynamo-electric Machine. Thomas L. Willson, Brooklyn, N. Y.

Two or more brushes are applied to each field of force, so that the bars passing through one field may be connected serially instead of being necessarily in multiple. If six brushes are applied to each field the electromotive force derivable therefrom is increased six times.

495,547. Combined Electric Motor and Driven Machine. Rodolphus Fuller, Detroit, Mich.

495,550. Process of Concentrating Zinc Bearing Sulphide Ores. Gustave M. Gouyard, Denver, Colo.

495,552. Insulator. Louis Hills, New York, N. Y.

495,561. Commutator for Dynamo-electric Machines or Motors. Buchanan S. Paterson, Gateshead, Eng.

495,562. Field Magnet. Frank A. Perret, Springfield, Mass.

The field magnet is constructed in two parts, connected by a wedge or V-shaped joint. The joint is made in the iron core of the field magnet, and is surrounded by a coil of wire.

495,564. Electrical Bell. Henry B. Porter, New York, N. Y.

495,582. Ground Generator of Electricity. Michael Emme, Oakland, Cal.

The electrodes consist of soft iron and carbonized coke. These are placed in holes made in the earth, in which is placed a mixture, which, in combination with the earth material, makes an active agent. The substance employed in connection with the earth depends upon the character of the earth. If the ground is a vegetable mold, commercial concentrated nitric acid is used to saturate the coil, and peroxide of of manganese or pyrolusite should then be mixed with the mass.

495,587. Ship's Log. Charles F. Holt, New London, Conn.

495,588. Indicator Mechanism for Type-setting Machines. John Hooker, Beccles, Eng.

495,600. Electrolytic Apparatus. Gustaf O. Rennerfelt, Stockholm, Sweden.

495,601. Electric Arc Lamp. Frederick T. Schmidt, Bradford, Eng.

The upper and lower carbons are supported upon brackets which are capable of excursions upon vertical rods. A cord connects the two brackets and passes over a pulley. By means of proper lamp mechanism the upper bracket is lowered and the lower bracket raised when the carbons are to be brougnt together for the establishment of a proper arc.

495,608. Magnetic Ore Separator. George G. Crosby, New York, N. Y.

A magnetized drum or wheel is employed, over which passes an endless apron. The substance to be treated is fed upon this apron. The magnetic particles are retained upon the apron as it passes under the magnetic drum until they pass out of the magnetic influence of said drum. The non-magnetic particles fall from the magnetic drum when at a vertical tangent to the drum.

495,615. Cross-over Switch for Electric Railways. Frank B. Rae, Detroit, Mich.

495,620. Incandescent Electric Lamp. Eugene W. Applegate, Chicago, Ill.

A strip or washer of platinum or kindred metal is interposed between the neck of the bulb and a plug of glass or other substance which supports the leading-in wires and filament.

495,626. Electric Welder for Wire Fence Machines. John D. Curtis, Worcester, Mass.

495,632. Life-saving Device or Fender. William E. Holmes, Boston, Mass.

495,637. Process of Extracting Zinc by Electrolysis. Johannes Pfleger, Frankfort-on-the-Main, Germany.

495,638. Secondary Battery. Leslie B. Rowley, Ashland, Wis.

495,643. Electric Arc Lamp. William A. Turbayne, Detroit, Mich.

A fine wire solenoid is included in a shunt of the main circuit and a cut-out magnet in the main circuit. A gravity ring clutch is allowed to fall and support the upper carbon when the cut-out magnet is energized to release a detent. When the carbons become abnormally separated the solenoid is energized and the gravity ring clutch released from the carbon rod until the proper arc is again established.

495,649. Electric Arc Lamp. Charles F. Adams, Morrison, Ill.

495,674. Rail Circuit-closing Contact. Friedrich von Hefner-Alteneck, Berlin, Germany.

A piston is placed intermedially between the rail and a vessel containing mercury. As the piston is depressed by pressure upon the rail the mercury is caused to rise within another vessel whereby electric circuit is closed by a wire or other electrode becoming immersed in the mercury.

495,692. Trolley Wire Finder. Charles G. Cleminshaw and William H. Bradt, Troy, N. Y.

495,695. Electric Railway Trolley. William Duncan, Allegheny, Pa.

495,714. Lightning Arrester. Elihu Thomson, Lynn, Mass.

495,738. Electric Rotary Drilling Machine. Robert M. Jones, Salt Lake City, Utah.

495,770. Time Indicator and Signal for Races. Alfred Bartlett, Auckland, New Zealand.

495,772. Electric Arc Lamp. Ernest E. Beauvalet and Leon C. Beauvalet, Paris, France.

Two solenoids are employed, one in circuit with the carbons and the other included in a shunt circuit. A lever arm connects the cores of the solenoid. The lower carbon holder is supported upon a cord or chain, one end of which is secured to the lever arm, while the other is passed about a drum. When current is first established the main circuit solenoid is energized, which causes a pawl to rotate the drum and unwind the cord sufficiently for the proper separation of the carbons for the establishment of the arc. When the carbons are abnormally separated the solenoid included in the shunt operates the pawl to re establish a proper distance between the carbons

495,782. Electric Shoe Sole. Rufus F. Carnes, Winfield, Ala.

495,835. Matrix Making Machine. Casper L. Redfield, Minneapolis, Minn.

495,853. Lightning Arrester. Elihu Thomson, Swampscott, Mass.

495,861. Electric Belt. George F. Webb, Cleveland, O.

495,913. Danger Signal for Railway Crossings. James S. Savage, jr., Detroit, Mich.

495,928. Safety Attachment for Cars. Robert Bustin and Thomas J. McMackin, Boston, Mass.

495,929. Electric Cigar Lighter. William Carter and Charles E. Willey, Louisville, Ky.

495,932. Electric Lighting System. Henry Edmunds, jr., London, Eng.

495,936. Apparatus for Preventing Obstructions to the Flow of Oil in Oil Wells. Fulton Gardner, Chicago, Ill.

495,940. Electric Trolley. Jeannot W. Kenevel, Chicago, Ill.

495,941. Electric Motor or Generator. William Koedding, St. Louis, Mo.

495,951. Incandescent Electric Lamp Holder. Leroy C. Whitney, Jr., Milwaukee, Wis.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect"

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

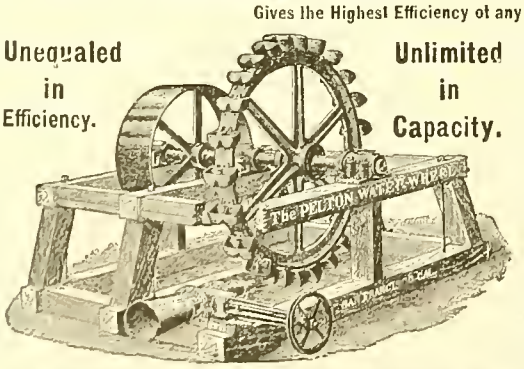
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 10 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.,
121-123 Main St., San Francisco, Cal., U. S. A.
143 LIBERTY STREET, - - NEW YORK.

☞ It having come to our notice that our patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted.

PELTON WATER MOTORS. Varying from the fraction of 1 to 15 and 20 horse power, unequaled for all light running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ Send for Motor Circular. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates.

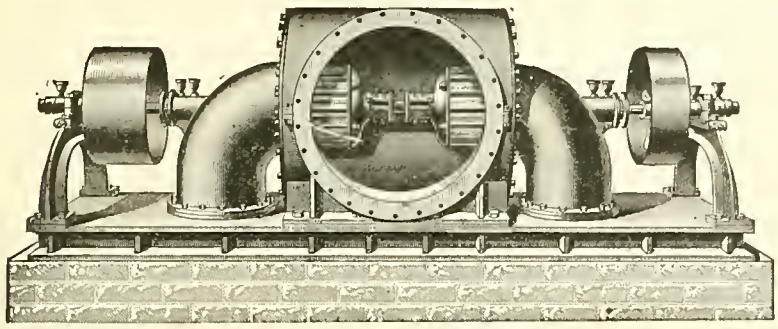
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 6¼ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $21,193.56, with interest from the 22d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,
Receiver of the Milwaukee Electric Railway Company.

ARMATURES REWOUND.

Street Railway and Electric Lighting Companies will find it to their interest to write for prices, as we do all kinds of electrical repair work.

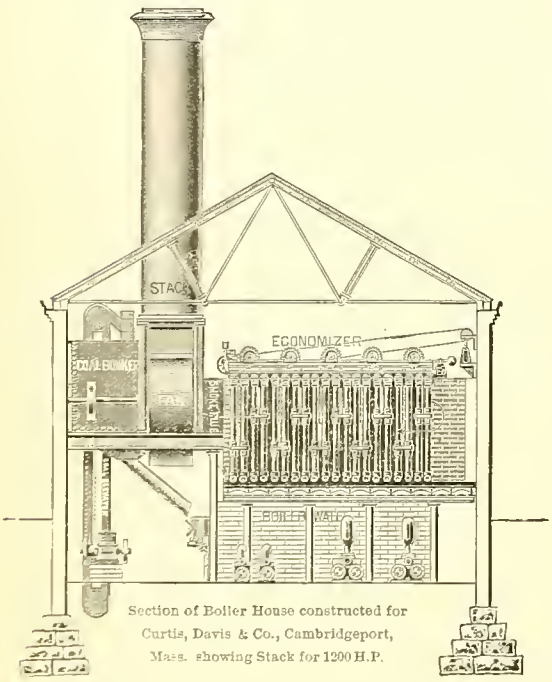
ALBERT SECHRIST,
Manufacturer and Patentee, DENVER, COLO.



Section of Boiler House constructed for Curtis, Davis & Co., Cambridgeport, Mass. showing Stack for 1200 H.P.

BEING A MANUFACTURER you are forced by competition to keep in touch with all genuine economies as soon as their value is proved; hence your Compound Engines, Condensers, Steam Loops, etc., to reduce **the cost of using your Steam.** It is equally important that you should consider every item which enters into **the cost of making your Steam.**

If you are building a new Boiler House, resetting your old boilers or adding new ones:
If your present boilers are short of capacity:
If you wish to raise their evaporative duty to the level of expert hand firing, **and keep it there all the time:**
If you wish smokelessness by **preventing,**—not **concealing** or **consuming** the smoke:
If you wish to preserve your boilers from unequal strains.

YOU WILL CAREFULLY CONSIDER MECHANICAL STOKING.

If you wish to save the whole cost of handling, which in large plants is the greater part of the labor item:
You will equip with simple, cheap and practical

Coal and Ash Handling Machinery.

If you wish to have your fires always under control, irrespective of atmospheric conditions, quality of fuel, or length of run:
If you wish to be independent of extraordinary or sudden demands for steam:
If you wish to save a large portion of the cost of a chimney with its foundations—**and above all,**
If you wish to return into your feed water the greater portion of the heat otherwise sent up the flue to make draft,

You Will Use Mechanical Exhaust Draft and Economizers.

It is a well organized Department of our Business to design and construct Boiler Plants, comprising any or all of the above features, as good judgment may determine. We assume an authority in this branch of Engineering arising from an experience with over 750,000 Horse Power of Boilers equipped with Stokers.

LOUIS K. COMSTOCK,

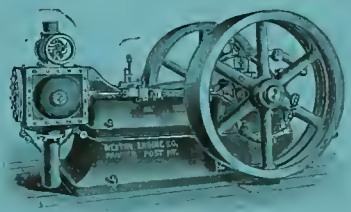
Electrical Engineer and Contractor.

TESTS, PLANS, SPECIFICATIONS AND SUPERVISION
For all Kinds of Electrical Installations.

ELECTRIC CONSTRUCTION.

1419 Monadnock Building, Chicago.

WESTON ENGINES.



HIGH PRESSURE BOILERS.
COMPLETE POWER PLANTS.
ESTIMATES AND DRAWINGS SUBMITTED.

WESTON ENGINE CO.,

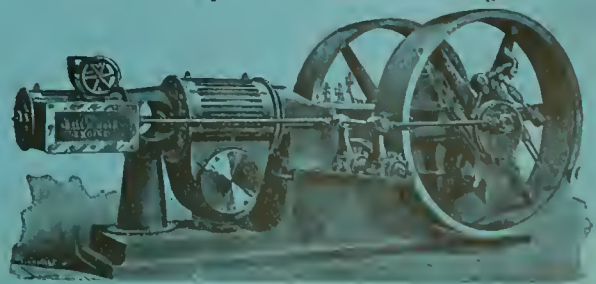
Painted Post, N. Y.

REPRESENTATIVES:
Julian Scholl & Co., 126 Liberty St., New York.
Geo. D. Hoffman, 82 Lake St., Chicago, Ill.
H. M. Seiple & Co., 34 & Arch Sts., Philadelphia.

Jewell Belting Co., Hartford, Conn.

THE BALL & WOOD COMPANY,

Builders of Improved Automatic Cut-off Engines.



AGENTS:

W. B. Pearson & Co., Home Ins. Bldg., Chicago, Ill.
W. A. Day, 128 Oliver St., Boston, Mass.
F. H. Whiting, Jacobson Block, Denver, Colo.
James & Co., Chattanooga, Tenn.
William M. Porter, Detroit, Mich.
T. W. Anderson, Houston, Tex.

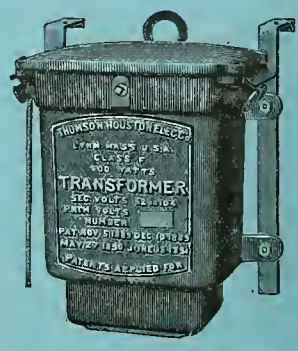
TRANSFORMERS

PERFECT SAFETY.

GOOD REGULATION.

30,000 WATT TRANSFORMER.

HIGHEST EFFICIENCY.



SMALL CORE LOSS.

CONVENIENCE IN INSTALLATION.

OIL INSULATION.

Best Possible Mechanical Insulation, with Additional Insulation of Oil. Core Ground Wire. Primary and Secondary Coils Fully Subdivided. No Fuses in the Transformer Case.

Every Transformer which Leaves Our Factory will Withstand a Pressure of 5,000 Volts Alternating.

THE SPECIAL ATTENTION OF STATION MANAGERS IS DRAWN TO OUR 15,000 AND 30,000 WATT TRANSFORMERS.

TRANSMISSION OF POWER BY ELECTRICITY OVER LONG DISTANCES

Is rendered practicable by means of our "Step Up" and "Step Down" Transformers, the Insulation in which is Tested to Withstand a Pressure of 10,000 Volts Alternating.

GENERAL ELECTRIC COMPANY,

BRANCH OFFICES:

173 and 175 Adams Street, CHICAGO, ILL.

44 Broad Street, New York.
Fifth and Race Streets, Cincinnati, O.
Equitable Building, Atlanta, Ga.
15 First Street, San Francisco, Cal.
Masonic Temple, Denver, Colo.

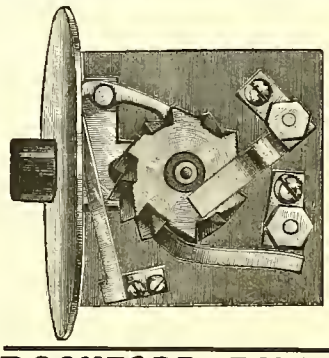
Manufacturers and Owners of Woltman & Triggs'



"STANDARD"

Single Push Button Flush

SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this Switch single pole, double pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

ROCKFORD DYNAMOS AND MOTORS.

178 Devonshire St.,
BOSTON, MASS.

THE WESTON STANDARD PORTABLE

DIRECT CURRENT VOLTMETERS AND AMMETERS

Are used in all parts of the civilized world. They are recognized by all authorities as the very best instruments ever produced.

During the past year Mr. Weston has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. ***The New Model*** is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the ***acme*** of perfection, and is destined to become and remain

THE STANDARD PORTABLE INSTRUMENT OF THE WORLD.

We have perfected a larger model of these instruments expressly adapted for use as ***absolute standards*** in stations and laboratories. They are designated as the

Weston Laboratory Standard Voltmeters AND Ammeters.

The scales are about three times the length of the ordinary portable standards, and the instruments are sufficiently sensitive to work to within 1-75 of one per cent. We confidently recommend them as the most convenient and accurate standards known. They are adapted for the most exact work, and will be found thoroughly equal to its requirements.

We make twenty-two ranges of

The Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants. ***We make multipliers for use with these instruments*** to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-Board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

In three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features. They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy voltmeters.*** They are specially designed for switch-board use. We are also making a large line of high grade

Station Ammeters

In ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable, well made and moderate in price.

EUREKA

DYNAMO BELTING.

CHARLESTOWN, N. H., Aug. 18, 1891.

PAGE BELTING CO. *Dear Sirs:*—In April, 1891, at your request, I made a careful test at your works of the driving capacity of various belts. Your Eureka Dynamo (slotted) Belt proved that the slotting not only still further diminished the slip, but that it materially increases the power attainable, in this respect surpassing one of the "perforated" belts (so-called) which was tested at the same time under the same conditions. The slotting is a decided advantage to the belt. This belt, under a very light strain, showed results which surpassed all others of which I have any record.

Yours very truly, SAMUEL WEBBER, M. E.

NOTICE

January 27, 1893.

To the Electrical Trade:

I have this day assigned the entire interest in the Cleveland Switch, Patent No. 391,512, to THE BRYANT ELECTRIC COMPANY, of Bridgeport, Conn., together with the tools, patterns and moulds for making the Switches and Arc Cut-outs formerly manufactured and sold by THE FOREST CITY ELECTRIC WORKS, of Cleveland (Factory, Geneva, Ohio).

I trust that my former friends and patrons will extend to them the same good will and patronage that they have shown me in the past.

Very respectfully, (Signed) W. B. CLEVELAND.

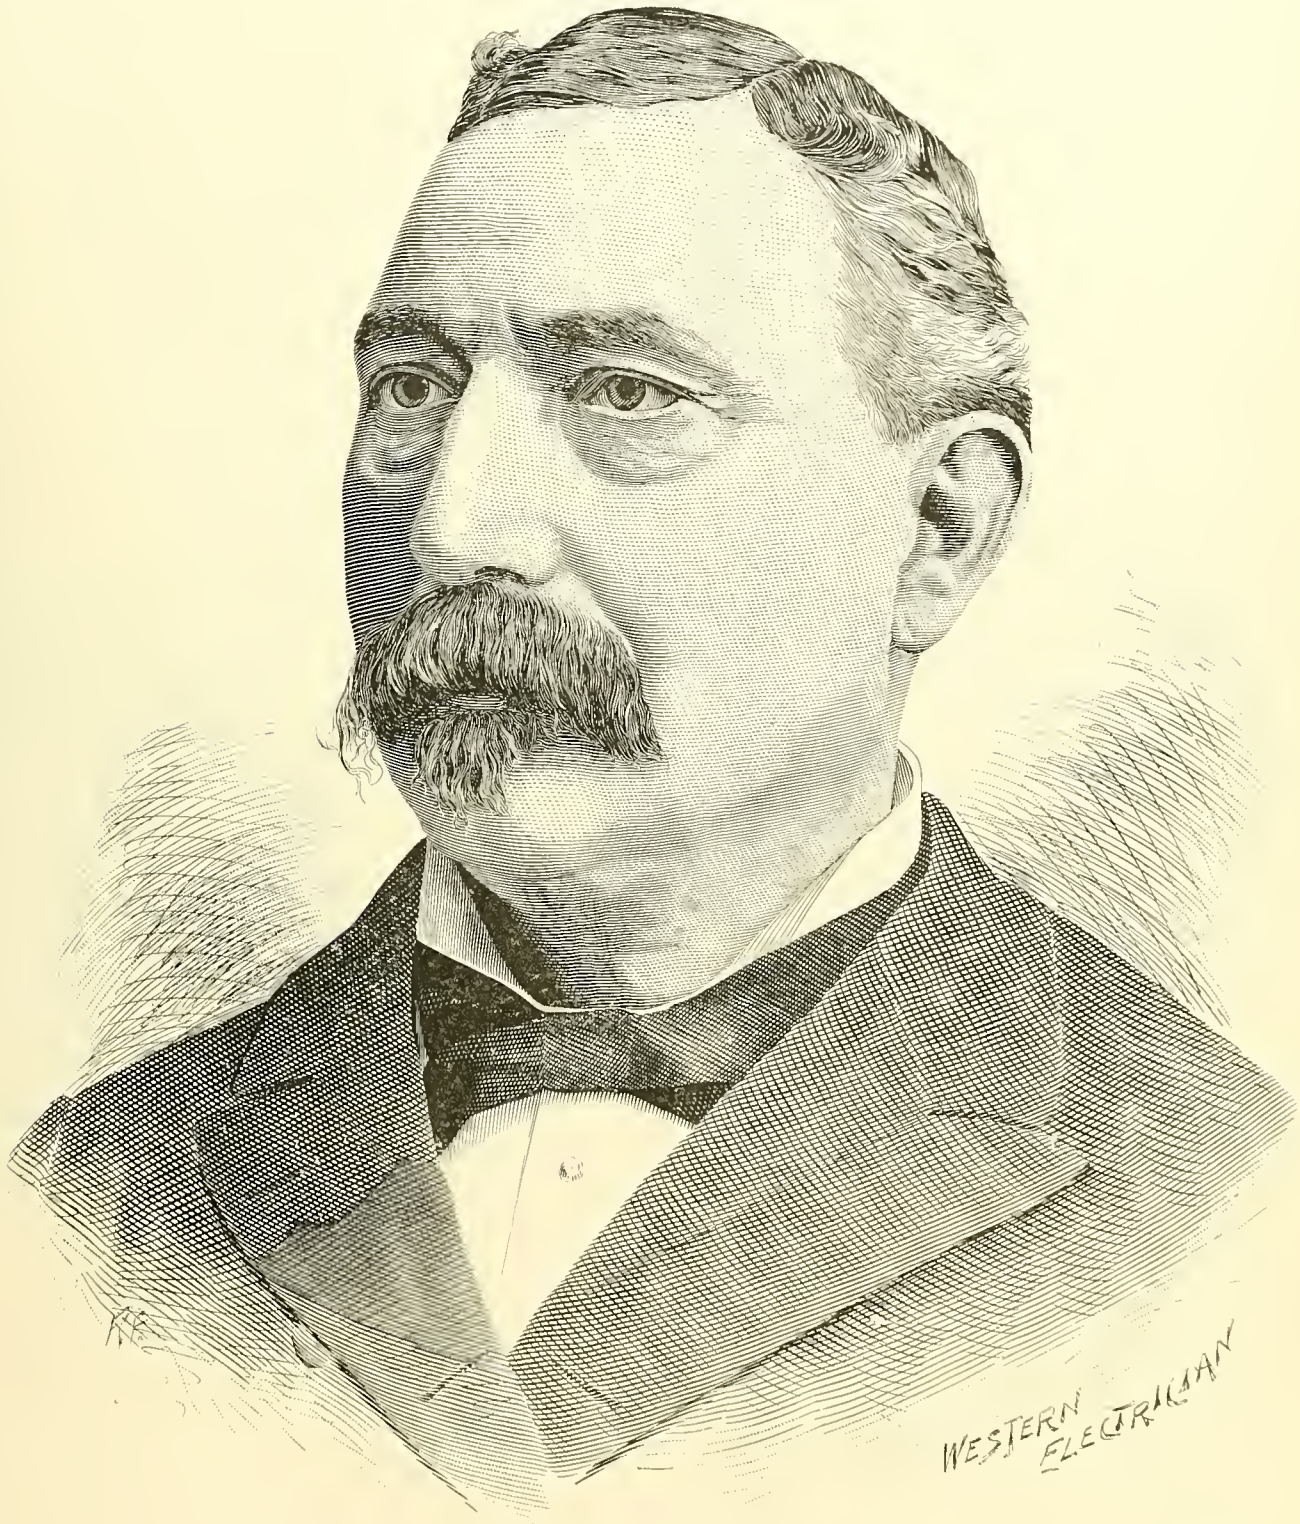
Western Electrician.

EVERY SATURDAY.

Vol. XII. CHICAGO, MAY 6, 1893. No. 18



JOHN P. BARRETT,

CHIEF OF THE DEPARTMENT OF ELECTRICITY, WORLD'S COLUMBIAN EXPOSITION.

Department of Electricity, World's Columbian Exposition.

By J. Allan Hornsby.

The jurisdiction of the department of electricity extends over and covers nearly every exhibit and exhibition building on the grounds of the exposition, for manufacturers have taken advantage of a rule of the exposition which allows the listing for competition of all exhibits, whether the same be exhibited in the building provided for it or not, as is the case in many instances. Therefore the electric fountains, the intramural railway, the great search lights which will be scattered over the grounds, the entire arc and incandescent systems of lighting on the grounds and in the buildings, the various electric motors used for power everywhere, and last but not least, the electrical part of the great power plant, are all intended as exhibits of Professor Barrett's department.

The personnel of the department is as follows: Prof. J. P. Barrett, chief; J. Allan Hornsby, assistant chief; Willis Hawley, assistant; William Wilson Primm, engineer; J. W. Blaisdell, inspector of service; George R. Chambers, chief installation assistant, and Frank Sullivan, assistant.

The department was organized in February, 1891, and since that time has been actively engaged in the work of getting together an exhibit which will be thoroughly representative of the electrical industry not only in this country but of the entire world.

The power plant is fully described elsewhere in this issue, so that this article will merely cover the electrical building proper and the exhibits which may be found therein.

Electric power and a portion of the light is furnished from the power plant through the subway which leads from machinery hall to electricity building. The wires for this service are all now in place, and, though to an unpracticed eye there is seemingly much confusion and an apparent confosed mass of wires, in reality there is the most perfect order and system. Each individual or company has a certain well defined pathway allotted, and it is followed strictly.

Leaving the mouth of the subway under the southwest corner of the electricity building the wires lead directly by the nearest route, following the aisles, to the space of the exhibitor to whom they belong.

By amicable agreement between the department and the exhibitors all systems of both arc and incandescent lighting will be shown, affording the best possible chance for comparison, and as a result making the building the best lighted on the grounds.

There will be 436 arc lights to illuminate the ground floor and gallery, distributed as follows:

GROUND FLOOR.

German Government	27
Brush Electric company	15
Fort Wayne Electric company	7
Western Electric company	27
Excelsior Electric company	22
General Electric company	105
All night Service Lights	14

GALLERY.

Fort Wayne Electric company	69
Brush Electric company	62
Western Electric company	48
German Government	28
All Night Service Lights	12

On the ground floor and in the galleries the lights follow the middle of the aisles and are placed twenty-five feet apart, and in addition there is a light on each truss. All lights are hung eighteen feet from the floors. Arc lights on handsome posts will be set around the edges of all the blocks in the great central nave. In the gallery a light is hung on each alternate truss and on each girder throughout the building in every aisle, giving a light every twenty-three feet and hung so that the arcs come 13 feet above the floor. The General Electric, Brush, Western Electric and Excelsior companies have their generators in Machinery Hall in the power plant, while the Fort Wayne company has established a central station in its space in the Electricity Building, where the generators are driven by motors. All these companies with the exception of the Excelsior furnish incandescent lights for their own use and for the use of other exhibitors, as well as power for the same purposes. In addition the Commercial Electric company and the Jenney Motor company contribute to this service.

The Westinghouse company will not be engaged in this particular service but will furnish some decorative effects which will be unique and startling.

A tour of the building shows that nearly all the exhibitors are present and are getting their displays in shape, while advices in the office show that the others have made ample preparations to be on hand in time. The diagrams presented herewith of the two floors of the building show that every foot of space has been assigned and shows the position of each exhibitor. In round numbers there was available 200,000 square feet of space available for exhibitors, of which France received 21,000; Germany, 23,000; Spain, 1,000; Austria, 1,000; England, 6,000; Italy, 1,000; Canada, 5 0, and the Principality of Monaco 1,000, American exhibitors taking the remainder.

Entering the building from the southeast entrance the display of the C. & C. Motor company is the first to attract the eye. The display will consist of all styles of motors, shown in operation, from the largest size to the smallest. Next comes the display of the Western Electric company; a beautiful temple of Egyptian design with decorative effects of concea'ed incandescent light is the principal feature. Inside, sunk into the walls, are show cases showing all kinds of electric appliances. These cases, lined as they are with dark crimson silk plush, give an exceedingly rich effect to the interior. The walls of this temple are decorated with the characteristic angular figures of Egyptian art except that the people shown thereon are engaged in extremely modern electrical pursuits. Back of this is shown a magnificent switch board of Tennessee marble with gold plated trimmings. Adjoining is a column of light made up of colored incandescent lights, while above all will extend a gigantic streak of lightning, forty feet long, made up of innumerable small incandescent lights which will be made to flash at intervals by a special mechanism. A model theater with novel effects in lighting will also be shown. A special feature of the exhibit will be the making of telephones. Two of the blocks of the Westinghouse company come next, in which there will be a characteristic display of the new stopper lamp and appliances. To the right will be found the Eddy Electric Manufacturing company with a full line of motors run from the Eddy generators in the power plant. Across the nave is the German government's ground floor display. It will unquestionably be one of the finest exhibitions ever shown. The decorations of the whole are superb. From the central nave it will appear as a palace of modern architecture, the whole being wrought out in staff and decorated with bunting, flags and electric lights. In this section the best displays of machinery will be made by Siemens & Halske, the Allgemeine Elektricitaets Gesellschaft and Schuckert & Co. of Nuremberg. Siemens & Halske have in Machinery Hall a combined engine and dynamo of the polyphase type of 1 200 horse power, which will furnish current for the German section. It will be remembered that it was the Allgemeine Elektricitaets Gesellschaft which created a furore at the Frankfort Exposition by bringing power from the falls at Lauffen to the exposition, a distance of one hundred and twenty-five miles. Schuckert & Co. will make a magnificent display of search lights.

The Electric Forging company, of Boston, will make a fine display of their method of drop-forging electrically heated metal, and will show some surprising results. Adjoining these are the dynamo belt displays of Charles A.

Schieren & Co., Munson Belting company and Page Belting company. The Schieren display is a booth made entirely of link leather belting arranged in an artistic manner to form a structure. The Belknap Motor company shows every conceivable application of the motor, from the homely coffee mill to motors of a size suitable for factory work of all kinds. Against the east wall comes the General Incandescent Arc Light company with a display of arc lights for home use to run on incandescent circuits, and next to it E. S. Greely & Co. with a display shown in a gold and white structure. In the northeast bay will be found the Curtis Electric Manufacturing company, the Jewell Belting company, the Chicago Belting company, the Commercial Electric company, the Union Electric company, and the Zucker & Leavitt Chemical company. The central block of this bay will be occupied by the Railway Equipment company of Chicago, which will show, among other novelties, an electric oven in which pies, biscuits, bread and cakes will be baked in plain view of visitors. It is worthy of note that this company filed the first application for space in the exposition, its installation number being one and its department number one. Going west, Queen & Co.'s display of fine testing instruments is next seen, arranged in handsome cases and giving a pretty effect in brass and dark wood.

In the French section, which comes next, will be found many objects of interest. The Societe Gramme will show dynamos of all types, among others the first dynamo with the ring type of armature built by M. Gramme, arc lights for lighthouse use, including one of 200,000 candle power. In general the display in the French section will be of a very artistic nature and will be more or less of a lighter character than that shown in the German division. Fine testing instruments and exhibits of a like character will be more liberally shown than electrical apparatus of a heavier kind. The government display of telegraph apparatus and meteorological instruments with electrical recording apparatus will be arranged as a weather bureau station, the recording apparatus being in the display while the observation apparatus will be installed in one of the towers of the building.

The exhibit made by Great Britain is somewhat of a disappointment, atoned somewhat by the display made by the postoffice department, which controls the telegraph. This exhibit will be of great interest, owing to its historical value.

In this section of the building will be found the exhibits of Canada and Russia.

L. G. Wing & Co., the Electrical Conduit company of New York, and the Elektron company are in this neighborhood. The Conduit company will show a magnificent set of cast iron conduits and manholes, and it is of interest to know that it was the first exhibit to be completely installed and set up, it having been ready for more than six weeks.

The Elektron company will have a passenger elevator in operation which will take visitors free of charge to the second floor.

The Standard Electric company of Chicago will make a fine exhibit of their arc lighting dynamo, the special feature of which is the ventilated armature. This will be an exhibit to be avoided by people with weak eyes, as sixty arc lights will be grouped together in attractive shape and will all be in operation at one time.

The Thomson Welding company will make an interesting display of welding machines, with specimens of their work, and show the machines in actual operation.

Dr. Hirsch will show the production of aluminum by electrolytic action; also its use with alloys as a substitute for steel.

The Mather Electric company has begun installation and will have a fine exhibit of power generators.

The Fort Wayne Electric company shows a complete central station operated by motor power. Two motors of eighty and 40 horse power each operate a line of shafting, which in turn drives two light arc dynamos and two incandescent dynamos, one of which is the new type of alternator of 1,500 lights capacity and of a size so small that it will excite the admiration of engineers and mechanics. The switch board designed by E. A. Barnes, who has the exhibit in charge, will be a handsome feature of this exhibit.

The Brush company will show a pavilion with a circular interior dome beautifully lighted with incandescent lamps.

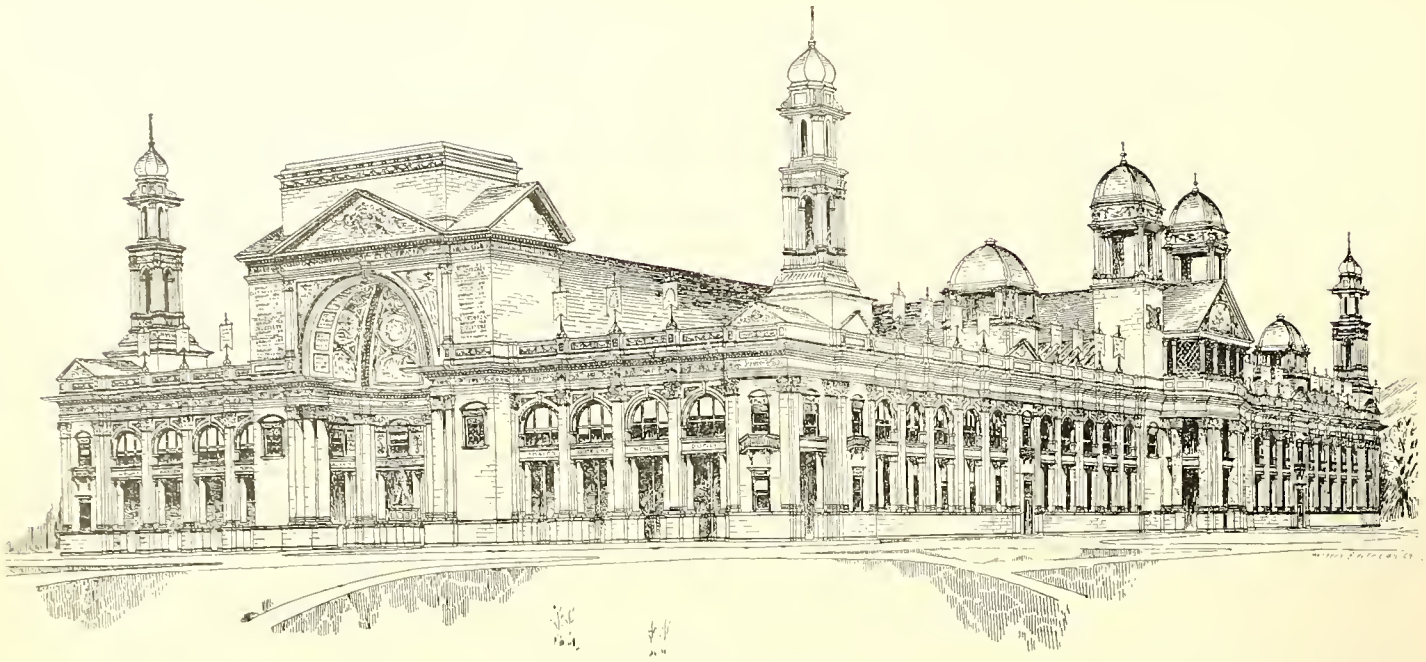
Hanson & Van Winkle will show a line of dynamos for electro-plating, also some historical apparatus loaned by the city of Birmingham, England.

The Jenney Electric Motor company will have a central station operated by direct coupled generators and motors by which they will light their section of the building.

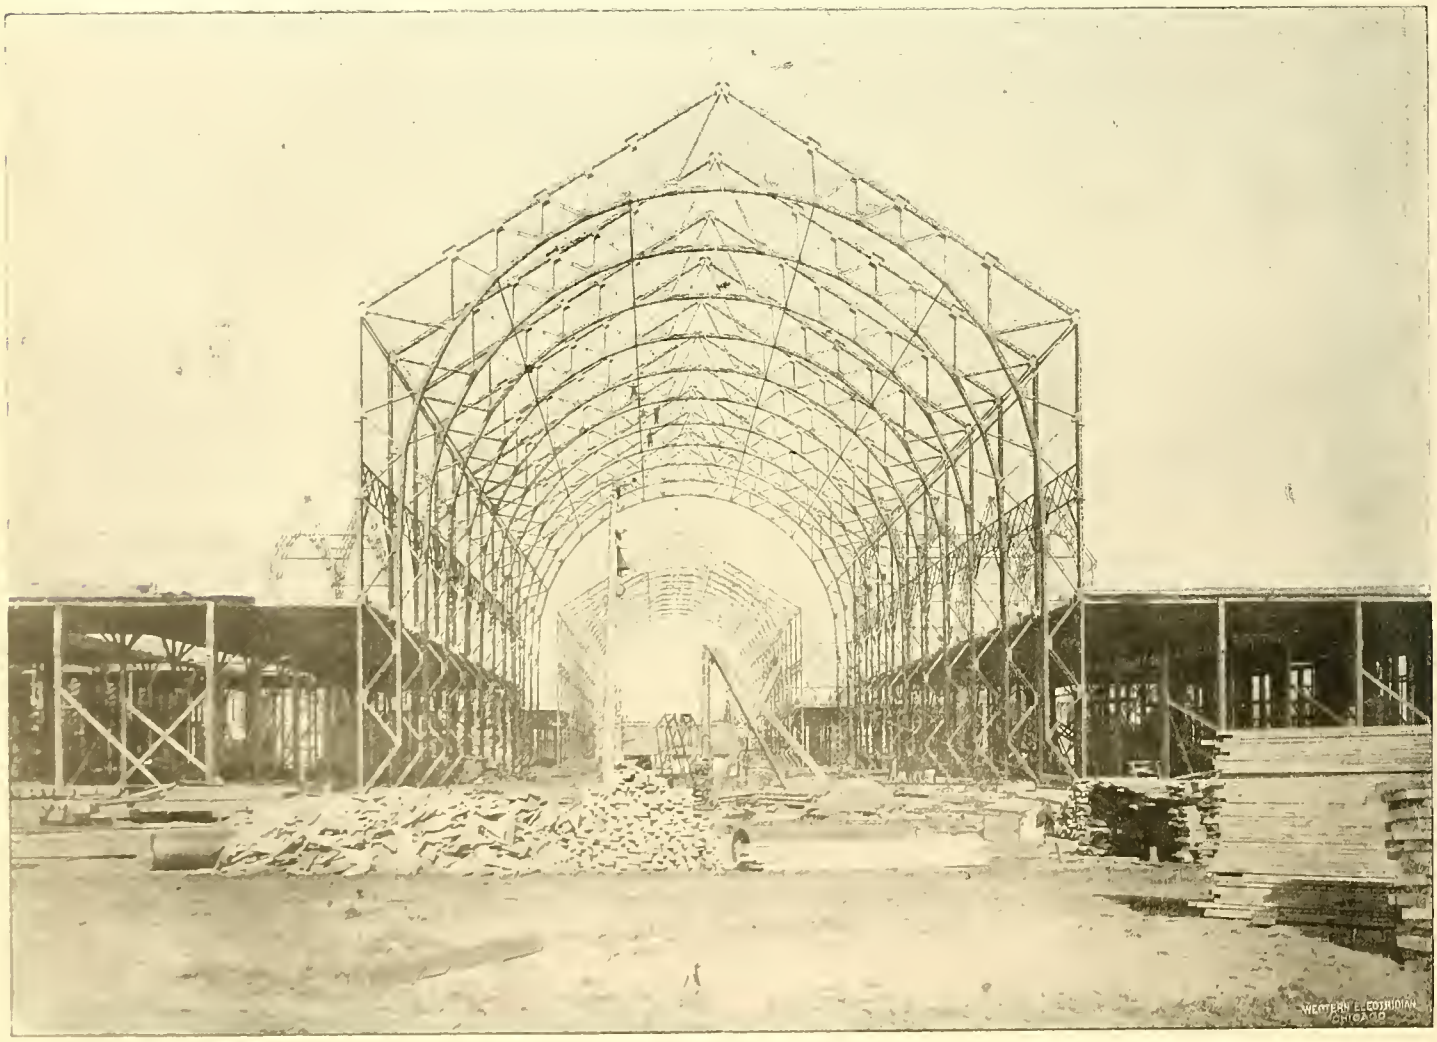
Going farther north and down the central aisle the displays which are most prominent are those of the American Bell Telephone company and the Westinghouse company. The telephone booth is an example of the purest type of Greek architecture throughout, and the exterior and interior decoration follow this idea to the minutest detail. In it will be shown the telephone from its infancy to the present day, including a model central station. A small theatorium will give an opportunity to test the loud-speaking telephone in connection with the long-distance circuit from Boston. Concerts in New York and Boston will thus be heard in the electricity building.

The Westinghouse company will show railway appliances of all kinds, as well as the alternating apparatus of the company. A feature will be the display of mining apparatus with a generator operated by a Pelton water-wheel. An electric pump operated by a motor will furnish water to the wheel, which will in turn operate the generator. It will be an unique exhibition of the possibilities of the use of electricity. In section J a magnificent

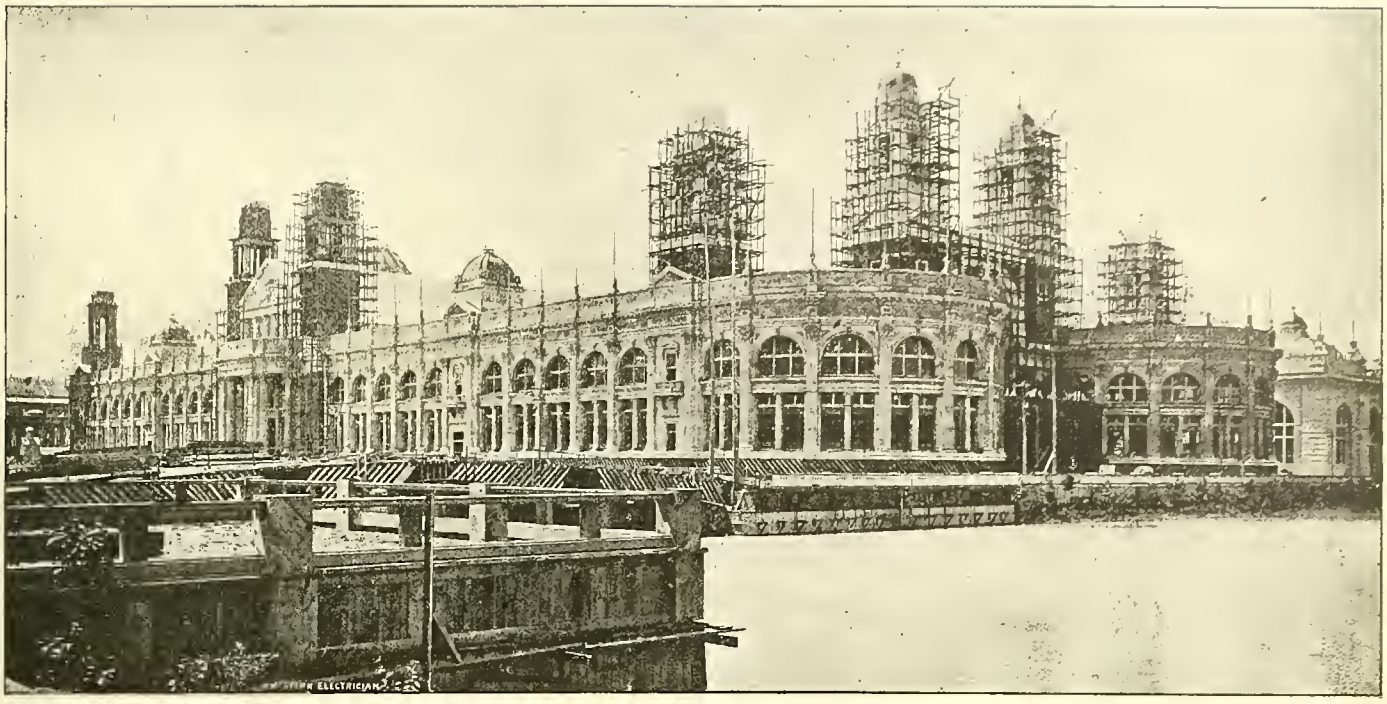
MACHINERY HALL.



SKETCH OF ELECTRICITY BUILDING.
(Western Electrician, May 9, 1891.)



ELECTRICITY BUILDING IN COURSE OF CONSTRUCTION.
(Western Electrician, February 9, 1894.)



ELECTRICITY BUILDING BEFORE THE DEDICATORY EXERCISES.
(WESTERN ELECTRICIAN, September 3, 1892.)

ELECTRICITY BUILDING COMPLETED.

structure will be erected which will be dazzling with its myriad display of incandescent lights. It will reach a height of forty feet and will be a notable object in the central nave.

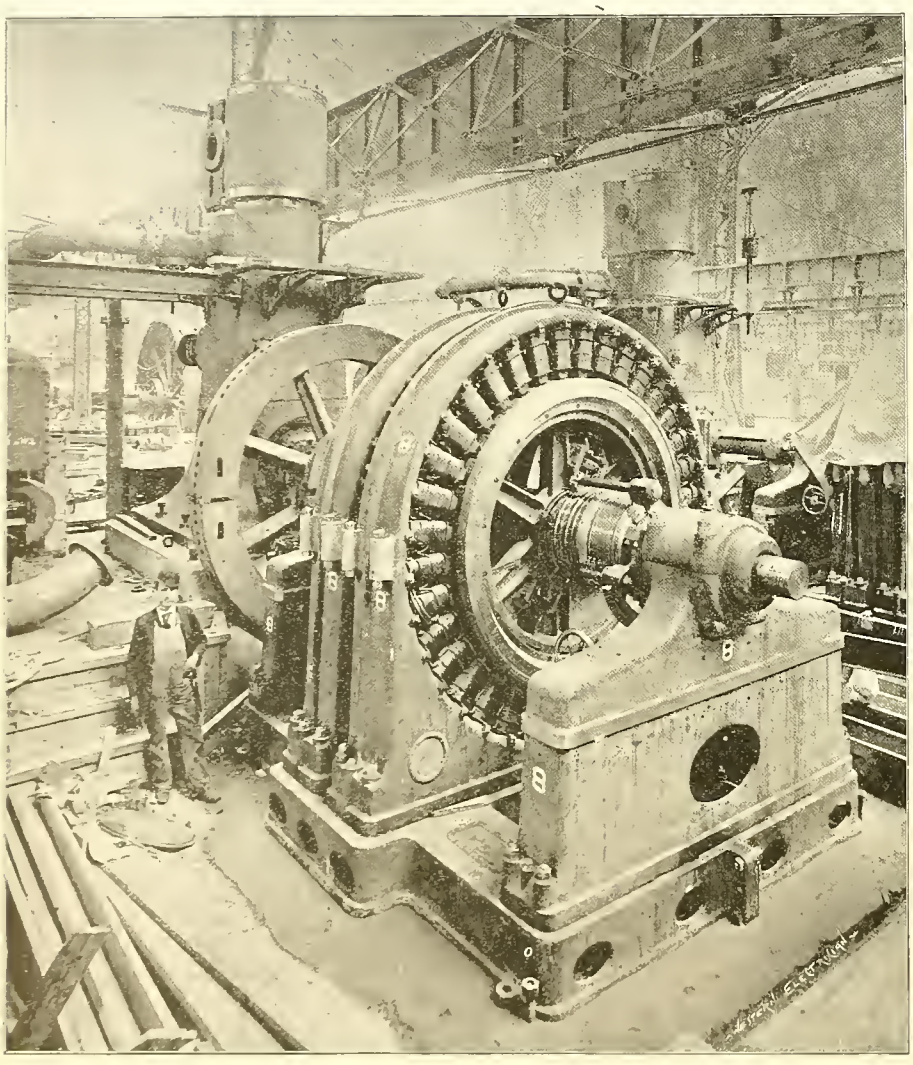
The gallery floor will have a great number of exhibitors, all of whom will make more or less interesting displays. Of the foreign governments, Germany will again take the lead. The northeast part of the gallery will be filled with exhibits of a light character. In the east central nave will be the historical display magnificently decorated. It will be the history of Dr. von Siemens for, as Dr. Lobach remarked, "the history of Von Siemens is the history of electricity in Germany." Another interesting exhibit is the "Schnellsehr" or "Tachyscope" of Berliner. It is the twin brother of Edison's Kinetoscope, but Edison goes a step farther and adds the phonograph, giving us the Kinetograph.

Spain will show the operation of its military telegraph. Italy will make a small but valuable exhibit, as will also Great Eastern, thus showing the inception and progress of the Atlantic cable.

Elisha Gray will show his telautograph, which has already been described fully in these columns. N. L. Holmes shows an electric dining-room service, thus doing away with the dining-room waiter. W. R. Brixey has a handsome display in white and gold, one of the prettiest pieces of work in the gallery. Dr. A. H. Phelps will show a new process of engraving on glass by electricity, something new in that line and completely revolutionizing the old methods of doing such work.

The Republic of Brazil is the only South American republic represented in the electricity building, and it will make an interesting exhibit of government telegraph.

The outside displays, the electric fountain, the intramural railway and the electric launches form part of the electrical exhibition at the fair, but they need no special mention here, as they are described elsewhere. Only one outside display needs notice and that is the exhibit of



DIRECTLY CONNECTED WESTINGHOUSE 1,000 HORSE POWER ENGINE AND 10,000 LIGHT ALTERNATOR, MACHINERY HALL.

Austria and New South Wales. Among other displays on this floor may be mentioned those of the Western Union Telegraph company, the Commercial Cable company, W. R. Brixey, the Chicago Electric Wire company of Wilmington, Del., Dr. A. H. Phelps, N. L. Holmes, McIntosh Battery & Optical company and the North American Phonograph company. The latter will be in a great measure the personal exhibit of Edison. Here will be shown the phonograph, from its inception down to a machine capable of reproducing a grand opera in its entirety.

Edison's latest invention, the kinetograph, will be the feature of the exhibit and probably the sensation of the exhibition, just as the phonograph was at the Paris exposition.

The Commercial Cable company will show the progress and workings of the modern cable, with a model of the cable steamer "Mackay-Bennett." The Western Union Telegraph company's display will be the history of telegraphy from Morse to Edison, showing the original apparatus of Morse of 1837 and 1844 and the latest quadruplex instruments. The Field collection of maps, data and apparatus will be shown as well as a model of the Schnuckert & Co. of Nuremburg, of search lights. One of these, a six-foot projector, will be on the manufactures building. It has an actual candle power of 60,000, and this light is condensed into a beam which will have a candle power of 180,000,000. This light could, if placed at a sufficient altitude, illuminate Milwaukee so brightly that the finest print could be read on the darkest night.

Taken as a whole, electricity building will be probably the center of attraction, especially at night, and the exhibits therein will be found to be thoroughly representative of the industry and will illustrate the progress of the science in a way that will leave nothing to be desired.

The Boston & Montana Consolidated Copper & Silver Mining company of Great Falls, Mont., has recently put in operation its large electrolytic copper refinery. This plant is capable of turning out 1,200,000 pounds of pure electrolytic copper per month. The current used is generated by two multipolar Thomson-Houston dynamos of 165 kilowats capacity, and is transmitted from the power house to the tank room, a distance of 2,100 feet, through 21 half-inch copper wires. The total weight of copper connections used in the plant is over 55,000 pounds. The total cost of the plant, aside from real estate, etc., was over $350,000.

The Service Plant.

By R. H. Pierce.

The electrical service at the World's Columbian Exposition will form a working exhibit of every branch of the art in commercial use, and will be of great interest as representing what is newest and best in every branch, and at the same time showing, as has never been done before, the enormous resources of the electrical industries of this country. The whole service comprises complete installations of the following named systems:

Arc lighting.
Incandescent lighting.
Electric power.
Telephone service.
Police signal service.
Fire alarm service.
Telegraph service.
Electric transportation.

In addition there will be many minor and new applications of electricity. The reader will find elsewhere in this paper articles descriptive of the principal applications written by those who are familiar with all the details, and the writer will only attempt, briefly, to attract attention to the magnitude of the installation.

A fair idea of this may be obtained by a comparison with other expositions. At Paris in 1889 the total steam power devoted to electric lighting was 3,000 horse power. At Chicago the engines devoted to electric light and power in the main power plant alone aggregate 17,000 horse power, of which 3,000 horse power is devoted to the electrical transmission of power and 14,000 horse power to producing electric light. About 1,000 horse power in addition will be supplied for light by exhibitors in machinery hall and in small isolated plants. To this must be added, if the comparison is to be complete, the plant of the Intramural Railway company of about 5,000 horse power.

The electric lighting at the last Paris exposition was furnished by 1,150 arc and 10,000 incandescent lamps, giving a total of about 1,600,000 candle power. The lighting at Chicago will comprise about 90,000 incandescent lights of 16 candle power, or a total of 1,440,000 candle power, and about 5,100 arc lamps, with a total of 10,000,000 candle power—a grand total of about 11,400,000 candle power. The figures are not exact, as the demand for light is constantly increasing.

The total capacity of the electric plant is about 5,000 arcs of 2,000 candle power each and 120,000 incandescent lights of 16 candle power, so that there is a reserve sufficient to operate 30,000 incandescent or 3,000 arc lamps. It appears, then, that the plant is approximately between seven and eight times the size of all the plants at Paris. It is significant that while the lighting alone at Paris called for the formation of a syndicate of nearly all the leading companies—over twenty in all—the lighting at Chicago, with the exception of about 500 horse power, will be furnished from the standard apparatus of four leading American firms.

The most noticeable feature, and the one which especially shows the progress of the art, is the fact that here for the first time electricity is used almost exclusively for transmission of power. With the exception of power in machinery hall and a small proportion of the power in the mines and mining building, all the power which is transmitted will be furnished from the great power plant through wires and utilized by electric motors. Even in machinery hall lines of shafting will be driven by electric power. Already seventy five motors aggregating 1,300 horse power are placed or being placed for the use of the Exposition company alone, and electric power can be obtained by exhibitors in all buildings.

While the subject of electric power transmission is under consideration it may not be out of place to call attention to the service of electricity in building the exposition. From the very beginning of construction the temporary power plant, now no more, ran day and night seven days in the week, operating motors in the daytime which furnished power for the saw-mills, hoists, pumps and painting machines, and at night grinding out light, so that the construction could be carried on day and night where necessary, and the engineers and draughtsmen could lay out work for other days and nights. Electricity helped to prepare the material, to hoist the heavy beams and trusses, to paint the buildings, and at the same time to prolong the labors of the overworked engineer and mechanic and light the rough or muddy pathway of the Columbian Guard.

A few words must be devoted to a description of the arc lighting plant. But few arc lights will be sold, the entire

capacity of the arc machines being needed for general illumination. Of the 5,000 lamps used for this purpose about 1,600 will be used for illuminating the grounds, and of the other 3,400 nearly all will be used for lighting the main aisles of the exhibit buildings. The lights upon the grounds are hung upon fancy iron posts of special design, one single lamp upon each post, except at entrances and conspicuous points, where two and three light clusters are used. The lights are placed on roadways at distances varying from 75 to 100 feet, according to location, and so as to form straight lines in all cases. The lights about the buildings are all about 40 feet from the structure, where the streets allow this arrangement, thus forming an even lighting of both streets and buildings.

The larger buildings are lighted according to the plan shown in the following table:

NAME OF BUILDING.	NO. OF ARC LAMPS.	SYSTEM EMPLOYED.
Manufactures	1,200	Thomson-Houston.
Agriculture	500	Standard.
Transportation	350	Western Electric.
Horticulture	250	Wood.
Mines and Mining	200	Brush.
Fisheries	50	
Illinois State	77	
Machinery Hall	250	Mostly Standard.

Machinery hall annex will be lighted by 160 lamps of the General Incandescent Arc Light company, which will be run in series of ten from the power (500 volt) circuits. The terminal station and tracks will be lighted by arc lamps of 3, 6 and 9 amperes in series on the 440 volt circuit of the Siemens & Halske company of Berlin. Transportation annex will have 150 Helios arc lamps attached to the 105 volt alternating circuit of the Westinghouse company.

The arc lights in buildings will for the most part be suspended by steel wires from the roof, the lamps being hung on insulating hangers at such a height that they can be reached by trimmers from step-ladders. This arrangement has proved very satisfactory, as it does away completely with slack wires and forms a neat construction which is cheap to erect and easy to maintain. The aisle lights in machinery hall are suspended higher than elsewhere, so that they clear the electric cranes, from which they are trimmed. In special cases where the lamps are hung very high and in inaccessible places a special separable hanger will be used, so that the lamps can be lowered and raised without the use of slack wires.

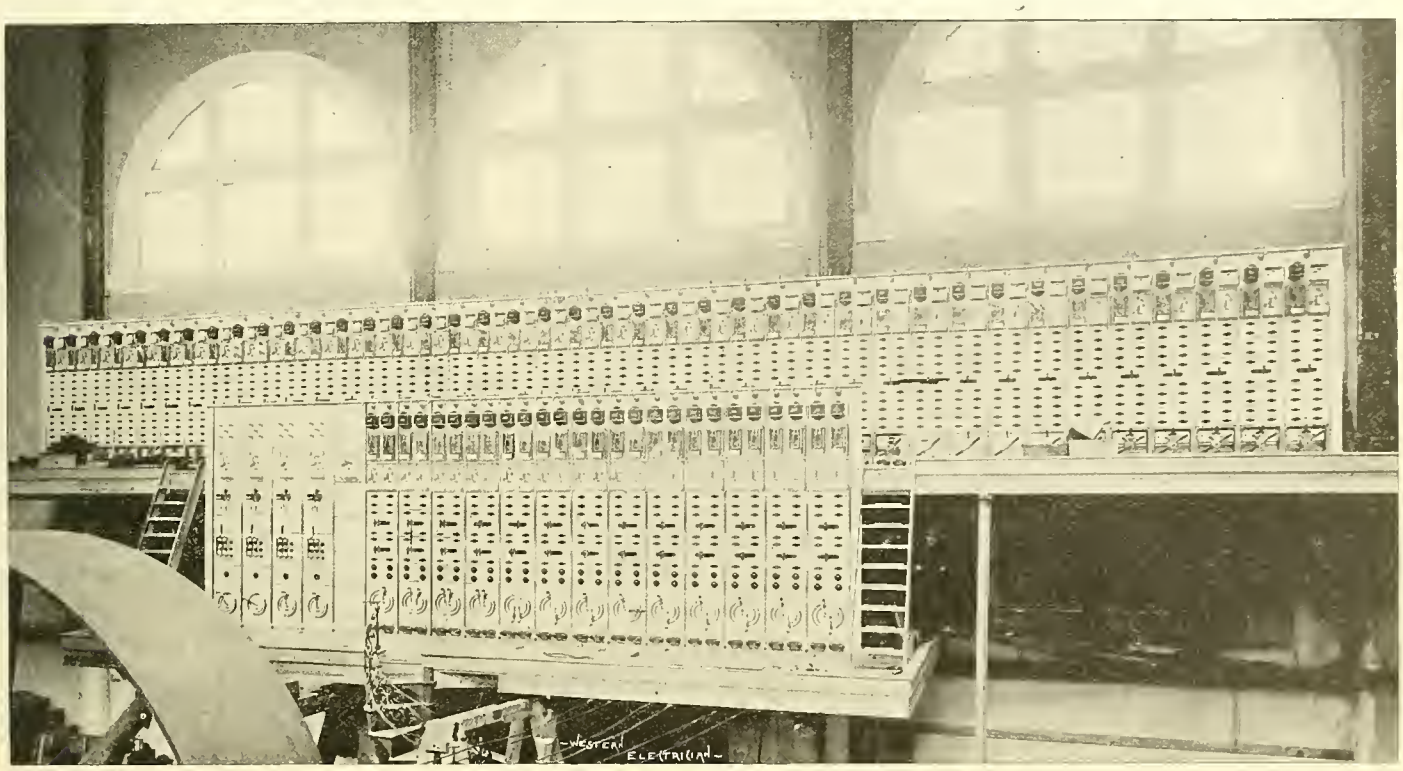
The crowning glory of the arc lighting is the lighting of the central nave in manufactures building. This is undoubtedly the most unique and beautiful piece of arc lighting ever attempted. This space, which is about 1,300 feet long and 368 feet wide, with a height of 202 feet in the clear, is lighted by five great coronas. These coronas are suspended 140 feet from the floor. The central corona is 75 feet in diameter and carries 102 lights; the other four, which are equally distributed along the main longitudinal axis, are 60 feet in diameter and carry 78 lights each, making a total of 414 two thousand candle power lights. The lamps are hung in two concentric circles. Although the coronas are in reality hanging galleries in which the lamp trimmer can walk at ease, they look light and graceful at the great height at which they are suspended, and the ladders by which they are reached from the great trusses would not be noticed by the ordinary observer. The effect of the lighting is fine beyond expectation. Opal globes are used on the lamps, as upon all the arc lamps in the great plant. These diffuse the light, and with the great spread of the coronas and the reflection from the arched roof the lighting is so uniform that the eye cannot distinguish any variation of intensity upon the floor or the exhibit pavilions.

The arc plant proper consists of five independent plants, each having its own switch-board. From the switchboards, which stand out upon the floor in their respective plants, the circuits run under the floor to a long gallery under a main aisle in machinery hall and annex. This gallery is an extension of the main electrical subway. From here they run to the principal buildings in the main subway, which is a tunnel about 7 feet high and varying in width from 4 to 16 feet. In the main subway the arc wires as well as all other conductors are carried upon petticoat insulators on oak cross-arms, so that we have in reality an underground pole line buried where it is safe from storms and falling trees and wires and where the lineman can stand upon the ground and reach any of the 300 conductors.

Leading west from the main gallery a trunk line of tile ducts leads to the outside of machinery hall and is continued by wooden ducts to the north, feeding the western half of the park. A network of ducts connects the trunk line of duct to the subway and runs to all outside lights. The power circuits run underground only in the subway. An idea of the power circuits may be obtained from the fact that they comprise over 35 miles of No. 0000 wire, beside miles of smaller sizes. The arc system comprises 90 miles of wire in the 75 miles of ducts, 50 miles of wire in the main subway, 130 miles of wire in buildings and overhead on structures. Although the smallest arc machine is a 50 lighter, there are 100 arc dynamos and an equal number of circuits.

Such in brief is the plant at Jackson Park. Although it is not the "ideal central station" of which we hear so much, it will prove an ideal exhibit of the resources of American engineering and the progress in electrical engineering.

Plans have been completed for a power station at the outlet of Huella Lake, in Sweden, where there is a large water power. At present four turbines, each of 100 horse power, will be put in, one of them to be held in reserve, in case of a break-down. The power will be transmitted by overhead wires to Grangesberg. The electric lighting station is six miles, and the station from which power will be distributed is eight miles, from the dynamo house.



WESTINGHOUSE SWITCHBOARD, MACHINERY HALL.

Edison Company's Strike Still On.

The aspect of the strike of the Chicago Edison company's wiremen has not changed materially in the last two weeks. Thirty per cent. of the total number of wiremen employed by the company have not returned, and electric installations on several buildings in process of construction have been abandoned for the present as a consequence. The company maintains, however, that it is not at all troubled by the strike and that it will fill existing contracts without delay. Last Thursday night a number of electrical contractors met at the Grand Pacific Hotel and formed an association to be called the Electrical Contractors' Association of Chicago. The officers are: President, W. L. Abbott; vice-president, W. S. Cornish; secretary and treasurer, T. J. Thompson, who, with L. K. Comstock and F. S. Gorton form the board of directors. It is the intention of this association, which at present includes about 30 electrical contractors, to set the specifications for wiring, etc., so high that all contractors in the city will be induced to join. It is claimed that the new association agrees to pay the rate of 37½ cents an hour, asked for by the men, and to make eight hours a working day.

No mention was made to working with non-union men, and whether the men will accept this proposition is a matter of serious question. The striking union has presented its claims before the Building Trades Council, with which it is affiliated, and this body has indorsed them. As the striking men practically refuse to work with non-union men, more serious trouble may result before an amicable settlement is finally made.

Van Depoele's Railway Patents.

The General Electric company announces that "after several years of contention and interference before the Patent Office, two broad fundamental patents have been granted to Chas. J. Van Depoele, covering all the essential features of the trolley. The patent is assigned to the Thomson-Houston Electric company. In detail, the claims allowed cover first, the underneath contact made either by a rolling wheel or a sliding spoon contact piece; secondly, the converse of these two cases, and thirdly, the reversibility of the trolley pole on top of the car enabling the contact to be made on either side of the trolley, as the case may be. The possession of this patent practically means, the entire control of the overhead system throughout the United States. This so far is the only system which has proved successful, no serious rivalry having yet been shown, by either the storage battery or the underground conduit. The acknowledgment of the claims, under this patent granted to the dead inventor, made by the Patent Office is an important victory for the General Electric company, which will most likely be followed by very important results to the entire street railway fraternity."

Exhibitors In Electricity Building.

Following is a complete list of American exhibitors in electricity building, taken from the official record, showing the location assigned each display:

A	7	Acme Filter company, St. Louis, Mo.
G	1	American Bell Telephone company, Boston, Mass.
S	14	American Graphaphone company, Washington, D. C.
T	9a	American Battery company, Chicago.
H	2	American Engine company, Bound Brook, N. J.
Z	1	American Electric Heating company, Boston, Mass
Z	1	Ansonia Electric company, Chicago.
M	1-2	Anthony Electrical Instrument company, Chicago.
Y	43	Bates Manufacturing company, Chicago.
		Baxter Electric Motor company, Baltimore, Md.
E	2	Belknap Motor company, Portland, Me.
H	2	Bemis Car Box company, Springfield, Mass.
	7a	Billings & Spencer company, Hartford, Conn.
F	7	Curtis Electric Manufacturing company, Jersey City, N. J.
T	3	Cutter, George, Chicago.
L	5	Degenhardt, F. E., Chicago.

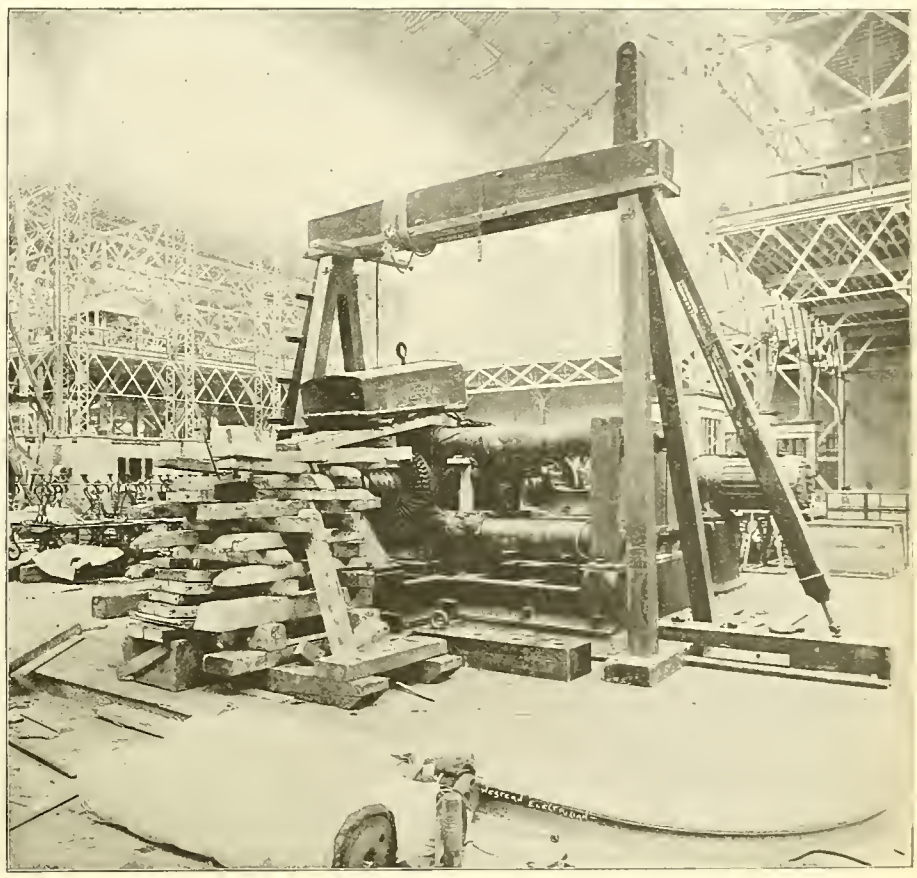
Model Incandescent Lighting Plant.

By E. E. Keller.

The important work of providing a complete installation for the incandescent electric lighting for the entire exposition, as well as a good share of the arc lighting and the electric power service, was placed in excellent hands when the contract for this work was made with the Westinghouse Electric & Manufacturing company. The contracts have been carried out to the letter; many details and refinements having been added beyond what was called for, and the entire plant, including everything from the lamps to the engines, has been designed and built in the most thorough manner conceivable, in view of the short time available for completing the work.

On June 8, 1892, a contract was drawn up for this immense incandescent lighting plant. This contract, however, was not signed and completed until the latter part of June, when active preparations were begun at once. Since that time, all plans have been made, including entirely new designs for the dynamos, and the whole of this colossal work completed.



PUTTING "JUMBO" TOGETHER, ELECTRICITY BUILDING.

Work was started at once, upon the completion of the contract by designing a suitable system of underground conduits and converter pits etc. On July 1st the conduits and manholes were laid in the surroundings of the woman's building, which was then practically complete, and the grounds surrounding it ready for the landscape gardener. The contract called for the completion of all underground work by September 1st, and this was practically accomplished by the New York Insulated Wire company, to which the Westinghouse company had awarded a sub-contract for all the construction work outside of the central station in machinery hall. The vast work of wiring the large buildings was taken up as fast as they reached a sufficiently advanced stage to work in them to advantage. In many cases, however, this could not be done, owing to the fact that the nature and location of the lighting was not decided upon by the exposition, and, in the case of purely exhibit buildings, the wiring could not be begun until exhibitors had decided what lighting they wanted. This naturally caused vexatious delays; the first plans for the lighting of exhibit spaces not being received until the last week in March. At this time the wiring for about 50,000 incandescent lights had been practically completed, so that the work of wiring for exhibits could be pushed rapidly forward, although it was an utter impossibility to complete everything, as applications are even now coming in, and exhibitors will probably order lights and changes for some weeks to come. It is notable that, although the wiring is only to be used for six months, it is all done so thoroughly that one will be unable to find very many installations in America that will compare favorably with it. The form of construction adhered to throughout is of the very best.

All lighting is controlled from closets located at convenient points in the buildings, where most of the switches and all of the fusible cut-outs are placed. The wiring was so planned that not more than twelve lamps are dependent upon one cut-out, and, where it was possible, the circuits were so arranged that only part of the lights in any one location would be affected in case of trouble. All wires, no matter where located, can be reached without any delay, as the running of wires in inaccessible places was strictly avoided. In all cases the wires are led to and from the cut-out closets in mouldings or iron pipe, excepting in places where they could be run on glass insulators through roomy spaces in the hollow walls, where a permanent means of access to these hollow spaces was always provided. Where hollow spaces could not be made accessible, or where they were too narrow, iron pipe inside, or wooden mouldings outside the walls were resorted to, over three hundred miles of pipe and mouldings being used for this purpose alone. Where iron pipe was used, both legs of the secondary circuits were invariably run in the same pipe to guard against self-induction. The secondary wiring for the installation has been planned and installed for a drop of three per cent. with a variation of not over two per cent. between any two lamps on the grounds, and the uniformity of the lighting shows how well this was done. In order to avoid the errors that would have occurred had the common method of determining the direction, location and sizes of wires been adhered to, it was made an inviolable rule that no wiring should be erected without a complete detail drawing. In every case, all necessary calculations and drawings were made in the office, giving the foreman all required information, thus securing a uniform construction and a permanent record for future reference in case of trouble. A thorough system of inspection was maintained throughout the work, both on the part of the exposition and the contractors, with the result that remarkably little trouble was encountered after the completion of the wiring.

The primary system of this entire plant is underground, not a single wire being overhead, with the exception of that portion of the grounds located south of machinery hall

and agricultural building, where it was decided to use overhead construction owing to the nature of the buildings and exhibits in this section. In this portion of the grounds, the wires are carried partly on the structure of the electric elevated railroad and partly on a pole line.

The circuits for the main portion of the grounds leave the station by means of lead covered duplex cables of the Standard Underground Cable company, passing through vitrified ducts to a fire-proof room at the side of the main subway located under the floor of machinery hall. Here some of the lead cables end in rubber terminals, and to these are joined Grimshaw wires with 125 mils of rubber insulation going to the eastern portion of the grounds by way of the large subways in which the wires are strung on cross-arms and glass insulators. In this subway, which has been frequently described in the electrical journals, the wires are carried five inches apart to the administration, mines and mining, electricity, manufactures and liberal arts, government and fisheries buildings. From the latter point, the circuits going north to the various state and foreign buildings are again joined to lead-covered duplex cables and carried in wooden conduits. In the circuits going to the western portion of the grounds, lead-covered cables are used throughout, the cables being laid on the floor as the main subway until the north wall of machinery hall annex is reached, when they are carried in wooden ducts composed of pump logs. Wherever the circuits and laterals leave the main subway, a duplex lead covered cable is joined to the rubber covered subway wires and is carried to its destination by means of pump logs, a vitrified pipe being used in cases where buildings are entered. This system of primary wires is connected to special converters of the Westinghouse type, most of which are of thirteen kilowatts capacity, there being some of 6,250 watts and some of 2,000 watts capacity. All of these converters are placed in ventilated pits of special design located at most convenient points. These converter pits are built of wood with a galvanized iron lining so arranged as to exclude moisture and still permit of thorough ventilation. Primary fuse blocks of special design were placed in the pits, there being no fuses in the converters. These primary fuse blocks are designed to also fill the place of a primary switch, so that any or all converters in the pit can be disconnected from the primaries for testing or repairs. The secondary fuses are placed in closets inside of the building. Each converter is connected to a separate secondary circuit, and these circuits are each supplied with a main switch placed in the cut-out closet. Converters are in no case "banked."

Besides the incandescent lighting furnished from this system of primaries, there are over a thousand arc lamps operated in all parts of the grounds from the same wires. The arc lamps used for this work are partly of Westinghouse manufacture and partly of the manufacture of the Helios Electric company of Philadelphia. All of these lamps are operated from what are termed Westinghouse "economy coils," which permit of one, two or three arc lamps being connected across the 105 volt terminals of the secondary system, without resistance coils being required to absorb the current of lamps not burning in the series. These "economy coils" are placed in convenient locations in the buildings. The lamps are designed for fourteen amperes at thirty-five volts pressure.

In several locations it was found necessary to operate motors where the 500 volt power circuits were not available, and in these places two-phase alternating current motors are connected to the system. Where fan motors and other small motors are required, they are simply connected to the secondary lighting circuits, an ordinary alternating current motor being used.

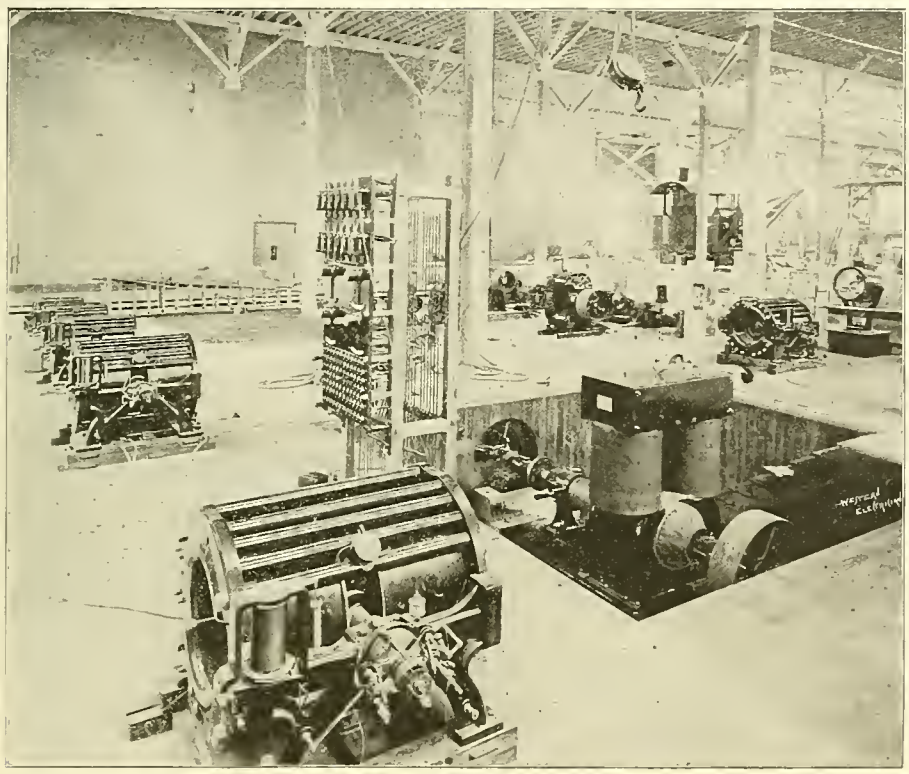
Besides this work, the Westinghouse company furnishes a novel system of lighting for the buoys that have been placed along the shore of Lake Michigan, for a distance of seven miles, from the Chicago river to the main pier at the exposition grounds, by the United States government. For this purpose thirteen spar buoys have been placed at points along the shores to indicate the shoals. Each buoy carries an incandescent lamp of 100 candle power in a wrought iron cage or lantern at the upper end of the spar, the lower end of which is fastened to a heavy cast-iron anchor. The current for each of these lamps is supplied from a small Westinghouse converter, of special design, placed in the upper end of the spar. These converters are connected in series, the current for the entire series being obtained from a special Westinghouse converter of 1,400 volts. This large converter is placed at the outer end of the main pier at Jackson Park, where all necessary switches, fuses, regulating devices and Wurts non-arcing metal lighting arrestors are also placed. For this work a single wire Bishop gutta percha submarine cable is laid from the pier to the first buoy; from there to the second, and so on. From the last buoy at the city the cable returns by the most direct route to the pier at Jackson Park. On the whole, this system of lighting buoys promises to come into extended use for harbors along the seacoast.

The central station supplying current to this entire system of incandescent lighting, arc lighting, and power service is well worth several days' study on the part of any one interested in work of this character. When the contract for this work had been secured, it was at once decided that the scope of the work required something out of the ordinary line of generating apparatus, and plans were made for an entirely new type and size of dynamo. It can be imagined that this called for energetic action on the part of the company's engineers at Pittsburg and the carrying out of the work night and day in the factories. The result of the tireless energy displayed is a station of a very simple and practical character, considering its size. This lighting plant is located in what is known as the power plant, a stretch of space 100 feet wide along the south wall of machinery hall next to the boiler house. There are twelve two-phase alternating current dynamos of a capacity to supply 15,000 50 watt lamps each, and two single phase dynamos of 4,000 lights capacity each, also one 700 horse power 500 volt continuous current generator. Six of the twelve large dynamos are coupled direct to Westinghouse compound engines of 1000 horse power, specially designed and built for this work. The other six dynamos are belted directly to engines of different manufacturers. These dynamos operate at 200 revolutions per minute with a frequency of 7,200 alternations. In the space directly opposite the main entrance of machinery hall and in the center of the south portion, is a space about 100 feet square in which an E. P. Allis company's Reynolds-Corliss quadruple expansion engine of 2,500 horse power drives two large dynamos in tandem. In this same space is a Corliss engine of 1,000 horse power capacity built by Fraser & Chalmers, which drives another of these dynamos. Besides these three large dynamos, there are three direct coupled dynamos of the Westinghouse railway generator type of 100 horse power each, wound for 250 volts, and used as exciters for the entire plant. Here also are the two 4,000 light machines driven by belts from two Westinghouse compound engines of 350 horse power each. In the space next west of this, which is only 42 by 97 feet, are located four of the direct coupled dynamos, showing the remarkable saving in space effected by the use of this type of engine and method of coupling. The engines in this space are of entirely new design, and are among the first high speed engines of this capacity built in America. They are vertical compound condensing, with the low pressure placed above the high pressure cylinder, the crank, connecting-rod, etc., being entirely enclosed and running in oil, as in the single acting type of Westinghouse manufacture. The governor, operating in an oil case, is of the same general type as the one used in single acting engines. The shaft makes 200 revolutions per minute and carries a fly-wheel eleven feet in diameter, weighing twelve tons. It is coupled to the dynamo shaft by a flexible coupling without insulation. In the space just west of these generators are located the remaining belt driven machines. These have pulleys nine feet in diameter, and are driven by seventy-two inch belts from McIntosh & Seymour, Atlas, and Buckeye engines of 1,000 horse power each. These engines are all compound and run with condensers. In the space directly west of these engines are located the last two dynamos, which are also driven direct from two of the new 1,000 horse power Westinghouse compound engines. The 700 horse power generator supplying part of the exposition power service, is located just east of the incandescent lighting plant. This is driven by a cross-compound Reynolds Corliss engine of 700 horse power capacity, the armature being between the two engines on the same shaft. The fields of this large generator are so designed as to slide away from the armature to allow of repairs to any part without lifting, unless there should be trouble in the bearing. This machine furnishes current to the general power distribution system in the grounds.

All of the incandescent machinery in this plant is controlled from a single switch-board, which is by far the finest piece of work of this character that has ever been carried out. It was deemed inadvisable to place switch-boards at different parts of the extensive space covered by the machinery, principally for want of floor space. To gain space and to have the switch-board attendants in a location where their attention would not be so frequently called from their work, it was decided to place the entire switch-board on specially designed galleries. These switch-board galleries are placed against the south wall of machinery hall immediately in the main center. The lower gallery is twenty feet wide and forty feet in length. On this gallery is placed the dynamo switch-board. This board is composed of thirteen panels for the alternators, four panels for four 100 horse power generators used as exciters and one general exciter panel. Twelve of the alternator panels are used for the twelve generators, the thirteenth being used for the two 4,000 light alternators. This dynamo board is built of iron and marble, no combustible matter whatever entering into its construction. All of the connections are behind the board. On this same gallery

ELECTRIC FOUNTAIN.

are arranged the large rheostats for the field circuits of the generators. The panels on this gallery are connected with the dynamos by means of lead covered cables supported on the floor in special iron brackets, and led down the wall behind the paneled sheathing, from which point they are distributed to the different machines underneath the flood of machinery hall, by the use of lead covered cables supported in iron clamps. The lower gallery is reached by a single iron spiral railway, and the upper gallery which is fourteen feet in width and eighty-three feet in length, is reached by two narrow stairs, one at each end of the dynamo board. On this upper gallery is located the feeder board, which is also built of iron and white marble. This feeder board consists of a panel for each of the forty feeders leaving the station for the different parts of the ground. Nothing appears on the face of it but the indicating instruments, and the handles of the switches, with the various plugs and cords required in making changes from one dynamo to another. As in the case of the dynamo board, all wiring is back of the panels and everything is made as nearly fireproof as possible. Behind this board are located the transformers for the Stillwell regulators, one of which is inserted in each of the forty feeders leaving the station. These regulators provide for a variation of ten per cent. in the feeders, the losses in the



GENERAL ELECTRIC ARC PLANT, ELECTRICITY BUILDING.

feeders themselves ranging from 2 per cent. to 10 per cent. under full load. All of the instruments used on both switch-boards are of the frameless plate glass case type. Each panel is made a duplicate of all other like parts in the board, everything being interchangeable. The trimmings on both boards are nickel-plated metal and hard rubber. The feeder board is so arranged that any one of the forty circuits can be operated from any one of the dynamos of the plant. It is also so designed that in case of one of the dynamos becoming disabled, the feeders of this particular machine can be changed to a relay dynamo, always kept in operation, by simply pulling the switches. It is impossible to fully describe the switchboard or any part of the installation in a short article, as the exhibit must be visited to fully appreciate the character of the work.

Besides the incandescent lighting plant just described, the Westinghouse company furnishes all the power for driving machinery in the mines and mining building. For this purpose two 150 horse power 500 volt continuous current motors of the multipolar type are installed in the mines building and connected to the shafting driving exhibit machinery. These are operated from the large power generator in machinery hall.

In electricity building a very creditable exhibit is to be made, some of the special features being a long distance power transmission plant, in which is shown a two-phase generator driven by a Pelton water wheel, the current from this generator to be led to "step up" transformers and then to "step down" transformers. In another space are multiphase motors, revolving transformers, incandescent lights, arc lights, street railway motors and other devices, all operated from the alternating current generator in the space across the aisle. In this exhibit is also shown a 500 horse power two-phase alternating current motor. A complete exhibit is made of incandescent and arc lighting apparatus of the ordinary types of Westinghouse manufacture, and also of the various details manufactured. In another block of space in this building may be seen the railway exhibit of the Westinghouse company, which comprises large belt driven railway generators, and one of the direct connected 270 horse power "kodak" generators. The space occupied by Westinghouse exhibits in electricity building is something over 15,000 square feet.

The Work of Last Week.

Through the discouraging weather of the early part of last week and the brighter days of the closing portion, the work at Jackson Park was pushed with feverish activity. Officers and employes of the construction department, chiefs of departments and their subordinates, exhibitors and concessionaires all labored at high pressure. From ten to twelve thousand men were employed on the grounds, and in many portions work was pushed day and night. The sound of hammer and saw was heard on every side; messengers were running in all directions; great gangs of men were at work on the roads and landscape features; trucks and delivery wagons heavily loaded with exhibits and service supplies succeeded one another so closely as to form a score of winding processions; long lines of freight cars, loaded and empty, followed puffing locomotives on all the railroad tracks leading to the great buildings; creaking cranes and derricks dotted many of the buildings in which machinery was being installed, and in all show-cases and booths were being erected or placed in position; painters and decorators were at work in every corner; and the whole scene was one of the greatest animation and activity, enlivened by hoarse cries of command or expostulation in half a dozen languages and diversified by the queer costume of Turk or Egyptian. Many workmen put in sixteen hours out of twenty-four and made $6 or $7 a day.

In all this "hustle" and bustle the electrical preparations did not lag. Chief Barrett spent most of the week in the electricity building, sleeping there nearly every night. He was ably seconded by his assistants, Messrs. Hornsby and Hawley, who were untiring in their efforts to get things in shape. On Wednesday night a fifty-light circuit of arc lamps was operated for the first time, and night work became general. Everybody was working with a vim, and, while the display in the building was not complete at the close of the week the indications were that it would be entirely finished in ten days or two weeks.

No force of men connected with the World's Fair put in harder or more effective work last week than the "boys" of the mechanical and electrical engineering departments. They worked night and day, and during the latter part of the week R. H. Pierce, the electrical engineer, and Mr. Neiler, assistant electrical engineer, never left the grounds. Demands for arc lights came from every quarter, as the need of night work was pressing, and the energies of the department were mainly devoted to meeting these requests. Four coronas, with about 250 arc lamps, were burned under the giant trusses of the manufactures building nearly every night of the week, and light for the installation of exhibits was also furnished to the other principal buildings. On Friday night arc dynamos with a capacity for 2,500 lights were ready for operation in machinery hall. Much work was also accomplished in the way of placing decorative lights about the basin, in front of the administration building, which was the center of attraction at the opening on Monday. All the power, police and fire alarm wires were taken down from the temporary pole lines, the permanent wiring for these branches of the service being entirely completed. An automatic device for the electrical operation of the valve admitting steam into the cylinders of the Allis 2,000 horse power engine was devised, and the electrical connection setting the engine in motion was arranged to be made by a switch at the stand in front of the administration building, to be turned by President Cleveland. This mere outline gives but a faint idea of the immense amount of electrical work accomplished during this exciting week, but it is safe to say that the remembrance of the stress and turmoil of it will ever remain a vivid recollection in the minds of the chief participants.

On Thursday the big Allis engine in machinery hall was turned over and it was also run without load on the succeeding day. It worked smoothly and well. The final touches were put on the beautiful Westinghouse switchboard and several of the big alternators. Manager Keller and Superintendent Reilly of the Westinghouse company have been forehanded in their work from the first, but they had plenty of work to do last week nevertheless.

There were many vexatious delays and annoying accidents. Preparations were made on Monday evening to pull down the iron stack of the old temporary electric power station and get it out of the way before many teams and people got on the grounds on Tuesday morning. A space was marked off toward the west in which it was proposed the stack should fall. In that direction there was a clear sweep and no danger. But the stack preferred to take another course. When the workmen engaged in the effort gave a pull on their ropes it tottered, swayed back and forth a moment, then with a crash fell across the electric wires and roadway to the north. As a result installation operations in the transportation building, telephones along the west side of the grounds and the fire alarm system were greatly interfered with. This gave rise to an international chorus of expletives. Thirty six temporary wires were broken, consequently everything from Sixty-second street to machinery hall and west of the lagoon was cut off from all communication with the service plant. The damage was repaired as quickly as thirty-five linemen could do the work.

On Thorsday a trial trip was made over the intramural road. A large number of invited guests assembled at the Fifty-seventh street station at 3:30 P. M., but owing to delays inseparable from the first trip from the car barns to a point so far north as Fifty-seventh street, it was nearly an hour later before the entire party was seated on the train which consisted of a motor car and three trailers. The approach of the train was also considerably delayed by the fact that some workmen had placed a hand car between the tracks in such a position that the wheels rested on the conducting rails, short-circuiting the system. The workmen were considerably startled at the display of fire that ensued, and the officers of the company experienced some annoyance. In the course of the ride several obstructions on the track were encountered in the shape of obtrusive guy-ropes and protruding platforms. These caused several delays, but it was demonstrated that only a few touches here and there were needed to put the entire system in running order. Among those on the train were B. E. Sunny, W. E. Baker, E. J. Spencer, B. J. Arnold, F. W. Horne, C. P. Matlack, C. H. Macloskie, G. K. Wheeler, J. Allan Hornsby, C. H. Wilmerding, Luther Stieringer and many others, including a large contingent of ladies. The chief engineer of the Alley "L" road of Chicago was an interested observer of the operation of the system.

An armature in the Thomson-Houston factories at Lynn, Mass., burst on April 9th. One piece struck F. C. Carter, a student, destroying the use of his right eye. His left arm was also broken, rendering amputation necessary.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

During the preparatory stages of the World's Fair the WESTERN ELECTRICIAN presented complete reports of the progress of the work on the electricity building and other points of interest to the eletrical fraternity. Now that the exposition is opened this journal will present, from week to week, complete and accurate accounts of the happenings at the fair, furnishing a comprehensive record of the part that electricity plays in the great exhibition. The illustrations will, as heretofore, form a special feature. The WESTERN ELECTRICIAN has exceptional facilities for handling World's Fair news. It is the only weekly electrical paper in Chicago or the West, and will give special attention to the exposition and the electrical people in attendance.

ELECTRICITY and gas have come into competition again in Germany. This would not be strange if the work to be done consisted in the production of light, but instead the contract in view is for the operation of a street railway system. It seems that the inhabitants of the town of Erfurt are dissatisfied with the existing horse-car system, and the officers of the municipality have for some time been considering the request of the Thomson-Houston International company for a concession to erect an electric railway on the overhead trolley system. The municipality is disposed to entertain the proposal, especially as it is intended to extend the tramway system. On the other hand another company offers to operate the street railway service by means of cars driven by gas motors, which have already, it is said, given good results in Dresden, with the advantage of its not being necessary to use overhead wires. A decision has not been reached, but the city has appointed a commission to investigate the matter. Attempts have been made before to adapt gas motors to street railway work, but without conspicuous success. It is probable that the Dresden experiments have not excited much apprehension among the advocates of electric traction in Germany.

One of the most important features of the gathering of electrical people at the World's Fair this year will be the meetings of the electrical congress in connection with the exposition. This congress, it is anticipated, will be composed of representative scientists from every part of the world, and the work they have in hand will be of great interest and importance to the industry generally. Former gatherings of this description have awakened considerable interest, and some of them have been instrumental in bringing about advancements in the art, and the determination of points in controversy. None of them, however, has had the excellent opportunity which is presented the congress which will assemble in Chicago this year. An idea of the line of work which has engaged the attention of former congresses may be gained from Prof. Carhart's article presented in this issue, as well as the topics which it has been agreed to discuss at the Chicago meeting. Upon the question of programme Prof. Carhart says: "The committee having charge of this important congress has been alive to the interests involved and the responsibility of making the most of the opportunity in the interest both of the science and the applications of electricity. The occasion is a fitting one on which to settle in an official way the matter of electrical and magnetic units and nomenclature for years to come. With this in view provision has been made for an official section or legislative council, the members of which shall be appointed by the governments which they represent. To this council shall be submitted all questions bearing upon the adoption of units and terms. After the legislative council has passed upon the questions coming before it, the units adopted will only need ratification by the several governments represented to become truly and legally international." The official character of the congress, together with the standing of the men who will compose the body, will lend great weight to its decisions. The fact that the meetings will be held under the sanction of the governments represented will greatly influence the public in accepting its decisions. Marked contrast is shown between the congress of 1881 at Paris; that, held three years later in Philadelphia, and those of more recent years, with which we are all familiar. These proceedings, while interesting, instructive and valuable, did not attract the wide attention or receive the same consideration as those of the original congress at Paris. It is believed that the Chicago congress, by reason of its official character and the eminence of the men who will participate in its deliberations, will even out-shine the Paris assemblage of 1881. This is to be hoped, at least. The gentlemen in charge of the arrangements have availed themselves of the experience and advice of the leading electrical scientists of this country and Europe.

By the time that this issue of the WESTERN ELECTRICIAN reaches its readers the news of the opening of the great World's Columbian Exposition will be familiar to two hemispheres. In the opening ceremonies, as in the work of construction and the completed exhibition, electricity played a prominent part, for it was by the completion of an electric circuit, by means of a switch turned by President Cleveland in the stand erected for the exercises, that the largest engine in the service plant was started, signalizing the formal opening of the exposition. At the Centennial President Grant turned by hand a valve supposed to admit steam into the cylinders of the Corliss engine, although it is now asserted that the wheel thus actuated was a dummy and that the real valve was manipulated by a workman concealed from view. In 1893, however, the aid of electricity is invoked for a similar purpose. The change is indicative of the spirit of the age, and it is also significant that the engine set in motion by the president on Monday will drive electric lighting machinery, with a maximum capacity of 20,000 16 candle power lamps—an achievement undreamed of in 1876.

It needs but a glance through the pages of the richly illustrated issue of this journal now before the reader to assure him that in many respects the World's Fair is simply a great electrical exhibition. Not only is a separate building devoted to electrical exhibits for the first time in the history of international expositions, but it is a fact that only a small portion of the current used on the grounds will be employed in this building. Every portion of the grounds will be supplied with circuits for electric light and power. There are direct and alternating current arc lamps and lights of this description run on ordinary incandescent circuits and on 500 volt power circuits. In incandescent lighting the systems are no less varied—alternating, direct current, two-wire, three-wire and five-wire. Power transmission is accomplished by continuous, ordinary alternating and multiphase currents on circuits of 110, 220 and 500 volts. Electric traction is shown on an elevated structure, where trains capable of carrying 400 passengers are operated by motors of over 500 horse power capacity. Secondary batteries are pressed into service to operate a large fleet of electric boats, with a charging station reputed to be the largest in the world. The greatest search-light in the world is mounted on one of the buildings, amid a number of other large projectors. The electric fountains will be very beautiful and impressive, and will undoubtedly excite as much popular attention as any other single feature of the exposition. Decorative lighting will be lavishly used, not only in the electricity building, but all about the grand basin, which is perhaps the central point of interest. Electric elevators will be in service, cooking will be done by electricity, and experiments will be made on the effect of electric light on plants deprived of sunlight. Nearly every kind of dynamo and motor in use will be shown attached to the moving power by about every method known to mechanical engineering. In short, every application of electricity known in the arts will be presented. All these features are briefly described in this number, which is believed to be the most complete exposition of electricity at the World's Fair ever attempted.

All this has not been accomplished without great energy and effort, and there have been disagreements and heart-burnings in the electrical as well as all other departments of the great work that has engrossed so much of Chicago's attention for the last three years. These are due to the infirmities of human nature, and were to be expected in an enterprise of the magnitude of the World's Fair. But now that the exposition is fairly open and the perplexing questions that have arisen during the work of construction are nearly all things of the past, we may expect that all interested in the exposition will devote themselves heartily to the reception of Chicago's guests, forgetting old animosities.

The thanks of the electrical fraternity are due to the officers of the exposition, both national and local, for the enlightened and progressive spirit they have displayed in making the World's Fair a reflex of this electrical age. To such men as George R. Davis, D. H. Burnham, H. B. Stone, Col. R. C. Clowry, John P. Barrett, Frederick Sargent and R. H. Pierce the success of the electrical side of the exposition is due, and this is a fact worthy of general appreciation.

We only voice the sentiment of the electrical interests of Chicago and the World's Fair when we extend a most hearty welcome to all prospective visitors interested in this extremely interesting display. We assure them that they will have no occasion to regret a trip to the World's Columbian Exposition.

The World's Electrical Congress.

By Prof. H. S. Carhart.

The first international electrical congress ever held convened at Paris in connection with the International Exposition of Electricity of 1881. The success of this first convocation of electricians stimulated other later efforts to achieve a similar success. But the Conference of Electricians at Philadelphia in 1884, the Congress at Paris in connection with the General Exposition of 1889, and the Electrotechnical Congress at Frankfort in 1891 fell far short of making the impression on the electrical world produced by the first congress in 1881. This was not because they were not attended by electricians foreign to the country in which they were held, but because gade the steel were not official and the congress not strictly under governmental auspices. Another reason was that the progress made in theory and investigation since the decisions of the Congress of 1881, did not warrant any supplementary conclusions or any rectification of the units already adopted.

In 1881 the most distinguished electricians of Europe and America were in attendance at the congress by government appointment. Hence their conclusions were accepted as official, and carried weight both because of the distinguished reputation of the conferees, and because of their official relation to the congress. The Philadelphia Conference was a quasi-official one, but it accomplished little because it came too soon after the great assemblage of 1881. A part of the appropriation made by Congress, which was small, was expended in the determination of the ohm; and fortunately, for that work by Professor Rowland, has a permanent value.

For the system of electrical units employed for the last twelve years we are indebted to the first Paris Congress. In fact the name ampere as the unit of current was introduced at that time; and arrangements were set on foot for the determination of the ohm in terms of the length of a mercurial column at 0°C. and one square millimetre in cross-section. After eleven years the conclusion reached was formulated by the British Association committee on electrical units and standards at Edinburgh last August, with the concurrence of representatives from other countries, including Professor von Helmholtz. The length of the mercurial column is 106.3 Cm.

Before me lies a stout pamphlet entitled "Propositions on the Legal Definitions of Electrical Units." It was prepared by Dr. E. Dorn of Halle, gives an account of the Edinburgh meeting mentioned above, and reviews the work done on the determination of electrical units up to the present. This masterly brochure issues from the Curatorium of the Physikalisch-Technische Reichsanstalt in Berlin, under the signature of Dr. von Helmholtz, and is published by the order of the state secretary of the interior. It is sent out with the double object of conveying information and of eliciting any objections that may exist to the adoption of the practical units proposed. Germany is therefore already taking steps toward the official adoption of the conclusions reached at Edinburgh.

The stenographic report of the Frankfort Congress of 1891 fills two large volumes. The last one, bearing the date 1892, has just been received. A glance at the contents reveals the fact that many papers of permanent value were read and discussed. The officers of the congress have done the electrical profession a service by putting these papers in a form for preservation and reference. But the report indicates no important or authoritative steps taken toward the settlement of residual uncertainties in nomenclature and definition. Nor were additions made to electrical and magnetic terminology, which many deem important.

So much in relation to the results of past congresses. The World's Fair offers an opportunity for the gathering of electricians from all parts of the world. Every day brings information that distinguished members of the profession are coming from abroad. The committee having charge of this important congress has been alive to the interests involved and the responsibility of making the most of the opportunity in the interest both of the science and the applications of electricity. The occasion is a fitting one on which to settle in an official way the matter of electrical and magnetic units and nomenclature for years to come. With this in view provision has been made for an official section or legislative council, the members of which shall be appointed by the governments which they represent. To this council shall be submitted all questions bearing upon the adoption of units and terms. After the legislative council has passed upon the questions coming before it, the units adopted will only need ratification by the several governments represented to become truly and legally international. If this shall be accomplished and the Congress does nothing else, this will forever remain a sufficient *raisond'etre*.

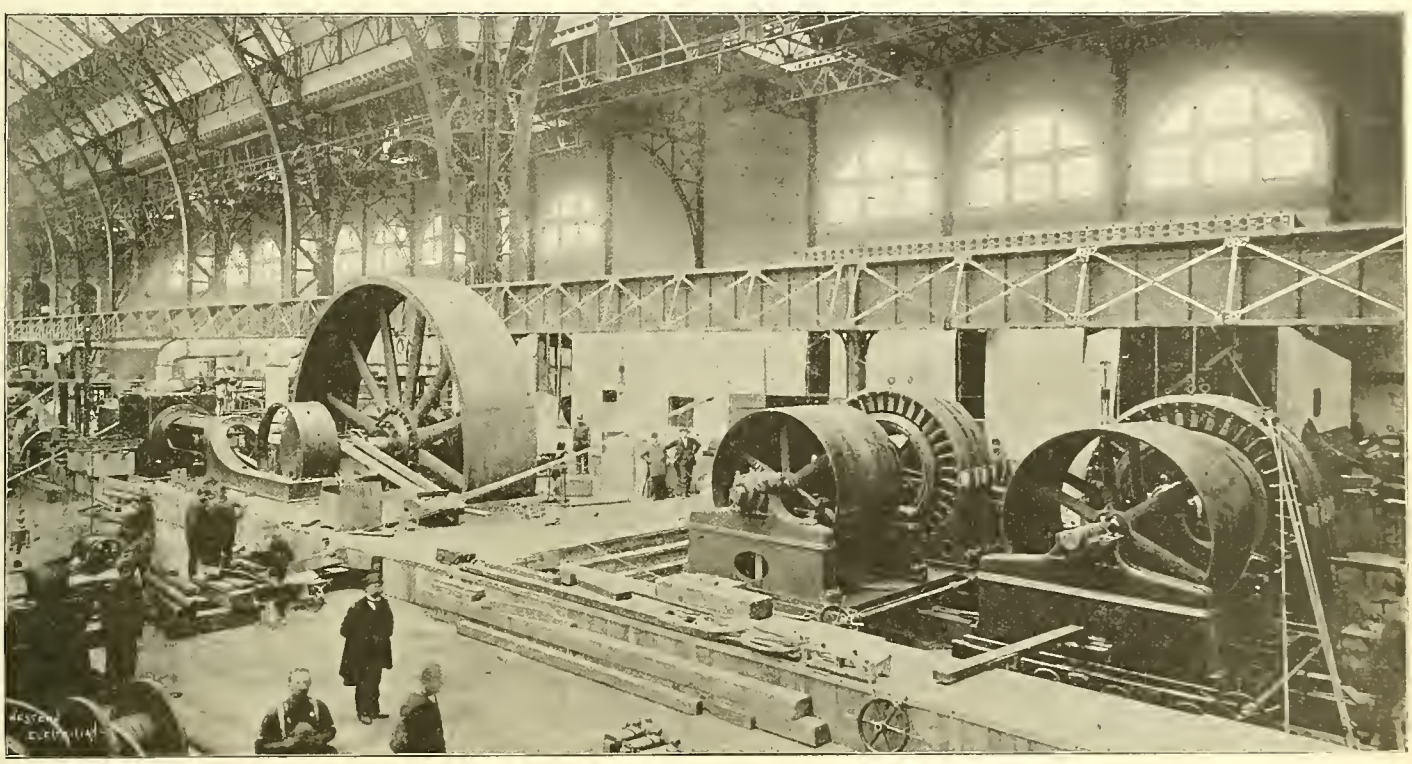
But much more than this is proposed. The committee on programme and papers is presided over by Professor Mendenhall, director of the United States Coast and Geodetic Survey, and numbers among its members Professor Rowland and the sub-committee of the American Institute of Electrical Engineers. This committee has been for some time at work, and will hold a meeting in Washington, at which time the business will doubtless be greatly forwarded. The joint committee of the British Royal Commission and of the London Institution of Electrical Engineers has already done good service and is still ready to aid. Its co-operation will contribute greatly to the success of the congress. To it can be committed the task of securing appropriate papers from English electricians.

Another important feature of the congress will be its public illustrated lectures. Two or three of these will probably be given. The most recent and most striking experiments will probably be shown on a scale worthy of the occasion. This feature will render the congress an occasion long to be remembered, as affording an opportunity for visitors from many countries to witness the latest successes and most impressive phenomena that the science can present.

Only twelve years have elapsed since the Paris International Exposition of Electricity. Then electric lighting was in its infancy and was probably witnessed for the first time by many thousands. The World's Fair will exhibit electric lighting on a scale never before attempted or proposed. It may not exhibit novelties but it will certainly be impressive by its magnitude. In 1881 the electric railway, built by Siemens & Halske to run a few hundred feet from the exhibition building, was one of the most interesting novelties. It is not necessary to say that electric railways are no novelty now.

The electrical congress of 1881 placed applied electricity on a scientific basis, supplied it with units of measurement, and produced a stimulus to the invention of instruments of precision that is still felt all over the world. Sir William Thomson went home from it and brought out his "graded galvonometers," the first of a long line of the most valuable standard instruments. He also published not long afterward his theoretical investigation of the best relation between the resistances of a shunt dynamo; and Clausius, who was also a member of the congress, followed with his exhaustive theoretical paper on the dynamo machine. It was to be sure a period of great activity in electrical discovery and invention; but the congress has had no inconsiderable share in directing this activity and furnishing it with the means of quantitative expression.

It is not at all improbable that the influence of the World's Fair on electrical activity will be no less forceful than at Paris; and the congress of electricians, let us hope, will make this an occasion of signal usefulness and of international electrical unification.



ALLIS 2,000 HORSE POWER ENGINE DRIVING TWO WESTINGHOUSE 10,000 LIGHT ALTERNATORS, MACHINERY HALL.

The city council of Lonaconing, Md., has granted a franchise to the Lonaconing Cumberland Railroad & Power company, which will build an electric railway from the city of Cumberland, via. Lancaster to Westernport.

The Rutland Electric Light company, Rutland, Vt., after long continued litigation with the Marble City company, has at last secured a perpetual injunction restraining the Marble City company from so erecting its poles or stringing wires as to interfere in any manner with its poles. This decree was confirmed with order for removal of all conflicting wires and poles of the Marble City Electric Light company by the Supreme Court of Vermont, Judge Tyler, presiding. The decree of the court also provides that a commission shall be appointed to determine the amount of damage sustained by the Rutland company by the Marble City company's infringement on its rights and property.

Telephone and Telegraph Service.

Modern telephone and telegraph service showing the best construction attainable to-day in both these important departments will be a most important feature of the arrangements for the fair. The equipment specially prepared for the exposition business is described in the appended articles:

World's Fair Telephone Exchange.

BY A. S. HIBBARD.

In the west corridor of the American Bell Telephone company's booth, at the south end of electricity building, the World's Fair telephone exchange is operated by the Chicago Telephone company.

The main distributing board, from which all the cable wires are directly led, is placed at the south end, and is directly over a large man-hole, eight by eleven feet, into which the underground conduits and cables are led. The top of this man-hole is covered by an iron grating, and the man-hole itself is so illuminated that its interior may be plainly seen, and the cable heads, conduits, bridle wires, etc., are in plain view.

From the main distributing board the wiring leads to the intermediate distributing board, next to which comes the operating switch-board itself. This consists of five and one third sections of a three-wire branch terminal multiple board, manufactured by the Western Electric company. One and one-third sections are utilized for incoming trunk wires, which will be operated on the single wire plan, with visual signals provided for the disconnection order. The four additional sections, with positions for three operators each, provide for 800 lines which may be operated in the World's Fair exchange. Visual signals are arranged governing all outgoing trunk wires. The annunciator drops are of the self restoring pattern, and the latest mechanisms employed in switching appliances for telephone exchanges are here found in operation.

All telephones operated in connection with the exchange are of the long-distance pattern and are connected by copper metallic circuits. All of the trunk wires are also metallic circuits, there being fifty outgoing and fifty incoming trunk wires operated in connection with the exchange.

A call may be made from a subscriber's instrument at the World's Fair to a subscriber in the main Chicago exchange on Washington street, as quickly as from one main office subscriber to another, and the transmission has been found to be just as perfect as over shorter exchange lines.

The long-distance lines are led directly to one of the switching sections, by means of which conversation may be had with New York, Boston, Pittsburg, Buffalo, Detroit, Milwaukee and other points reached directly by the long distance lines.

At twenty-five points in the various buildings throughout the grounds public telephone stations and American District Telegraph messenger offices have been established by the Chicago Telephone company. At these offices sound-proof booths have been provided, making it possible to carry on conversations with the the utmost privacy. Persons within the various buildings who may not have telephones may be called by messenger to any one of these public stations, and the wants of the general public, both for telephone and for messenger service, will thus be provided for.

In establishing this telephone exchange upon the most modern and best metallic circuit basis, the Chicago Telephone company is showing what may now be accomplished in any exchange similarly equipped.

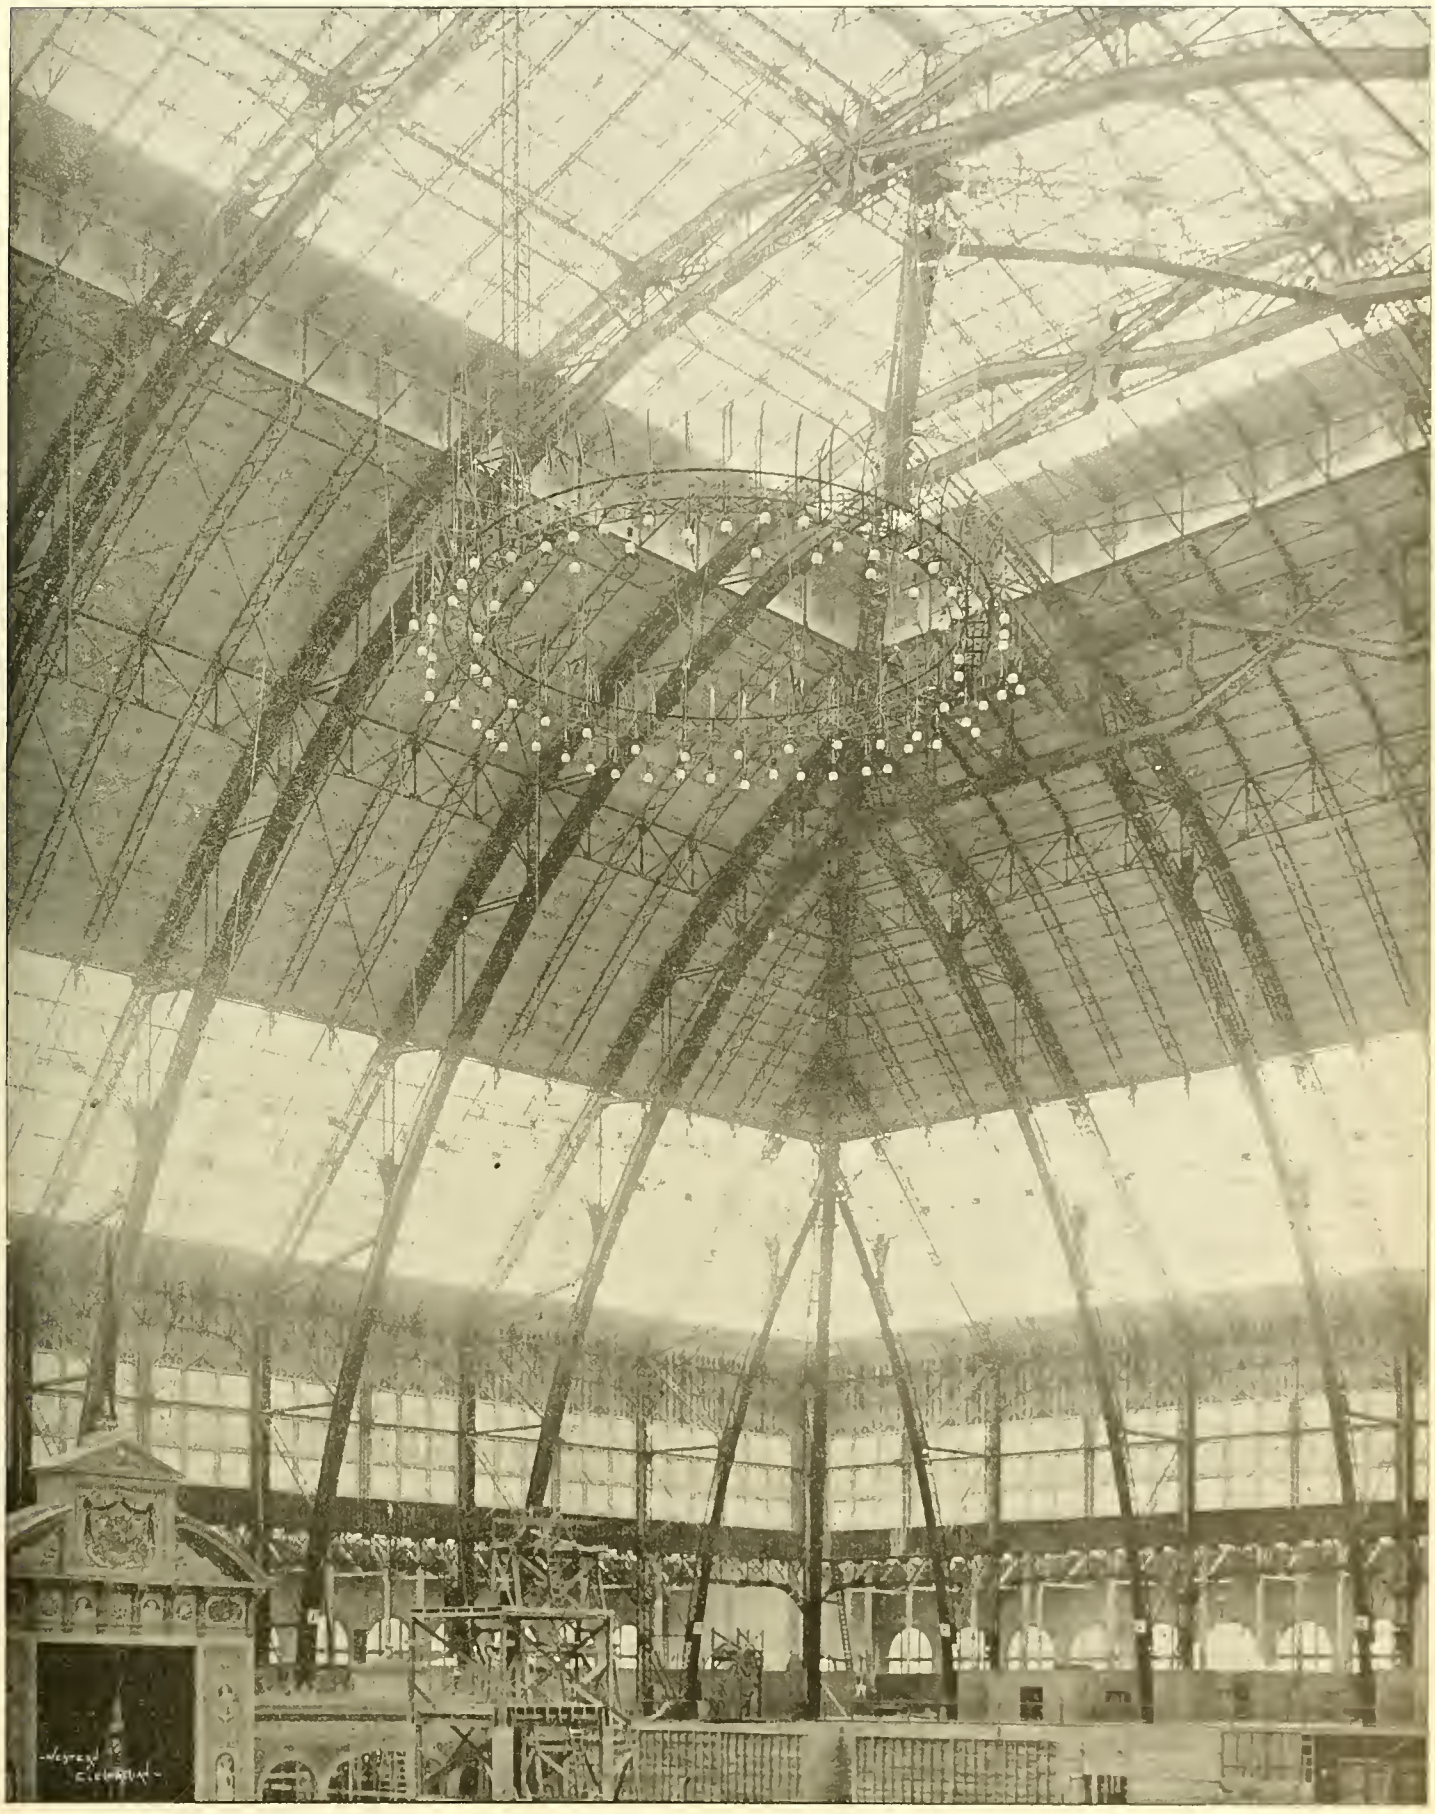
Western Union Telegraph Service.

BY WILLIAM J. LLOYD.

Whether it be a national convention, a national election, the inauguration of a president, a Johnstown flood, a Homestead riot, or a New Orleans prize fight, the service of the Western Union Telegraph company has always been foremost in its adequacy and its promptness. In its mag-



SEVENTY EIGHT LIGHT ARC CORONA, MANUFACTURES BUILDING.

nitude and scope it will in our time at least stand without an equal, and yet how few in busy America stop to think of the advantages or the vastness of such a system. It is safe to say that the Western Union in its preparations for the World's Fair is making an effort beyond anything yet attempted by that company, but only wire company men will comprehend the great work of preparing for the fair, and, simultaneously with the opening date, the removal of its Chicago office. It is the second largest in the country and its ramifications probably the most complex in the world, considering the great number of trunk line railroads centering at Chicago, its grain and stock exchanges, its leased wire offices, its newspapers, press associations, branch offices, time service and all the varied interests centering in Chicago main office.

The visitor to the great exposition will find the main office of the company in the southeast wing of the administration building fully equipped with direct wires to all leading cities of this country, dynamo currents, quadruplex, duplex and single wire machinery manned with the best grade of operators and receiving clerks capable of speaking the popular tongues of Europe. In addition to this there will be branch offices in the manufactures, machinery, agricultural, casino, terminal, transportation, service, mines, electricity and fisheries buildiogs, together with other branch offices in the California, Washington and New York state buildings. In the Midway Plaisance there is to be an office at the Ferris wheel and one in the German cafe, with possibly others not yet located.

To meet the requirements of the press and public, the Western Union company has strung a 19 conductor aerial cable from its Twelfth street underground terminal to the exposition grounds, and, if necessary, each conductor can be quadruplexed, making a total of 76 circuits—a greater number than was available at the recent national convention held at Minneapolis, where a single day's transmission reached the great number of 470,000 words, and this, by the way, was in excess of any one day's filing at any of the national conventions held so far in this country.

From the main office on the exposition grounds leading to all of the buildings mentioned there is a complete underground system carrying cables necessary for the branch offices and for the time service, which will be made a special feature by the telegraph company in connection with the Self-winding Clock company. Arrangements have also been completed for daily connection with the National Observatory clock at Washington so that the dropping of the ball at high noon, so familiar to our New York friends, will greet them from the great dome of the government building on the exposition grounds, the same circuit being utilized daily to synchronize all clocks located in the different buildings throughout the grounds.

In the electricity building the company has established a magnificent booth for the display of an interesting collection of historical devices and other apparatus of special value, including the original apparatus used by Prof. Morse and a photographic copy of the first message that was sent by him; a bust and portrait of Prof. Morse and his mementos and diplomas that were bestowed upon him by various cities and countries; one of the most modern quotation instruments; a Western Union telegraph office in operation, from which messages may be sent to all parts of the world; statistical tables showing the growth of the Western Union Telegraph company and its relation to the wealth, population, railroad mileage, etc., of the country. These exhibits will refer to the land line system.

Then to represent the cable service of the company and its connections in Europe, South America and the far east, there will be a bust and portrait of Cyrus W. Field and various interesting mementos of him in connection with the first Atlantic cables; a model of the Great Eastern, which was the first steamship employed in laying the Atlantic cable; a model of the repairing ship of the Central & South American Telegraph company, which is the latest repairing ship that has been built; a model of the original grapnel that was used in the first Atlantic expedition; models of the most recent grapnels for deep sea work; samples of the submarine cables of the Western Union Telegraph company and of the materials of which they are composed, photograph of the Great Eastern; model of the bed of the Atlantic ocean; map of the world; model of the steamship Mirror. In design and equipment this booth will probably prove one of the most attractive of the electricity building.

In addition to the 115 branch offices which the Western Union had already established previous to the exposition, it has established 65 new ones, making a total of 250 branch offices in the city of Chicago to be operated during the period of the fair, so that the stranger visiting Chicago during the coming half year may be in constant communication with business interests, home and friends.

An especial effort will be made on the part of the company to give the most prompt service between all principal hotels in the city, so that telegrams between friends making appointments, meeting places, etc., will be transmitted without delay.

Postal Telegraph-Cable Company.

BY E. J. NALLY.

The Postal Telegraph-Cable company has arranged for a main office on the ground floor of the administration building, which will be equipped for a modern telegraph office. The tables are especially made for the office, and are constructed so as to provide accommodations for typewriters, with which each table will be equipped after an improved plan. All business will be received by expert typewriter operators, as this company makes the use of the typewriter a feature of its service. Direct connection will be had with all the principals cities from the main World's Fair office, including a special wire to the cable office. Branch offices will be found in the agricultural, electricity, mining, machinery, casino, service, manufacturers and liberal arts, and in several state buildings, making fifteen to eighteen offices in all. There will be two offices in the manufacturers and liberal arts building, one at the south and another at the north end. The company has also arranged for exclusive privileges for branch office purposes, in more than twenty-five of the hotels, located outside of the exposition grounds, but in the immediate vicinity. Employment will be given to seventy-five people within the grounds proper, and the same number in the various hotels, in the vicinity of the grounds.

The Commercial Cable company which is the ocean connection of the Postal, has arranged for an interesting exhibit at its headquarters in the electricity building where a pavilion has been erected. This display will present in miniature a complete model of the Mackay-Bennett system. The sides of the pavilion will be fitted up to represent the terminal stations of the company at Dover Bay, Nova Scotia, and Waterville, Ireland. The apparatus used will be duplicates of the instruments employed in these stations, and will consist of siphon recorders by which the signals are received and improved automatic transmitters by which the messages are sent. Dover Bay and Waterville are in reality about twenty-seven hundred miles apart. In the working model they are separated by twenty-seven feet. They are connected, however, by a duplex artificial cable, electrically identical with the deep sea cables employed by the Commercial Cable company. Visitors will have an opportunity of witnessing the method of transmitting and receiving cable messages at this booth. There will be an interesting display of all kinds of cable in different conditions. The method of locating faults at sea, the laying and repairing of cables and other practical features of everyday cable work will be shown. A seven foot model of the "Mackay-Bennett" the latest repair ship of the Commercial company will be on exhibition. The pavilion in which this display is made forms one of the most artistic structures at the exposition.

Columbian Intramural Electric Railway.

BY C. H. MACLOSKIE.

Provision is made for the transportation of visitors about the grounds of the Exposition, affording an excellent view of the buildings and the ornamental features of the grounds, by the establishment of an elevated electric railway system. The Columbian intramural railway skirts the whole of Jackson Park, giving ready access to all of the prominent buildings of the fair. Starting at the south loop, close to the reproduction of La Rabida, it passes south by the side of the Krupp gun and the leather exhibits, the forestry building, turning west and north near the power station and carhouse of the railway. Thence through the midst of the exhibits of windmills to the colonnade, swinging around the west end of machinery hall, it turns north, passing in succession the railroad terminal station, the transportation, horticultural and woman's buildings and reaching that part of the grounds allotted to the state buildings. Proceeding still farther north it passes through the Esquimaux village, whence it turns east and south near the art galleries, and ends at the north loop close to the fisheries, United States government and manufacturers' buildings.

There are in all ten stations, each train making eighteen stops in a round trip. The stations are arranged with special reference to the safe and rapid handling of the large crowds which will be encountered. The stairways are wide and easy to climb and the stations themselves are brilliantly lighted with incandescent lamps. The ticket offices are placed so that in most cases one ticket office will answer for passengers going in either direction.

The length of the road is about 6¼ miles of single track, and counting stops at stations, the time taken for the round trip is about 45 minutes. Fifteen trains running continuously give a headway of three minutes. The average speed during the round trip is low, but at certain points a speed of 30 miles per hour is attained. The short distances between stations and the large number of curves prohibit high speed, except in a few instances.

Each train consists of four open cars with a total seating capacity of 400 passengers. The cars are 50 feet bodies, built with cross facing seats, each compartment being closed in on either side by a pair of sliding doors operated from the end of the car.

Fourteen incandescent lamps evenly distributed along the sides of each car furnish an abundant supply of light, and give the car a cheerful appearance at night. The cars are built by the Jackson & Sharp company of Wilmington, Del., and are mounted on trucks manufactured by the same company after the pattern of the trucks now in general use on the Chicago and New York elevated roads, with a few improvements in design which have been suggested by experience on the roads mentioned. The wheels were furnished by the Griffin Wheel & Foundry company of Chicago. A new style of wheel is here introduced to elevated service. This wheel is a cast iron spoke wheel, 36 inches in diameter with M. C. B. tread, flange and wheel fit, the spokes set spirally so as to relieve the shrinkage strains.

The brakes were furnished by the New York Air Brake company, and are of the type known as the "straight air." This form was chosen on account of its advantage over the automatic, in the ease of making smooth and accurate stops. This advantage was thought to more than offset the special feature of the automatic air brake since the probabilities of four car trains breaking in two are slight.

The Jewett Supply company's roller bearing device has been placed between the body bolster and the truck bolster, so that the cars creep around the curves with much less friction and consequently with less noise than the ordinary form of side and center bearings.

The first car of a train is equipped with four motors, capable of developing 133 horse power each, at a speed of 25 miles per hour. These motors, specially built for this equipment, are of the four-pole type, with toothed armatures, connected to the axle through a single set of gears.

The speed of the motors is controlled on the series-parallel principle, the motors being all in series at the start, in series-parallel for intermediate, and in parallel for full speed. The changes are made gradually so that no sudden jumps are felt as the speed is increased. As the current required is large, the controlling apparatus must be correspondingly heavy, and in consequence it has been found necessary to move the rotating cylinders of the controller by compressed air. Thus, to stop, start and regulate the speed of the train, a small lever is employed similar to the three-way valve of the air brake, enabling the motorman to handle his train with ease and accuracy.

The compressed air is supplied by a pump operated by a 3 horse power motor. In connection with this a novel device has been introduced, comprising a starting rheostat operated by air and regulated according to the pressure in the reservoir. When the pressure exceeds the normal, the motor is automatically stopped, and as the pressure drops, the starting rheostat operates and the pump resumes its work.

The current is carried from the power station to the trains through a conductor consisting of a T rail, supported on insulating blocks just outside of the tracks. Four sliding shoes, two on each side of the car, make the connection with the conductor, the current returning through the wheels to the rail, and thence through the steel girders of the superstructure to the power station. To make the necessary connections between girders, large plates of copper have been riveted to the steel with copper rivets.

The superstructure is essentially of wood; 12 inch by 12 inch yellow pine posts set on concrete foundations support a heavy cap of the same material, on which rests the 15-inch steel I beams. On the top of the I beams the ties are laid and bolted. Four guard timbers form a part of each track and distribute all stresses produced by the starting and stopping of trains.

The power plant of the railway has a capacity of 3,700 kilowatts and is equipped with the latest approved forms of apparatus. The generators include a 1,500 kilowatt machine, directly connected to an Allis cross compound condensing engine; a 750 kilowatt, directly connected to an Allis tandem compound condensing engine; a 750 kilowatt directly connected to a Williams compound condensing engine; a 500 kilowatt belted to a Greene tandem compound condensing engine, and a 200 kilowatt, directly connected to a MacIntosh & Seymour tandem compound condensing engine. The pumps and condensers used are the Allis, the Worthington, the Gould, the Deane, and the

Smith-Vaile. The boilers, ten in number, were built and installed by the Babcock & Wilcox company and they are equipped with the latest appliances for burning oil. The combined gases, in going to the stack, pass through a water heater built by the Greene Fuel Economizer company. The entire electrical equipment of the railway was furnished by the General Electric company.

With a headway of three minutes or twenty trains an hour, the capacity of the road is 16,000 passengers per hour. To handle such large crowds with speed and safety it was found necessary to equip the track with a complete block signal system. The work has been done by the Rowell-Potter Safety Stop company of Boston, Mass. The apparatus is in the main mechanical, electricity being used only to release the block and set the signals at safety. The principal feature of the system is found in a device which throws off the current and sets the brakes on the train in case the motorman runs past a danger signal. A signal out of order acts likewise, excepting that notification is at once given to the motorman.

The officers of the company are: B. E. Sunny, president; E. C. Ward, secretary; W. E. Baker, general manager; C P. Matlack, chief engineer and superintendent; C. H. Macloskie, electrical engineer; R. I. Sloan, consulting engineer for superstructure; B. J. Arnold, consulting engineer and construction engineer for power station; G. K. Wheeler, consulting engineer for electrical equipment.

Exhibitions, Industrial, National, International and Electrical.

By W. J. Hammer.

Industrial exhibitions, contrary to many people's understanding, are of very ancient origin. Even the Olympic games had for over 1,100 years their industrial and artistic elements, and the great fairs of Astrakan, Nizhnee-Novgorod, Prague and Leipsic have been carried on for very many years.

The first great fairs instituted in France and Southern Europe were held about 1,310 years ago Among the more celebrated of the early ones are those of St. Denis, A. D. 629, Aix-la-Chapelle and Troyes about 800 A. D.; and they were carried into England in 886 A. D., and at the end of the 10th century they had become very common throughout Northern Europe. In 1797 steps were taken in France to organize at St. Cloud an industrial exhibition of carpets, tapestry and porcelain. This, the earliest French exhibition owed its conception to the tremendous spasm of the French Revolution. These arts were originated and fostered by Colbert and afterward maintained by the monarchy, and the exhibition was undertaken by the Marquis d'Avise by the authority of the Directory. The goods were to be exhibited and disposed of by lottery, but the day, preceding the opening, the exhibition was forbidden and the military commander, Augereau, put in possession. The Marquis d'Avise was compelled to leave Paris, a proscribed nobleman. This energetic and enlightened noble returned in 1798, and under the old regime organized an exhibition in the Maison d'Orsay and adjoining grounds. It remained open until General Bonaparte, the future first counsel and emperor of France, returned from his first brilliant Italian campaign and laid his magnificent spoils at the feet of the Directory. The exhibition was then moved to the Champ de Mars where it lasted three days and consisted of 110 exhibitors.

In 1801 the second exhibition was inaugurated by Napoleon, who had become first consul, and was held in the Royal Louvre for six days, with 229 exhibitors.

The third was held in 1802, and opened by Napoleon in person. This was fourfold larger than the preceding ones and lasted seven days with 540 exhibitors.

The fourth was held in 1806, under the empire, and lasted twenty-four days with 1,422 exhibitors.

In 1819 Louis XVIII. opened the fifth exhibition, lasting 35 days with 1,662 exhibitors, in the Louvre, and the king then decided that such exhibitions should become permanent national institutions to be held every fourth year.

In 1823 the sixth exhibition under Louis XVIII. was held in the Louvre, lasting 50 days with 1,642 exhibitors.

In 1827 the seventh exhibition under Charles X. was held in the Louvre, lasting 62 days with 1,695 exhibitors.

In 1834 the eighth was held under Louis Philippe, lasting 60 days with 2,447 exhibitors. The change of dynasty and political confusion prevented the ordinance of Charles X from being carried out three years before.

In 1839 Louis Philippe opened the exhibition in the Champs Elysees, lasting 60 days with 3,281 exhibitors.

Five years later, in 1844, Louis Philippe inaugurated the tenth exhibition, the last in his reign, running for 60 days with 3,960 exhibitors.

In 1849 the eleventh exhibition was opened by the new republic shortly after the dethronement of Louis Philippe. This lasted 60 days with 4,494 exhibitors. The growth and interest of these French exhibitions had begun to attract the serious attention of the governments of other continental countries, and in 1845 the King of Bavaria constructed the first permanent exhibition building at Munich.

It is also claimed that a proposal was made as early as 1844 to hold an international exhibition in England, although it is generally believed that the credit for the original conception of an international exhibition or World's Fair is due to Prince Albert, the Prince Consort of England, who in 1849 suggested the matter to the Society of Arts of London, of which he was the president. The first International exhibition was held in 1850 at the Crystal Palace in Hyde Park, and although the first development of national exhibitions in contra-distinction to the country fairs held previously was due to the prescient mind of Napoleon in his early prime, to the English is undoubtedly due the credit for the organization of the first World's Fair or International exhibition. The wonderful success of this exhibition aroused the spirit of emulation in other countries and steps were taken simultaneously to hold exhibitions in Dublin, Paris and New York. The latter was the first to open and was held in 1853, adjoining the Croton distributing reservoir on Fifth avenue between Fortieth and Forty-second streets.

The same year, the Dublin exhibition was opened and following that, the one in Paris in 1855. Others followed in rapid succession, and among the most important of these are the following: London, 1862; Paris, 1867; Vienna, 1873; Philadelphia, 1876; Paris, 1878; and Paris, 1881; London and Munich, 1882; Vienna and Amsterdam, 1883; Philadelphia, 1884; New Orleans, 1885; Paris, 1889; London 1892; that of 1881 at Paris being the first international electrical exhibition which had ever been held. It was opened August 11, 1881, and met with remarkable success. This was followed in the spring of 1882 by the Crystal Palace electrical exhibition, this being in turn followed by the electrical exhibition of Munich, which opened September 17, 1882.

In the following year, 1883, a second electrical exhibition was held at the Crystal Palace in combination with a gas exhibition, one-half of this magnificent structure being given up to each of the two systems of illumination. It is interesting to note that while the previous electrical exhibition had been exceedingly profitable to the Crystal Palace management, they suffered a considerable loss in the second exhibition owing to the great damage done by the gas to the tropical foliage, rare plants and vines with which the Crystal Palace was filled and for which it was justly noted; and in the smoke abatement and gas exhibition held shortly thereafter at South Kensington, it was claimed that the Royal Horticultural society suffered a loss of thousands of pounds, many valuable plants placed in their care being destroyed, due to the deleterious effect of the gas, the huge Siemens regenerative burners which had just come into use, being largely responsible for this. The use of the electric light has been demonstrated to have no such injurious effect, and in fact, the experiments of Siemens and others have proven that vegetation flourishes under the electric light, and the writer has seen strawberries and other fruit and plants which have been brought to perfection without the aid of sunlight, and solely by the aid of the electric light. Some of these have been exhibited at the various electrical exhibitions.

Immediately following the Crystal Palace exhibitions and the Munich exhibition, came the Electrical exhibition at the Aquarium in London, and about the same time the Electrical exhibition at Vienna, which took place in 1883, and in the same year the International exhibition at Amsterdam, Holland. Then followed the Electrical exhibition at Philadelphia, under the auspices of the Franklin Institute in 1884, and in the same year an International exhibition was held in Turin.

The next great exhibition was held in New Orleans in 1885. Passing over the Health, Fisheries, Inventions and American exhibition held in London about this period, and that of Spain shortly afterward, and other exhibitions of more or less importance in other countries, we come to the marvelous exhibition of Paris in 1889; then followed, in 1890, the electrical exhibition in Edinburgh, which in turn was followed by the electrical exhibition at Frankfort of 1891. The principal features at the Frankfort exhibition of 1891 were the interesting experiments in transmission of power employing the three-phase system. Following this was the electrical exhibition of 1892, held at the Crystal Palace.

With the exception of the telegraph, the last 15 or 20 years have witnessed the commercial development upon any considerable scale of practically all of the applications of electricity to the industrial arts, as we see them to-day. The writer proposes to give a brief summary of some of the most important electrical features, the birth of commercial development of which has been contemporaneous with certain of the International exhibitions, electrical and otherwise, already mentioned.

It may surprise many of the readers of the Western Electrician to find that practically all of the leading principles of the electric telegraph were enunciated prior to the first international exhibition in London of 1851. Before that year some thousands of miles of iron wire had been stretched upon insulators upon wooden poles in the various civilized countries, and a system of underground telegraph, using wire insulated with gutta percha, had been used in Germany, and disclosed the phenomena of lateral induction, which plays so important a part in the submarine telegraph of to-day. Submarine telegraph circuits were proposed and carried out, to cross the Rhone at Cologne, and other rivers, although the end of 1851 marked the laying of the first submarine cable between Dover and Calais.

Up to this time, various telegraphic systems had been used embracing the needle, dial and recording; worked with battery, and magneto electric machines, type printing, mechanical, recording, Bakewell's autographic, and the acoustic instruments of Dujaroin and others were employed, and the advances since have been mainly in scientific and practical development of principles, embodying, of course, the results of deep researches, and inventions of the utmost importance. The London exhibition of 1862 showed many applications of electricity, including those of telegraphy, railway signals and alarms, electro-plating, the Serrin arc lamp, Murray and Heath's arc lamp, the Holmes and Berlioz dynamos, and a great variety of test instruments, switches, insulators, cable, etc. Wheatstone, Wilde, Breguet, Siemens and Halske, d'Arlincourt, Dujardin, Bonoelli, Digney Freres, T. Allen and Jacob Brett exhibited various systems of automatic, telegraphic, ink recording, chemical embossing, Roman type and Morse telegraphic systems.

The Paris exhibition of 1867 also showed a large collection of similar applications of electricity. Among the most interesting things exhibited were Ladd's dynamo, which was said to have been the most astounding object in the Champ de Mars. This dynamo, according to the official report of United States Commissioner Samuel F. B. Morse, maintained at a white heat a yard or more of platinum wire one-half a meter or more in diameter, and gave a current equivalent to 25 or 30 Bunsen elements, and was constructed from borrowed plates of Wilde's magneto-machine, Ladd substituting electro-magnets, and adding a second armature and applying the dynamo principle of Siemens and Wheatstone of 1866. The machine of Soren Hjorth of Copenhagen, which he termed his magneto-electric battery, Day's Kerite wire was also exhibited and attracted very favorable attention, and the thermo-electric battery of Moses G. Farmer was shown, both of the latter being American exhibits.

The 1873 exhibition at Vienna showed a most interesting display of the various telegraphic systems, particularly those of the automatic systems of Siemens and Wheatstone, Gustav Jaite, Edison and Little, Meyers, Hughes' printer, Morse's register, the Siemens polarized relay, various types of batteries, including the Grove, Daniel, Bunsen, and Callaud types, Stearns' system of duplicating of telegraphic lines were shown, and Breguet, Siemens Bros., and Siemens and Halske exhibited resistance units based upon the B. A. unit and the mercury unit, the latter unit having been adopted at the Convention of Vienna in 1868, and affirmed at the Rome Convention of 1872.

Historical exhibits were made of Sommering's telegraph of 1809, Schilling's needle telegraph of 1832, Gauss and Weber, used from 1832 to 1838; Steinheil's of 1837; and Nottebohm, Siemens, and others exhibited lightning arresters, measuring instruments, mirror, sine and tangent galvanometers, portable bridges, battery testers, galvanoscopes, fire alarms, electric bells, dynamo blast exploders, by means of sparks and by heating wire; and Hefner-Alteneck, of Siemens and Halske, exhibited his dynamo for strong currents; a dynamo and head-light for the locomotive was shown, and hand electric lamps with Fresnel lenses.

Then followed the Centennial exhibition of 1876 at Philadelphia. Probably the most important electrical features connected therewith were the Bell telephone, which was first publicly shown there, the lighting of exhibition buildings for the first time by means of electric light, which

was carried out with the Wallace-Farmer dynamo and the Wallace plate carbon lamps.

Breguet exhibited some of the Gramme dynamos and Wallace showed his large Centennial copper plating machines. Gray's harmonic telegraph and other objects of great interest were shown.

In Paris in 1878, an interesting exhibition was made of telegraphic, telephonic, and electric arc lighting apparatus and metallurgical appliances were shown, and in 1881, the wonderful International electrical exhibition was held in Paris.

Space will not permit the writer to give a list of all the marvels shown there, but among the most important were the first extensive public display of the Edison and the Swan incandescent electric lamps; Edison's magnificent display of his various inventions, the feature which attracted the most attention being his huge steam connected dynamo, weighing about 22 tons; Maxim's automatic dynamo regulator, Siemens' electric railroad, which had been shown by him at Lichterfelde shortly before and about the same time that Edison was making his experiments with the electric railroad in America; Deprez motor; the electric candles of Jablochkoff, at that time so well known, and Jamin, and the Siemens la Soliel, Jasper, Crompton, Brush, Werdemann, Maxim and other arc lamps in infinite variety, and dynamo machines of the Gramme, Siemens, Edison, Brush, Lontin, Maxim and many other well known types. A room fitted up with telephones connected to microphones at the Grand Opera House attracted enormous crowds, and among the scientific men who visited the exposition much interest was manifested in the remarkable collection of works upon electricity and magnetism, the most compl te library in the world, which was exhibited by the owner, Latimer Clark.

Many of the exhibits at Paris were sent to London, to the Crystal Palace Electrical exhibition, which followed immediately thereafter in 1882, and while of very great importance, possessed comparatively few striking features, which had not been already shown in the Paris exhibition. Edison's magnificent display, which was the largest feature in the Paris exhibition, was added to and became the most prominent feature at this exhibition also, and as in the Paris exhibition the telephone occupied a very prominent place, Prof. Dolbear's electro-static telephone attracting particular attention, and this department vied with the extensive displays of arc, incandescent, and semi-incandescent lamps. The telegraph department was very complete, and among other interesting things shown, were Lord Kelvin's siphon recorder and Edison's automatic and autographic telegraph, which were also shown at Paris. A small electric railway carried passengers in the grounds.

At the Munich exhibition in 1882, the interesting experiments in electric transmission of power by Marcel Deprez, and in storage batteries, added considerable interest to the fine display of electric lighting, telegraph, telephonic and other experiments.

At the Vienna exhibition of 1883, was shown the electric launches driven by the storage battery, a fine display of electrically operated pianos, a series system of incandescent lighting with Bernstein lamps, and a most wonderful collection of dynamos, motors, arc and incandescent lamps, telephones, telegraphic systems, and a beautiful display of electro plating work. The Electrical exhibition held in the same year at the Aquarium in London brought out for the first time publicly the Gaillard and Gibbs transformer.

At the Turin exhibition in the following year this same system, which has now become so well known as the alternating current system, was shown on a commercial scale, and some elaborate tests were conducted, demonstrating its practicability and efficiency. Following this was the Franklin Institute Electrical exhibition held in Philadelphia in 1884, which, while considered an International exhibition, was largely an American exhibition, but of great interest and importance. The various large electric lighting companies made handsome displays and the telephonic interests were strongly represented, and Prof. Gray; William Wallace, and others made historical exhibits of very great interest; and one of the most interesting features was the efficiency test upon the various incandescent lamps shown at the exhibition. At this position was shown the first flashing tower of light composed of incandescent lamps, designed by the writer, which has since become so common at the different electrical exhibitions. The mammoth incandescent lamps of Weston and Edison, Edison's huge steam dynamo, electric clocks, the curious plating machines of Forbes and others, the different types of dynamos and new incandescent lamps, the Sprague electric motors, and a conduit system for electric railways were among the salient points of this exhibition.

The next important exhibition was that of New Orleans in 1885. The most interesting electrical features shown there were the immense plant constructed for the lighting of the building by the Edison incandescent light, and the Daft electric railway, and besides these there were the usual exhibits of telegraphic, telephonic systems and dynamos for arc and incandescent lighting and plating purposes. Electricity played a more or less important part also at the small exhibitions at Louisville and elsewhere, and at the Centennial exhibition of the Ohio Valley and Middle Atlantic states, held at Cincinnati in 1888, where was shown the largest display of electricity, producing novel effects as an attraction to an exhibition that had ever been produced in this country or abroad, and it is doubtful if a greater display has been made since, of electricity utilized in this particular manner.

The Paris exhibition of 1889 had many important electrical features. Among the most important were the personal exhibits of the inventions of Thomas A. Edison, the apparatus for experiments in induction and in alternating currents of Elihu Thomson, the electric welding system of the Thomson-Houston company, the electric railway system of the Thomson-Houston, Sprague and other companies, the huge direct current dynamos of the Oerlikon company, the various accumulator systems, and the extensive appliances for railway, telegraph and signaling purposes. The immense search lights, the largest which had been up to this time constructed, attracted a great deal of attention, and the high speed dynamos driven direct by the steam turbines received merited attention. The powerful permanent and electro-magnets and Deprez electric hammer were interesting features, the types of direct driven dynamos exhibited in the French, German, English and Belgian sections, and the huge incandescent dynamo exhibited by Edison and the alternating current machines of the Thomson-Houston company all attracted an enormous amount of attention and showed great advances in the art of dynamo construction.

Following this came the electrical exhibition of 1892, held at the Crystal Palace exhibition. This, although termed an International exhibition, was largely devoted to English manufacturers. It was very interesting to compare this exhibition with the Electrical exhibition held ten years previous, at the same place, both of which the writer had the pleasure of attending. The most interesting features shown at last year's exhibition were the high-tension experiments of Siemens Brothers and Messrs. Swinburne, the experiments, with alternating current apparatus of Elihu Thomson, the electric steam fire engine of Siemens Brothers, the improved forms of Plante storage batteries, the various types of electrical meters and testing instruments, Crompton's electric crane, the Kingdon inductor dynamo, Morday's alternating current machine, the handsome display of electric motors and methods of controlling the same, the Carpenter heating and cooking appliances, and the fine display of the Edison-Swan Incandescent Lamp company, and last but not least, the very interesting display of historical telegraphic apparatus by the British Postoffice Department.

This brings us about up to date on the most important of the exhibitions of the past, and to the threshold of what will doubtless prove the most remarkable exhibition that the world has ever seen, and let us hope that from an electrical standpoint, it may surpass in importance all the electrical exhibitions which have heretofore been of such incalculable interest and value, and in conjunction with which so many valuable discoveries and inventions have been brought to the attention of the public.

Varied Applications of Electricity.

By E. J. Spencer.

It was at the very beginning of exposition work that the Edison General Electric company obtained a contract for the furnishing of the temporary light and power plant for the exposition. By the fall of 1892 this plant had increased so as to call for four arc lighting machines, two 100 kilowatt 500 volt power generators and two low tension incandescent machines. From its installation until within a month this plant has done continued, incessant duty under the most trying circumstances of overload, of hastily improvised expedients and generally discouraging surroundings. A plant put in for the immediate needs of the time, it has continued many months beyond the originally estimated period of service. Although installation was of a temporary character, the service has been uniformly reliable and satisfactory. Many motors have been placed throughout the grounds and buildings of the exposition for hoisting, running saw-mills, pipe cutting machines and a multitude of other original applications that have reflected the greatest credit upon the ingenuity and the competence of the electrical and mechanical departments of the World's Columbian Exposition.

Thoroughly appreciating the service, the Exposition company has awarded the General Electric company the contract for furnishing motors from one to 100 kilowatts capacity for service of the World's Columbian Exposition during the year 1893. At the opening of the Fair there will be a multitude of motors, ranging in capacity from one to 130 horse power, engaged in all the varied service of this vast aggregation of wonders.

In the service lighting of the grounds and buildings the General Electric company will have an aggregate of 3,500 2,000 candle power arc lamps. The largest building of the exposition (manufactures) is lighted by the Thomson-Houston system exclusively, after designs prepared at the solicitation of the World's Fair under the direction of the General Electric company. These plans in all their studied detail reflect the greatest credit upon the noted lighting engineer, Luther Stieringer, who devised this novel method of even distribution of light; also upon the exposition's civil engineer who designed, contracted for and placed the structures requisite for this most difficult piece of lighting work. It is safe to say that the large coronas of the manufactures building are without a rival in the lighting art.

To the same master hand designing the lighting of the manufacturers and liberal Arts building is due the design of the great electric fountains, put in by the General Electric company at the west end of the grand basin, facing the administration building. These fountains, two in number, placed on the lower terraces on either side of the McMonnies emblematical fountain, are without a rival in ancient or modern days in hydraulic or electrical design. Supplied from the high pressure system placed for the fire protection of the World's Fair by the Worthington pump people, each of these two fountains requires for its own individual service the full capacity of a 16 inch water main under 100 pounds pressure. Located as they are upon the lower terraces, the necessity arose for operating casemates below the surface level of the lake. The successful completion of these water-tight casemates, with their floors seven feet below the level of the water in the adjoining lagoon, reflect the greatest credit upon the FitzSimons & Connell company, engaged upon this contract.

In illuminating these fountains the General Electric company had at its command the experience in projector work for the United States navy. Altogether, 38 of their 90 ampere projector lamps, with burnished silver parabolic reflectors, will, by their concentrated effort, illuminate in the most pleasing manner the ever varying streams of water projected through the nearly 400 apertures provided. The entire management of these fountains will be directed from the northeast tower of machinery hall. By means of the devices employed both fountains can be made to operate as one. For maintaining the light there will be used four 175 kilowatt Edison bipolar generators, the service to each fountain being on the Edison three-wire system, with lamps placed across the mains in parallel. After the close of the evening's entertainment the same machines will be used in charging the batteries of the electric launches. After five or six hours charging each little launch will have stored away in its hold about 40 horse power hours of effective electrical energy, sufficient for 10 or 12 hours continuous run. This charging station, located south and east of the agricultural building, is the most extensive ever put in in the United States, and probably in the world.

Upon the United States battleship Illinois the General Electric company will show its method of ship lighting and the distribution of electricity for general ship uses. Two standard naval direct coupled, iron clad generating sets will be located between decks. In all her fixtures, her side lights, mast head lights, binnacle lights, lights for cabin, for magazine, for coal bunkers and for all other purposes aboard ship, the appliances of the company will be shown. Here also will be actively displayed several of its search light projectors; one of the largest projectors ever made in the United States, or even in the world, a 150 centimeter projector with a 200 ampere lamp.

Of the intramural railroad, suffice it to say that this most interesting and most valuable demonstration of the applicability of electricity to high speed interurban service is looked upon with the greatest interest throughout the country. The freedom from smoke and dust, from smell and discomfort, from overwrought sympathies at brutal treatment and overloading of sensate animals, together with the attendant comforts of well lighted and cleanly cars, will do more to assist in the popularizing of surburban life than any advance thus far made in the science of transportation. The flexibility and reliability of its system, the easy extension of carrying capacity

without a diminution of schedule time due to overloading of engines, the easy extension of capacity without consideration of limits of strength of structure will all be arguments in favor of electric traction strongly appealing to those most interested in elevated railway service.

It was about a year ago that the attention of the companies now forming the General Electric company was directed toward the Columbian Exposition and the chance afforded thereby of displaying in competition with the world the advances made in electrical development by American manufacturers. It was then that application was made for allotment of space of exhibit in electricity building. Due to numerous partial pledges by the department of electricity and the consequent necessity of effecting several mutual transfers in space alloted, it was late in the fall before the assignment of space as now possessed by the General Electric company was made in its favor. This final assignment of space gives to the company the central spaces of the building. These spaces are five in number. In the very center of the building is a space 34 feet in diameter where the General Electric company has erected a beautiful shaft which, with its decorations of thousands of incandescent lamps, will be an appropriate central feature of the electrical exhibit of the exposition. The entire length of transept, from the east door to the west door, has been assigned to this company, together with the spaces in the nave similarly situated and immediately adjoinig the center. On either hand, immediately under the galleries, the spaces adjoining the central areas have also been given to the General Electric company, thus securing for its exhibit the entire central space of the electricity building, comprising over one-quarter of the ground floor of this building, and fully one-seventh of the entire exhibit space available.

But this is not all; for in the contract for arc lighting, for motor service, for the great electric fountains, for service to the electricity building, for the charging of the storage battery launches, for the equipment of the Intramural railroad, for the equipment of the United States battle ship and for search light projectors sweeping the entire horizon, the General Electric company has acquired at the World's Fair business interests far exceeding the purely exhibition features.

As for the exhibit in the electricity building proper, it scarcely need be said that nothing of modern useful application of electricity to service has been overlooked by the General Electric company, and all these applications will be illustrated, in fact or in photograph, within the area of this exhibit. In the one space stands the "Jumbo," the first instance of a direct coupled engine and dynamo. Showing the crudeness of the early days of its design, it still surely pointed the way to the modern type of dynamo with direct coupled compound or triple expansion engine with efficiencies approaching the possible limit, and capacities of titanic extent. This exhibit is loaned by the New York Illuminating company, in whose Pearl street station the machine has done service for eleven years. In the same space will be shown the incandescent lamp of every type and voltage; and the only comprehensive system of distribution by feeders and mains. In the east center space will be shown the alternating system with all its devices and in all its possibilities. Across the center aisle its offspring, the multiphase system, will appear in another exhibit. The application of electricity to marine service by high speed engines directly driving small compact highly efficient dynamos, the search light projector, and the dock and marine hoist, the uses of electricity in pumping, its perfection in devices for signalling at sea, will also be shown. The various applications of electricity to the needs of the miner and the perfected systems for the transmission of power over long distances will also be evidenced; the standard motor and motors applied to locomotives, to derricks, to elevators, will also be shown. We must not omit the display illustrative of the development of street railway service nor the generators that up to a short time ago would have been considered as impossible creations.

The model arc lighting plant, rendering the service lighting for the electricity building, will be in one location, and last but not least, the incandescent lamp in all its decorative and service phases will be most lavishly used.

Expositions have become more and more extravagant in expenditure and exhibitors have spent more and more of time and money in the attractive placing of perfected exhibits before the public eye. The Columbian Exposition is no exception to this rule. The grounds and the buildings are marvels of creative genius. The exhibits, particularly the electrical exhibits, will be equally excellent. Fortunate the man whose privilege it will be to have sufficient time for a proper enjoyment of the beauties of the World's Columbian Exposition, and especially fortunate he, whose time is at his command and whose training is such as will enable him to benefit to the fullest extent by the opportunity for study offered by the electrical exhibits at the World's Fair.

Commercial Advancement of Electrical Interests.

By W. H. McKinlock.

The commercial side of the electrical industry can really be confined to little more than a decade. When Alexander

Graham Bell exhibited his electric telephone at the Centennial Exposition at Philadelphia in 1876, there were a few manufacturers in the country making medical batteries, telegraph instruments, the fire alarm telegraph, electric bells and burglar alarms. Everyone knows that outside of the manufacture of telegraph instruments (which was controlled by a few factories) the electrical business as a commercial problem was not considered a factor and hardly, if any, attention was give to it. None but the very best of hotels could pay the prices demanded for electric bells, and only the very wealthy could afford the luxury of a burglar alarm; therefore, the production was limited.

The public did not take kindly to the telephone at first, and it came into favor grudgingly. It was 1880 before it could be said that its success was assured. The manufacture of the special devices used in connection with the telephone was performed in a circumscribed manner, and naturally fell to the lot of factories already equipped and having some experience in electrical matters. Nearly or quite contemporaneous with the telephone, the electric light appeared. The growth of the electric light may be said to resemble in part, "Jonah's gourd," maturing in a night. The business was found highly profitable, capital was attracted to it, new factories were started to supply the demand that seemed insatiable, the larger cities adopting it with avidity and the smaller ones following in their steps as rapidly as they could be supplied. The constant changes made necessary by the lack of understanding and requirements of the business and the rush and hurry to take orders by the manufacturers supplying their particular system or systems created a new industry, which is now commonly known in the trade as the "supply house."

The growth of the supply house must necessarily be commensurate with the growth of the general business, and commercially, it is looked upon to-day as a large factor of it. There are millions of dollars invested in these various enterprises throughout the country, and while the business is not considered a technical one, still it is necessary to have a fair knowledge of the general appliances and to know the requirements of the trade, together with a good business training and sufficient capital to conduct a house of this character with profit. At this period capital is no inconsiderable element as a component part of a successful supply house.

The supply house is designed to be a place where the station manager can send for a screw driver or an extra dynamo, where he can get his pound of magnet wire to repair a burn-out, or miles of wire, poles, cross-arms, pins, brackets, lag bolts, and step irons, to construct a new circuit. He has come to recognize the supply house the same as a house-keeper does her groceryman, and buys simply his daily needs. A well conducted supply house is supposed to carry all the materials, with the exception of the main machines, in stock, and in quantities, too, to meet any demands that are made.

The supply man has had much to do with perfecting the electrical business in general, competition having made it necessary to develop articles of merit and superiority if his particular house is to enjoy any advantage in the trade. In this way they have perfected, and have had perfected, numerous auxiliary appliances that have augmented the uses of electricity, in the house, store, railway, steamboat, factory and otherwise.

The progress of the electric railway has given a new impetus to the business and has enlarged its scope, developing its resources and giving a new and vital element to its character. The wide-awake supply man often can and does supply to the engineer and expert ideas and opportunities for the better carrying out of his plans, for he is obliged to keep himself posted on every new thing that is brought out, and generally tests its merits before offering it in the market.

Much has been said about the progress of the electrical industry, but very little, if anything, with reference to the supply business, and yet a review of its short history is fully as wonderful, if not more so, than any other single feature or branch of the electrical industry as a whole.

What development it can show at the World's Fair, which now is upon us, can hardly be appreciated, as it can only be looked upon in the aggregate. In 1880 there was an approximate capitalization of supply dealers and manufacturers of supplies of about one million dollars, with possible annual sales amounting to twice that amount. At the present time, at a low, conservative estimate, there is forty millions invested in the supply business, and manufacturers of supplies that do a business of three times that amount. These figures do not include manufacturers of wire nor patented articles, but represent the manufacturers and dealers of apparatus that is auxiliary to the general business, and to such as is dealt in universally by supply houses.

The decade we are now in bids fair to rival the one preceding it, if not entirely surpass it. The electrical congress that is to be held during the fair will mean a good deal to the supply people, and will no doubt settle many mooted questions respecting the technique of the business. The practical application must necessarily fall upon the workers, and the appliances, to some extent, must be worked out by these men, assisted in a great measure by the experienced supply man.

To those who will give some thought and study to the electrical business the phrase so often heard, that the business is "still in its infancy," must appear ridiculous. Any business with a billion dollars invested in it must be something more than an experiment, and the electrical business as a whole has reached this basis. If one should attempt to estimate the future by the past, he would require to have an unusually imaginative mind, and yet, we should soberly judge the future by the past, and estimate ourselves judicious in so doing.

Electric Launches on the Lagoons.

By C. H. Barney.

A novel means of transportation, and one that will prove a most attractive feature of the World's Columbian Exposition, will be the fleet of fifty electric launches, which will make regular trips over a course of about three miles on the lagoons and other interior waters at Jackson Park. The plan of water connection was first conceived by Frederick Law Olmstead, the landscape architect of the exposition. These boats will run from 8 A. M. until the fair closes at night, and the landings on the course will enable passengers to get on or off at any of the buildings or other points of interest, thus affording means of communication between different parts of the grounds, as well as a most delightful method of obtaining a general view of the magnificent buildings which front on the lagoons and canals.

The course to be taken by the launches will be from the north side of the agricultural building along the south side of the manufactures building, thence up the north canal through the east lagoon, turning into the north inlet, passing the fisheries building to the clam-bake landing, thence back again through the inlet and into the north lagoon to the fine arts building, and from there returning down the west lagoon and north canal to the starting point. The landings will be as follows: Agricultural building, north side; liberal arts building, south end, southwest corner and west centre; government building, north side; fisheries; clam bake; Illinois state building; woman's building; horticultural building; transportation building; mines and mining building; electricity building, northeast corner and southeast corner. The round trip will occupy about fifty-two minutes. When a launch returns to its dock at the charging station from its forty miles run, the work of charging is begun in less than one minute by an independent switch board connected to feeders from large dynamos in machinery hall. For the ten to twelve hours run a charge of five to seven hours at an average rate of 15 amperes will ordinarily recharge the batteries. The boat shed and charging station will occupy the east and south sides of agricultural annex.

As may be supposed, the competition for this valuable concession was very great. Several concerns were bidders, and each of them was required to build a boat to be submitted to trial tests during the months of June and July last, to determine which class of craft was best suited to fulfill the requirements of passenger traffic on the exposition waterways. Steam, naphtha and electric launches were tested, and the electric boat Electra, owned by the Electric Launch & Navigation company of New York, was declared the best suited for the work.

The general dimensions of the boats to be used will be 35 feet 10 inches in length over all, with a beam of 6 feet 3 inches and a draft of 28 inches. They will seat comfortably about thirty passengers each. The motive power will be furnished by storage batteries, manufactured by

the Consolidated Electric Storage company, and motors especially designed and constructed by the General Electric company. The batteries and motor are placed beneath the seats and flooring, so that the utmost carrying capacity of the boats can be utilized. These launches are, of course, absolutely free from smoke, grease, offensive odors and vibration. The boats will be carpeted with perforated rubber mats, with a solid canvas backing to catch all dirt and water. The cushions are of leather, stuffed with hair. The awnings and side curtains are striped orange and black, pattern and color selected by F. D. Millett, director of colors. For the use of officials, the exposition has purchased four boats, similar to those in regular service, but with decks and interior more highly finished and having different colored awnings.

Each boat in actual daily operation during the fair will cover on an average forty miles a day, with one charge. The total mileage per day for the fifty launches will therefore aggregate 2,000 miles, or more than the distance from New York to Chicago and back each day.

The normal speed—all that is allowed by the World's Fair—is six miles per hour. A speed of eight miles per hour is, however, attainable on emergencies.

In the equipment of these launches a 4 horse power motor is directly connected with the propeller shaft. The speed of the motor is controlled by means of a lever within easy reach of the pilot. For regular service such as that required at the exposition, where moderate speed is desired, the batteries are grouped either in two or three divisions. In the latter case twenty-six cells are connected, giving 42 to 45 amperes at 52 volts. The other grouping consists in putting the 78 cells in each launch in two groups of 39 cells in series, giving about 55 amperes at a pressure of 78 volts. This grouping is adopted to prevent too rapid discharging of the batteries and to give a steady and continuous current to the motor.

The officers of the company are: President, Henry Steers; vice president, E. J. Moore; secretary and treasurer, Alfred Skitt. The officers in immediate charge of the operation of the concession on the grounds are: General manager, C. D. Wyman; superintendent, C. H. Barney; electrical engineer, R. N. Chamberlain.

Illustrated Features.

The illustrations presented in this number of the WESTERN ELECTRICIAN will give an excellent idea of the principal electrical features of the World's Fair and some of the men who have been prominently identified with the project. They will materially aid the visitor in studying the electrical part of the great exposition. A full page portrait of Prof. John P. Barrett, chief of the department of electricity, is presented as a frontispiece. It is an excellent likeness of the man who will occupy the most prominent position among the electrical fraternity of Chicago during the exposition.

Views of the electricity building are presented on pages 228 and 229, showing the progressive steps in the erection of the structure. The first three cuts are reproduced from the WESTERN ELECTRICIAN of May 3, 1891, February 9, 1892, and September 3, 1892. The first of these is a perspective view, prepared for this paper, which was adopted by the department of publicity and promotion, and reproduced in newspapers and magazines in every part of the country. Following this is a photographic view of the building as it appeared nine months later, when the great steel arches had just been placed in position. The third illustration shows the appearance of the building last fall, just before the dedicatory exercises. The fourth and last view of the building is from a recent photograph showing the structure complete.

A map of the central portion of the city, in which a majority of the electrical concerns are located, is presented on page 230, and two bird's eye views of Jackson Park, one from the lake and the other from Hyde Park, are given on pages 238 and 239.

Diagrams showing the arrangement of space in electricity building are presented on page 232. These plans are from the latest official records, and the assignments shown may be taken as final.

On page 226 is a useful map showing the location of all the principal electrical features on the grounds. By its aid the visitor can readily ascertain the location of any display he may be particularly desirous of seeing.

The beautiful illustration on page 227 is a reproduction of the latest photograph of machinery hall, and shows this handsome building to advantage.

A plan of the power plant in machinery hall is shown on page 240. The drawing shows the southern portion of the main building and the southeastern corner of the annex, within which the electric lighting and power machinery is comprised. This great plant has heretofore been described in detail in the WESTERN ELECTRICIAN, but the following recapitulation will be of service:

Boilers—Root, 1,500 horse power; Gill, 1,500 horse power: Heine, 3,750 horse power; National, 1,500 horse power; Campbell & Zell, 3,750 horse power; Babcock & Wilcox, 4,500 horse power; Stirling, 1,500 horse power.

Engines—Ball (1), 480 horse power; Armington & Sims (1), 400 horse power; Edison (1), 1,000 horse power; Phœnix (3), 1,000 horse power; Allis (2) 2,500 horse power; Woodbury (2), 1,075 horse power; Ide (2), 425 horse power; Bail & Wood (5), 800 horse power; Fraser & Chalmers (1), 1,000 horse power; McEwen (1), 220 horse power; Westinghouse (9), 7,000 horse power; Buckeye (6), 1,850 horse power; Atlas (2), 1,500 horse power; McIntosh & Seymour (1), 1,000 horse power; Russell (2) 725 horse power; Lane & Bodley (3), 800 horse power; Bass (1), 224 horse power; Watertown (1), 250 horse power; Skinner (2), 400 horse power.

Dynamos—Edison (6), 1,800 horse power; Eddy (4), 1,000 horse power; Westinghouse (20), 120,000 incandescent lights and 500 horse power; Mather (4), 800 horse power; C & C. (6), 600 horse power; Brush (16), 960 arcs; Fort Wayne (14), 840 arcs; Standard (20), 1,000 arcs; Thomson-Houston (26) 1,300 arcs; Excelsior (6), 300 arcs; Western Electric (10) 500 arcs.

A fine illustration of one of the arc light coronas in the manufactures building, alluded to in the articles by Messrs. Pierce and Spencer, in this number, is presented in the full page picture on page 241. This is one of the four smaller coronas and is in the southern end of the building. From it are suspended 78 arc lamps.

Three illustrations represent portions of the great Westinghouse incandescent installation. That on page 237 shows the 2,000 horse power quadruple expansion A lis engine and the two 10,000 light alternators to which it is belted. The engine shown in this picture is the largest in the service plant and is the one set in motion by an electrical connection made by President Cleveland on Monday, from his position in the stand in front of administration building. The engine and dynamos are surrounded by a platform three feet above the flooring of machinery hall, 62 feet long and 37 feet wide. The engine has cylinders 26, 40, 60 and 70 inches in diameter. The stroke is 12 feet. The fly-wheel is 30 feet in diameter, with a face of 76 inches. The dynamos are driven in tandem, the longer belt being 186 feet in length and the shorter 149 feet. These belts were made by the Page Belting company. The handsome Westinghouse switch board described by Mr. Keller is shown on page 231 and a Westinghouse 1,000 horse power engine directly coupled to a 10,000 light alternating current dynamo on page 230.

Undoubtedly the electric fountains designed by Mr. Stieringer will be one of the most attractive features of the exposition. A view of the northern one, from a photograph taken a few days ago, is presented on page 234. It shows the basin and piping. The southern fountain is a counterpart of the one shown. Mr. Spencer, in his article on "Varied Applications of Electricity," gives some interesting facts about the fountains.

"Jumbo" the historic directly connected engine and incandescent dynamo shown in process of rehabilitation on page 233 is the pet of the Pearl street station in New York, where the machine is looked upon almost as an animated being and regarded as an old and trusted friend. It belongs to the Edison Illuminating company of New York, and is merely loaned to the exposition. Such is the attachment that is felt for the veteran that the officials of the company are reported to have declared that the machine could not be purchased at any price. It is said that when the decision was reached to take the machine apart and ship it to Chicago for exhibition many of the employes came up and patted the old-fashioned magnet coils with a husky, "Good-bye, Jumbo." The machine is fourteen years old and has been eleven years in continuous service. So rapid has been the advancement in electric lighting machinery, however, that it has long been regarded as of an antiquated type. But "Jumbo" has a record of faithful service that easily accounts for the fact that it is regarded with a feeling closely akin to affection. Wonderful stories are told of the machine running in three feet of water and of its unmurmuring service to almost any degree of overload. The engine is rated at 140 horse power, but the intimates of "Jumbo" assert that 2,460 16 candle power incandescent lamps have been run from it. The field coils are placed horizontally, eight above and four below the armature, which is of the Siemens type. The dynamo presents an odd appearance when compared with the machines of to-day, but it is most substantially constructed, and bids fair to make glad the hearts of its admirers by many years of continued usefulness. "Jumbo" was one of eight similar machines installed in the original Pearl street station, the first incandescent central station of any magnitude in the world. In its eleven years of continuous service it has averaged five hours a day, with never a skip or break-down. It is no wonder that the admirers of the machine are proud of its record. A machine of this type was exhibited at the Paris electrical exhibition of 1881, where it created a great sensation. "Jumbo" occupies the place of honor in the space in electricity building devoted to Mr. Edison's personal exhibit, and is in charge of W. H. MacKay of the Edison Illuminating company.

The greater part of the arc lights for the general illumination of electricity building will be supplied by the General Electric company, and a view of the plant is shown on page 235. Power is supplied by a 150 horse power Edison motor sunk below the level of the floor, as shown in the picture. Current is taken from 220 volt circuits supplied by Edison multipolar generators in machinery hall. In the plant are nine arc dynamos—eight Thomson-Houston machines, varying in size from fifty-lighters to a little ten-light machine, and one fifty-light Excelsior. The switch-board is arranged for but six machines, however, and some of the machines will not be operated under load. Two of the dynamos are belted directly to the motor, and the others to a countershaft running under the floor.

BOOK TABLE.

THE THEORY AND PRACTICE OF ABSOLUTE MEASUREMENTS IN ELECTRICITY AND MAGNETISM By Andrew Gray, M. A., F. R. S. E., Professor of Physics in the University College of North Wales. 2 Vols. Volume II. Parts 1 and 2. London and New York: MacMillan & Co., 1893.

The brothers Thomas and Andrew Gray have both been assistants to Sir William Thomson at Glasgow, and are therefore in a position to write authoritatively upon many of his methods. The former, now professor of dynamic engineering at the Rose Polytechnic Institute at Terre Haute, Indiana, was, at the time of a visit of the writer to Glasgow, carrying out an extended series of calibrations of Sir William Thomson's new standard balances by determinations of copper in sulphate of copper volt meters. This work was so thoroughly done that his methods and results have formed the standards for sulphate of copper electrolysis ever since. A very full account of them is given in the second of these volumes.

The first volume of this series was issued in 1888 and at once took rank as a treatise on electrical measurement possessing high and unique value, inasmuch as it not only dealt mainly with the more difficult measurements, such as inductive capacity of dielectrics, resistance of electrolytes, calibration of standard wires, the standard ohm, etc., but also gave a solid body of theory, wherein the appropriate mathematics were freely used, but with great clearness and detail. In this way much of the mathematics from Sir William Thomson's "Reprint of Papers on Electricity and Magnetism," and also Clerk Maxwell's volumes was brought in, but in such connection with their experimental applications as to remove almost entirely their abstract and seemingly ideal character when given alone. The electrostatic theory of condensers and cables was given in particularly thorough form, so that a student only partially acquainted with differential equations could nevertheless, by attentive reading, get a good idea of electrical waves along a cable, retardation, distortion of signals, etc. After a long wait ing and much expectation we now have the final installment of this admirable work, in the shape of a volume larger than the first, but for convenience divided into two parts separately bound. The first part of Volume II., with the exception of the author's practical method for the determination of H, is entirely theoretical, but none the less valuable in its place. Much that is given in Clerk Maxwell, or in Mascart and Joubert, somewhat dryly, or in too brief form, is here very clearly, fully and logically presented. In particular, Clerk Maxwell's treatment of the magnetic action of coils and their self and mutual inductance, and the conception of the geometric-mean-distance is enlarged and by including the work of Mr. Macdonald of Clare College, Cambridge, on this latter subject, is made more practically valuable. For example, in addition to Maxwell's results on the geometric mean distance of lines and surfaces, we have others which are now of especial practical value in deciding the arrangement of wires or strips in cable cores, which shall give the least inductive retardations, etc., a question on which the actual relative market values of many proposed forms of underground cables will have to depend. In the calculation of the coefficients of self-induction of coils, we regret that the cases treated are, as usual, the ones where the radii of the coils are large compared with the dimension of the cross section of the windings, whereas the most commonly occurring cases in practice are apt to be just the reverse. On this point we have found a great dearth of theoretical treatment, and in most cases arising in our own experience have had to go to the bottom of the matter by fundamental original treatment, regardless of the books.

Had the the second part of Volume II. been published two or three years ago we should have saved ourselves very much labor in our laboratory work. This remark applies especially to the first portion of the book. Nowhere is there published so good a collection of recent methods for determining by laboratory processes coefficients of self and mutual induction, and comparisons with capacity. In fact, a great deal of this matter we had already been compelled to glean from various sources and put in mimeograph sheets before our students for laboratory use. The discussion of the principles involved in these determinations is particularly full and clear, and in our opinion no

work is better to train a student in careful manipulation, and in thorough understanding of electrical principles than these chapters of Dr. Gray on the measurement of inductances. For the mere practical work of finding inductances where they must necessarily be known for commercial reasons, and known for definite periods of current change as well, alternating current methods are doubtless the best. Mr. Steinmetz, among others, has given us simple methods, leaving but little to be desired; but as stated, for laboratory training in steady current methods and principles, it will be hard to surpass these sections of the second part of Gray's volume two. To those not having access to, or not caring to consult, the original papers, the rest of this second part will be very valuable, for it gives in detail the experimental determinations of the ohm and other units in absolute measure as given by Rowland, Lorenz, Thomson and others. There is a good account of all the methods, showing in full the experimental methods adopted, and the theories of the methods. A very full account is given of Sir William Thomson's standard balances and the mode of calibrating them, of the Rayleigh form of Clark's standard cell (we are sorry to find no account of Carhart's form of this cell, which we know by extended use to be an excellent and durable one, and we think more stress ought to be laid on the necessary constancy of the battery used in supplying the current for Rayleigh's experiment), of the best forms of galvanometers and their calibration by electrolysis, of magnetic induction, alternating currents, and finally of electrical oscillations, induction, and the experiments of Hertz.

It may be claimed by many that in a treatise devoted expressly to measurements in electricity and magnetism, so much theoretical matter shou'd not have place; but many years' experience as a laboratory instructor in electricity and magnetism leads us to a contrary conclusion. It is almost impossible to get some students to give theoretical matters their proper attention, especially when of a mathematical character, unless in connection with some practical applications in which they can be interested and can understand. We know how often this is true, even of maturer minds, and the full force of an abstract principle can sometimes only in this way be clearly apprehended.

We are glad to see Prof. John Perry's table of the first seven zonal harmonies appended, as well as a short discussion of their theory. This will greatly facilitate a better understanding of many of the most important parts of the work. We wish that a large use of this important treatise might be made by the advanced classes in our American colleges. It will fill a place which no other single treatise can. JOHN E. DAVIES.

PERSONAL.

J. H. Carson, president of the Sterling Car Heating & Lighting company, New York, has been in Chicago for several days. Mr. Carson is introducing street railway supplies of all kinds in the West, and reports that much interest is aroused in the new type of Sterling fare registers used quite extensively in the East.

P. H. W. Smith, formerly of the Field Engineering company, Buffalo, N. Y., has been appointed superintendent of construction of the western division of the Standard Underground Cable company. Mr. Smith, whose office will be located in the Rookery building, Chicago, has the advantage of a wide experience in his line of business, and is peculiarly well fitted for his position.

William W. Nugent, 823 Home Insurance building, Chicago, has been appointed western manager of C. & G. Cooper & Co., manufacturers of Corliss engines, Mt. Vernon, O. Mr. Nugent's extended and varied experience as engineer and agent of well known firms will doubtless be of great service to him and will enable him to give considerable prominence in this section to the name of his company.

L. H. Rogers, of Boston, has recently been appointed assistant general manager of the Brush Electric company, Cleveland. Mr. Rogers some years since was connected with the eastern offices of the Brush company. Subsequently he became connected with the General Electric company, of Boston. Mr. Rogers was also for some years connected with the Electric Accumulator company. He has had a large experience in the electrical business and will be a valuable officer for the Brush company. Mr. Rogers is well known as the originator and owner of the Mt. Washington search-light, which he placed on the summit of the mountain last summer. He has recently been experimenting with this search-light with a view of throwing intelligible words and characters long distances and he has succeeded in utilizing the clouds as a screen for this purpose.

NEW INCORPORATIONS.

Brott Electric Rapid Traosit Bicycle Railway company, Alexandria, Va ; capital stock, $300,000; to operate Brott bicycle railways.

Arverne & Rockaway Beach Electric company, Arverne-by-the-Sea, N. Y.; capital stock, $50,000; to manufacture and use electricity for light, heat and power.

Golden Gate Manufacturing company, New York, N. Y.; capital stock, $600,000; to manufacture and sell hardware, woodenware and electrical goods.

Electro Construction company of Virginia, Richmond, Va.; capital stock, $25,000; to construct and utilize electric and other machinery, heat power and light, etc.

Oshkosh Telephone & Electric Service Exchange, Oshkosh, Wis.; capital, stock $50,000; constructing and equipping a telephone system; Hume & Oellerich, Oshkosh, Wis.

Indianapolis & Martinsville Electric Railway company, Indianapolis, Ind.; capital stock, $50,000; constructing, owning and maintaining a railroad commencing at Indianapolis and running through Marion, Johnson and Morgan counties to Martinsville, Ind.; B. C. Stevenson, Indianapolis, Ind.

Milford Light & Power company, Milford, N. H.; capital stock, $80,000; to generate light and power with electricity in Milford and vicinity; R. N. Wallace, Milford, N. H.

Las Vegas Light & Fuel company, East Las Vegas, N. M.; capital stock, $100,000; to generate and sell electricity and to manufacture and sell gas; E. D. Bullard, East Las Vegas, N. M.

Indiana Electric Power company, Goshen, Ind ; capital stock, $300,000; to construct, maintain and operate electric street railways and to furnish power for same and other purposes; Lew Wanner, Goshen, Ind.

Crouch Electric Supply company, Portland, Ore.; capital stock, $100,000; to manufacture, build, own, buy, lease or sell electric machinery, appliances and equipments; S. L. Lovell, Portland, Ore.

Woodbridge & Sewaren Electric Street Railway company, Woodbridge, N. J.; capital stock $50.000; building, constructing, equipping, operating, running, managing and maintaining a street railway.

Electric Steam Generating & Power company (incorporated in W. Va.), 29 Broadway, New York, N. Y.; capital stock, $500,000; generating steam by electricity, etc.; Woodward & Mayer, New York, N. Y.

Copenhagen Automatic Fire Alarm company, Chicago, Ill.; capital stock, $50,000; to manufacture and sell thermostatic devices and electrical machinery, supplies and devices; Ross & Todd, 185 Dearborn street, Chicago, Ill.

American Fuel Economizer & Engineering company, Jersey City, N. J.; capital stock, $30,000; to manufacture and sell electrical appliances for economizing fuel and other machanical contrivances, etc.; Wilson & Wallace, 48 Wall street, New York, N. Y.

Electric Manufacturing company, Charleston, W. Va.; capital stock, $10,000; to manufacture electrical and surgical instruments and other appliances to operate telegraph and telephone lines, e c ; Lionel J. Noah, 18 Broadway, New York, N. Y.

Madisonville & Cincinnati Street Railway company, Madisonville, O.; capital stock. $100,000; constructing and operating street railways in Cincinnati and Madisonville, to be operated by electric or other motive power; Burch & Johnson, Cincinnati, O.

Cleveland Electric Railway company, Cleveland, O., capital stock, $12,000 000; consolidation of the Cleveland Electric Railway company, the Brooklyn Street Railroad company and the South- Side Street Railroad company; Squire, Sanders & Dempsey, Cleveland, O.

South Waukegan Electric Railway company, Shields, Ill ; capital stock, $100,000; to construct and operate electric street railways in the townships of Shields and Waukegan, Lake county, Ill.; Morris, Ganse & Craig, 1302 Chamber of Commerce, Chicago, Ill.

General Construction company of Illinois, Chicago, Ill.; capital stock, $300,000; constructing railways, water ways and works, canals, light, heat and power plant, railway and street car; doing all kind of public and private improvements; Aldrich, Payne & Defrees, Home Insurance building, Chicago, Ill.

ELECTRIC LIGHTING.

An electric light plant is being put in at Trenton, Tenn.

Flandreau, Dak., will put in an electric lighting plant during the coming summer.

The question of lighting the streets of Little Valley, N. Y., with electricity is being agitated.

Bonds to the amount of $50,000 will be issued by the town of North Attleboro, Mass , to pay for the erection of an electric lighting plant.

The Hyattsville Electric Light, Heat & Power company has been organized to put in an incandescent electric light plant at Hyattsville, Md.

Toronto, Ont., has sold its electric light plant, and hereafter the city will be illuminated by the Toronto Incandescent Light company.

It is said that during the last four years there have been installed in Louisville, Ky., some sixty or seventy isolated incandescent electric light plants.

The Water Works & Gas company of London, O., will ask for a right of way to erect poles on the streets with a view of lighting the city with electricity.

The authorities of New London, O., have awarded the contract for an electric light plant in that place to the Howe Construction company of Newark, O.

H. R. Leavens, T. S. Coolidge, M. O. Brown and E. B. and O. S. Potter, of Glens Falls, N. Y., are projecting a scheme to build a dam across the Hudson River 30 feet high, put in an electric plant, and supply the villages of Glens Falls, Sandy Hill, Fort Edward, Gansevoort, Fort Ann, Saratoga and other neighboring places with electricity for power and lighting.

ELECTRIC RAILWAYS.

An electric line is proposed to connect Santa Barbara and Montecito, Cal.

The city council of Columbus, O., has granted permission to the Columbus Street Railway company to extend its tracks on Naghten street, from Cleveland avenue to Neil street.

An Electric Railway between Red Bank and Long Branch, N. J., is contemplated.

The right of way for an electric line in North Alton, Ill., has been granted by the council.

The construction of an electric railway between Toledo and Maumee, O., is contemplated.

A street railway to connect the public square, depots and fair grounds of Bloomfield, Ia , is projected.

The Pacific Railway company of Los Angeles, Cal., has asked to be allowed to operate its road by electricity.

The Owego, N. Y., Electric Railway company, contemplates the construction of an electric railway to Hiawatha Island.

A company composed of New York capitalists has been granted a franchise for an electric street railway in Hagerstown, Md.

The Barnes Heights and Cornell Mountain electric road, Portland, Ore., is now in successful operation. It is three miles long.

The Wakefield & Stoneham Street Railway company, Wakefield, Mass., proposes to extend its lines and equip them with electricity

The Bay City, Mich., Consolidated Street Railway company will extend and improve its lines, having issued $500,000 in bonds for that purpose.

The electric railroad between Buffalo and Williamsville, N. Y., which has been in the process of construction for some time, was formally opened April 4th.

The Phœnix Electric Street Railway company, of Phœnix, Ariz., is to extend its tracks one and one-half miles. The foundation has been laid for a power plant.

The Wiston Electric company of South Milwaukee, Wis., has secured a franchise for erecting an electric light plant in South Milwaukee, the cost of which will be $25,000.

John Cross is asking the city council of Pasadena, Cal., for a franchise over the streets, and contemplates building an electric street railway between Los Angeles and Pasadena.

The Capital electric railway, of Baton Rouge, La., was opened to the public April 5th with appropriate ceremonies, including the driving of a silver spike by President B. F. Mayer.

President Kilgour, of the Consolidated company, Cincinnati, O., says that the company will put on two hundred open cars this summer and change existing horse lines to electric.

The Buffalo & Niagara Falls Electric Railway company, Buffalo, N. Y. (capital stock, $1,000,000), has been incorporated to construct a street surface railroad to be operated by electricity.

The Indiana Electric Power company has been granted a franchise for building and operating an electric street railway in Goshen, Ind. The company will run independent lines to Elkhart, ten miles distant.

Efforts are being made by the Thomson-Houston company, through legal proceedings, to obtain possession of the electrical equipment of the San Francisco & San Mateo electric railway, San Francisco, Cal.

The Millville, N. J., Street Railway company have been formed with a capital stock of $20,000, to build a trolley line two miles long in Millville, and as soon as possible to extend it to Brighton, ten miles distant.

The City Park Railway company, Denver, Colo., has been granted the right of way on several streets of the city to construct and operate a street railway with electricity, gas or compressed air as the motive power.

The Phœnix Electric Light & Power company has bought the plant of the Electric Light company of Los Angeles, Cal. A number of additions will be made at once to the plant, a new 1,000-light dynamo and two large new boilers have been placed, and provision made for arc lights and also power for electric fans and machinery.

TELEGRAPH.

It seems probable that telephonic connection across the sound between Malmo on the Swedish and Copenhagen on the Danish coast will soon be an accomplished fact. As Malmo is already in telephonic connection with a number of places in Western Sweden, and with all of the state telephones and Stockholm, this new international line should prove of great practical importance. Experiments have shown that an already existing reverse cable across the sound, jointly owned by Denmark and Sweden, will answer the purpose, and that its connection with the state telephonic system in Sweden is sufficient to ensure a perfectly efficient telephonic connection between the Swedish and Danish capitals.

MISCELLANEOUS.

W. F. Fife is interested in an electric smelting plant proposed for Tacoma, Wash.

The Edison Electric company of New Orleans, La., has been incorporated with a capital stock of $500,000.

The Folsom Electric Light & Power company will erect a long distance power transmission plant from Folsom to Sacramento, Cal.

The West Michigan Electric company has commenced

work on the dams of the water power at Lowell, Mich., which are to be used for transmitting electric power, and which power it is proposed to retail in Grand Rapids for light, manufacturing and other purposes. The dams are to furnish 3 000 horse power, which will be generated through the medium of horizontal water wheels.

E. M. and W. Ferguson, owners of the Ferguson block, Third avenue, Pittsburg, Pa., have entered suit to recover $7,798 96 from the Edison General Electric company. The defendants contracted in 1891 to fit up the new building with engines, dynamos, etc., at a contract price of $7,900, on which they paid down $5,530. In addition it cost over $2,000 to prepare the building for the work. It is alleged that the work is not satisfactory; that it was not done according to contract, and that it will have to be taken out.

TRADE NEWS.

C. E. Lee, who has been well known for some time as the Chicago representative of the Electric Gas Lighting company, has removed to 65 Lees building, 149 Fifth avenue, Chicago, where he will continue to carry in stock the Samson battery as well as other fine specialties.

The Bridgeport Machine Tool Works, Bridgeport, Conn., is making a specialty of its boring and turning mills. This company has recently enlarged its works and added many special tools and fixtures for making and handling heavy machines and is now fully equipped to meet the demands made upon it.

Taylor, Goodhue & Ames, manufacturers and dealers in electrical material, have just moved into their new store, 548 Dearborn street, Chicago. This firm has earned a well deserved reputation from its Century line wire and insulating materials in which it is an extensive dealer. Patrons of the firm will wish it continued success in its new home.

The Electric Appliance company, Chicago, is selling agent for the "O. K." wire, manufactured by the Phillips Insulated Wire company, New York. The Appliance company has lately received a number of fine reels of this brand of wire and intends to make it a special feature among its exhibits at the World's Fair. The factory of the Phillips Insulated Wire company is situated at Pawtucket, R. I.

Clark & Marshall, dealers in electrical specialties, may now be found in their new quarters, room 413 Rookery, Chicago, where they will show their new specialties in the line of fan motors for direct and battery circuits, storage batteries, consolidated knife switches, flexible brackets, etc. The firm opens this office for the convenience of its friends and patrons in the city during the World's Fair.

The J. T. Case Engine company of New Britain, Conn., manufacturer of the well known and improved Case automatic high speed engine, has recently issued an illustrated catalogue describing its machine, which will be of much interest to the trade. Simplicity and compactness are the points aimed at, and those who have a knowledge of the engine can testify that these merits have been attained. It is of a type of construction permitting of the adoption of the fewest working parts, and these of the lightest weight, resulting in the accomplishment of high speed without injurious vibration.

The Ansonia Electric company, formerly the Electrical Supply company, Chicago, continues to receive orders for its Shield brand moisture proof line wire. It reports the sales of last week to have been among the largest since it has handled the wire. This company will soon be in better condition than ever to supply the Wirt indicators and the standardized fuse links, as all testing, calibrating, etc., is now to be done at the new Wirt laboratory. So satisfactory have been the sales of the Wirt indicator that the Ansonia company intends making a special exhibit of them at the World's Fair. Orders for several 1,800 ampere indicators have been recently received.

Among dry batteries perhaps there is none better or more favorably known than the Ajax. Four years ago this battery was placed on the market and continual improvements have been made upon it until the exclusive agent, the Ansonia Electric company, Chicago, formerly the Electrical Supply company, claims it to be the leading dry battery in the country to-day. It still wears the familiar red jacket with a cut of Ajax defying the lightning. This firm has recently turned out a colossal Ajax battery for exhibition at the World's Fair, which will give a current of six volts and seven amperes. Its dimensions are 30 inches high by 12 inches in diameter and it no doubt will attract considerable attention in the electrical building.

In completeness of detail and compactness of matter, the new illustrated catalogue and price list just issued by the Electric Gas Lighting company, 195 Devonshire street, Boston, Mass., can hardly be excelled. The book is artistic as well as complete and bears the evidence of careful and thorough preparation. This company has achieved an enviable reputation for the excellence of its electrical apparatus, and a short time spent in examining its latest catalogue will give an idea of the variety of its specialties. Full directions are embodied with the cuts and description of instruments for placing them in proper position for use and explaining their care. Batteries and battery supplies, wires, cables, telegraph instruments, motors, electrical tools, push buttons, induction coils, cut outs—all are fully treated and illustrated in a manner that attracts consideration and demands attention. One particular feature of the stock is the electro-medical instrument assortment comprising the Crown Faradic battery, medical induction coils and a number of batteries especially designed for the medical fraternity.

BUSINESS.

The Chicago office of the Phœnix Iron Works company has been moved from 418 Chamber of Commerce to 519 Rookery.

The Ansonia Electric company, formerly the Electrical Supply company, Chicago, has secured the contract for the overhead equipment for 10 miles of road for the Miami Valley electric railway, running from Piqua to Troy, O.

The Commercial Electric company, of Indianapolis through its Chicago office, 455 Rookery building, has just installed a 15 horse power motor in the establishment of the Vienna Bakery company, west side, Chicago. This sale was made in the face of strong competition and it is needless to say, is a good indication of the excellence of the Commercial machine. This company has also just placed a 20 horse power motor in Chicago through the Ansonia Electric company.

H. W. Knight & Son, of Seneca Falls, N. Y., have made pattern letters and figures for thirty years, and their long experience gives them a firm hold on the trade, and enables them to lead in their line. All their letters are cast, and finished by hand. They constantly have on hand 2,000,000 letters and figures in their stock. Of some of the smaller sizes of which there is a large demand, they have 30,000 finished and ready to ship. This enables them to fill all orders the same day received. Some of their hair-line letters are so small that it takes 10,000 to weigh a pound, while others weigh 20 pounds each. They have agencies established all over the United States, also in Europe. Address them for their catalogue, drawer 1256.

Electrical manufacturers will find the exhibit of the Eureka Tempered Copper company of North East, Pa., at the World's Fair especially interesting. This concern has spared no expense to illustrate through its exhibit the great progress it has made in the production of tempered copper. The company's booth is situated in the electricity building, second floor, section U, No. 14. It is a few feet to the left of the southwest entrance. The interior of the booth is fitted up with hardwood cases lined with black velvet, in which are displayed samples of the company's copper. Case "A" will contain samples of the Eureka rolled tempered copper that have been made into motor brushes for all systems; case "B" will contain a representative line of miscellaneous articles and novelties made by the company. In cases "C" and "D" will be found finished commutator segments of pure tempered copper for almost every system; case "E" is filled with a fine lot of ring castings that may be cut into segments for the Brush, Western and Thomson-Houston systems; case "F" contains street railway trolleys for nearly all systems, and also a fine collection of soldering irons and cast bars; case "G" is filled with bare and insulated wires; and case "H" contains commutator heads and bearings of various kinds. There will be, too, an exhibit of castings for surgical instruments, etc., and two long tables filled with commutator heads. At the entrance to the booth are two commutators made for the Westinghouse system that weigh 1,000 pounds each; in fact it is interesting to note in this connection that every current for either light or power purposes furnished under the Westinghouse contract with the exposition comes from commutator segments of Eureka tempered copper. The booth which will contain the elaborate exhibit of the Eureka Tempered Copper company was the first one in the electricity building to be completed. This was due to the energy and zeal of the company, which has done all in its power to make the exhibit one of the handsomest in the building. The company's Chicago office, at 407 Rookery building, is in charge of W. H. Grissom.

ELECTRICAL PATENTS.

Issued April 25, 1893.

495,996. Closed Conduit Electric Railway. William P. Patton, New York, N. Y.

496,019 Electric Soldering. Elihu Thomson, Lynn, Mass.

The invention is designed to overcome the difficulty experienced in soldering long seams, due to the fact that the cooling takes place unequally; and, at the moment the solder sets parts of the seam contract and draw, thus breaking the joint. The pieces to be soldered are clamped together at the seam or joint, and an electric current is then passed through the pieces to be joined, and in sufficient volume to melt the solder or uniting material, after which the current is cut off, but the clamping pressure maintained until the joint cools.

496,020. System of Electric Distribution. Elihu Thomson, Swampscott, Mass.

496,041. Electro-mechanical Block Signaling Apparatus. Murray Corrington, New York, N. Y.

496,069. Electrical Stop Motion for Knitting Machines. George J. Manderfield, Royersford, Pa.

496,067. Electric Alarm for Tanks. Frederic C. Skelton, Montreal, Can.

496,076. Signaling Apparatus. Hermann Wetzer, Pfronten, Germany.

496,081. Insulator. Joseph F. Wright, Colorado Springs, Colo.

496,103. Electric Cigar Lighter. Lawrence T. Smith, Barrington, R. I.

496,104. Lineman's Wire Grip. Claes A. Svensson, Buffalo, N. Y.

496,126. Storage Battery. Frederick A. La Roche, Philadelphia, Pa.

A porous partition is placed between the positive and negative electrodes of the cell and the cell hermetically sealed, the partition permitting the passage of liquid below the surface of the liquid, but having its pores above the surface line filled, or otherwise treated, so that the evolved gases may not pass through the partition. Thus, in charging the battery, the gas evolved from the positive pole will be confined in the chamber between the surface of the liquid and the top of the cell, while the gas evolved from the negative pole will be likewise confined in a chamber, the chambers being distinct and non-communicating. By thus collecting the gases which are evolved at the poles and keeping them in electrical connection with the poles at which they are evolved, the work done in evolving them, it is found, can be largely returned in the discharge of the battery. It has been found that each cell has thus a greater electromotive force and a greater capacity when charged.

496,134. Electric Synchronizer for Clocks. Henry S. Prentiss, Elizabeth, N. J.

496,135. Electric Synchronizer for Clocks. Henry S. Prentiss, Elizabeth, N. J.

496,137. Mechanical Telephone. George H. E. Ricke, Cincinnati, O.

496,191. Phonograph. Thomas A. Edison, Llewellyn Park, N. J.

496,192. Annunciator. John H. Elfering, Milford, Conn.

496,207. Electric Reporter. Major D. Porter, Brooklyn, N. Y.

496,208. Process of and Apparatus for Tempering or Hardening Steel Wire. Henry E. Procunier, Oak Park, Ill.

496 212. Electric Converter. William Stanley, jr., Great Barrington, Mass.

496,224. Diaphragm Holder for Telephones. Silas W. Holman, Boston, Mass.

The diaphragm, instead of being rigidly secured or clamped at some or all points around its periphery, is supported between two rings of different diameters, the action of the two rings serving to deflect the center of the diaphram in one direction. The electro-magnet is so mounted that in acting upon the diaphragm it opposes this tendency of deflection, caused by the rings of different diameter.

496,258. Electric Programme Clock. Henry C. Hain, Booneville, Mo.

496,307. Combined Dynamo-electric Machine and Water Motor. John O. Heinze, jr., Lynn, Mass.

496,308. Cut-out and Circuit Protector. John O. Heinze, jr., Lynn, Mass.

496,309. Volt and Ampere Meter. John O. Heinze, jr., Lynn, Mass.

496,312. Electric Measuring Instrument. Rudolph M. Hunter, Philadelphia, Pa.

The measuring instrument is of the type in which the movement of the index is effected by the expansion of a wire included in circuit with the current to be measured. Besides the expansible wire a compensating wire is provided which is not included in the electric circuit, but which is so connected with the expansible wire that any change of temperature due to external influences, as the weather, will be compensated for.

496,324. Coin Controlled Automaton. Harry D. Pursell and Edwin F. Price, Washington Court House, O.

496,329. Telpher System. Charles J. Van Depoele, Lynn, Mass.

The track comprises four rails running parallel and placed one upon each of the four sides of the car, which is provided with wheels adapted to engage with the various rails. The lower rail serves to support the greater part of the weight of the car, the rail above and those at the sides serving to maintain the car in a vertical position. The rails are joined together by strong metallic yokes or frames which are mounted upon supports.

496,330. Electric Locomotive. Charles J. Van Depoele, Lynn, Mass.

496,331. Electro-magnetic Reciprocating Pump. Charles J. Van Depoele, Lynn, Mass.

The pump comprises a solenoid provided with a core adapted to be moved vertically by changing the polarity of the solenoid. To the lower end of the core is attached the piston of the pump, which, during the upward stroke of the core, raises the water from the reservoir by suction; and which, during the descent of the core, forces the water upward. The core possesses considerable weight, so that advantage may be taken of the work yielded by its descent, the greatest amount of energy being desirable at this time, as the forcing action of the pump is then taking place.

496,366. Electric Light Display System. Daniel McF. Moore and Charles M. Jacobs, New York, N. Y.

496,371. Electric Meter. Francis Teague, London, Eng., assignor.

496,373. Matrix Making Machine. Charles L. Travis, Minneapolis, Minn.

496,381. Cable Rack. Albert C. Gray, Pittsburg, Pa.

Vertical rods or tubes are supported between transverse beams at the top and bottom of a multiple switch-board for telephone exchanges. To the vertical rods are journaled brackets, which are provided with axial openings through which set-screws pass, by means of which the brackets may be clamped to the vertical rods at any height. By means of the axial set-screws the position of the bracket may be altered without removing the cables carried on it.

496,382. Controlling Device for Electric Elevators. Charles E. Moore, Boston, Mass.

496,386. Electric Arc Lamp. William H. Akester, London, Eng.

496,387. Electric Arc Lamp. William H. Akester, London, Eng.

The lower carbon is supported upon a vertical movable frame and a cord passes from this frame upward and over a pulley, and down again to the upper carbon, which is suspended from this downwardly extending portion. The upper carbon is somewhat heavier than the lower carbon, so that when the upper carbon is unclamped by the feeding mechanism, feeding takes place.

THE "CLARK" WIRE.

TRADE MARK.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect"

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

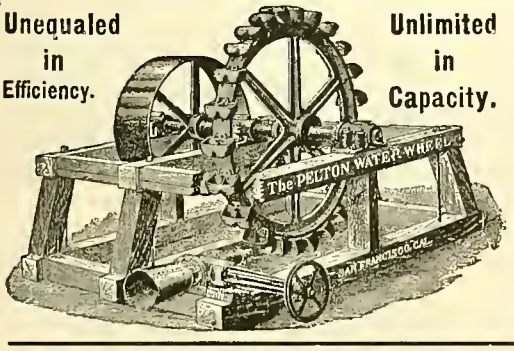
The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

THE PELTON WATER WHEEL.

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.,

121-123 Main St., San Francisco, Cal., U. S. A.

143 LIBERTY STREET, - - NEW YORK.

☞ It having come to our notice that our patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted.

PELTON WATER MOTORS. Varying from the fraction of 1 to 15 and 20 horse power, unequaled for all light running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ Send for Motor Circular. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A.M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 Inches. Price, postage Prepaid, to any part of the world. $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS**, to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

WESTERN ELECTRIC COMPANY,

CHICAGO and NEW YORK.

THE ONLY OBJECTION

To the alternating system, which was that power could not be supplied by it as by the straight current system, is at last

SWEPT AWAY BY OUR TWO PHASE MOTOR.

WE NOW OFFER

A COMPLETE ALTERNATING SYSTEM

For supplying both light and power from the same dynamo and circuit.

SELF-STARTING EFFICIENT MOTORS

In various sizes for Two Phase circuits.

GENERATORS, TRANSFORMERS, ETC.

All parties about to purchase new generators, or contemplating transmission of power for any purpose, are invited to correspond with us, and cordially invited to see our system in practical operation in Pittsfield.

CAUTION.

Don't buy Single Phase machines, when by buying Two Phase, you can run your lights equally well and also run motors from the same circuit.

STANLEY ELECTRIC MFG. CO.,

MAY 1, 1893. **Pittsfield, Mass.**

Fort Wayne Electric Company,

FORT WAYNE, IND.

CALLS ATTENTION TO ITS NEW

"Wood" Iron-Clad Slow Speed Alternator.

This Alternator contains the following features of merit: It has the highest electrical efficiency; the best mechanical construction; the most artistic design, and the best ventilated armature ever constructed. The armature is in fact indestructible. These dynamos are being manufactured in the following sizes: 750 light, 1,500 light, 3,000 light and 6,000 light capacity. This Iron-Clad Alternator can be seen in operation at our exhibit at the World's Fair.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is re-written and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

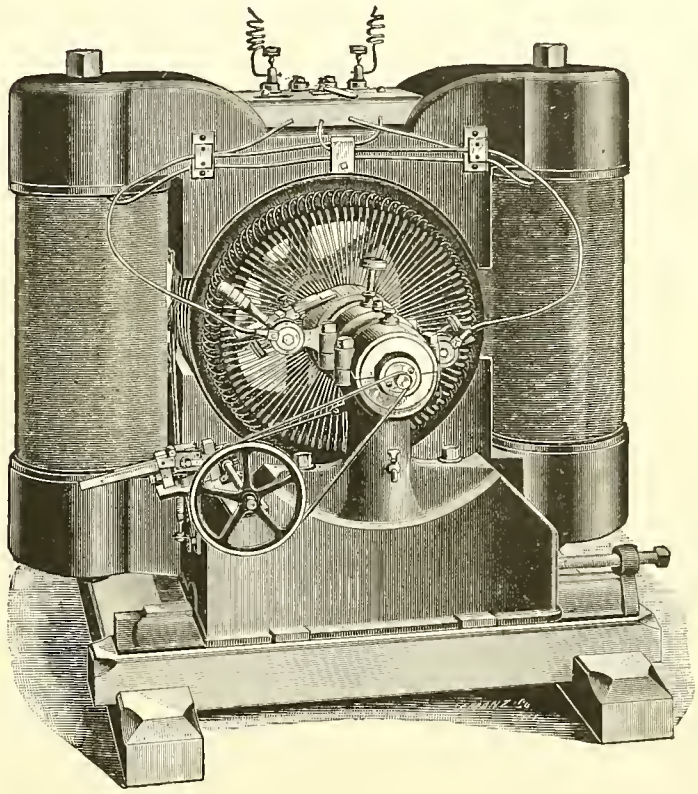
BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



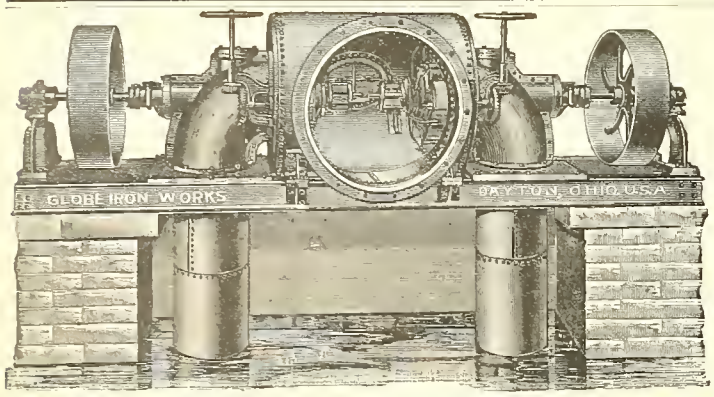
ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.



THE NEW AMERICAN
TURBINE WATER WHEEL.

PARTICULARLY ADAPTED TO DRIVING

Electric Light and Power Stations

On account of its high efficiency at all etagee of gate, steadiness of motion and easy working gate, the construction of which makes it the most sensitive to the action of a governor of any wheel on the market.

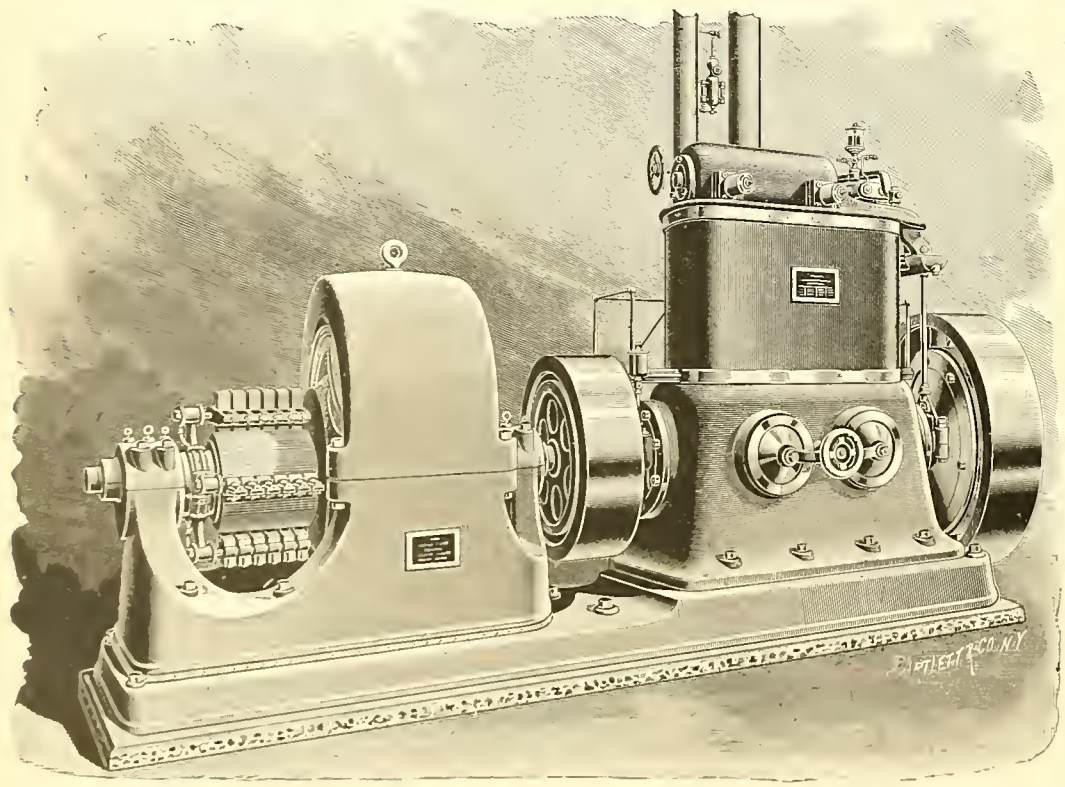
DIRECT COUPLED, SLOW SPEED,
MULTIPOLAR RAILWAY GENERATOR.



PRESENT SIZES: 100, 150, 250, 500 H. P.

Before you build or enlarge your Power Station, you will do well to consider the fact that under our construction

You will Reduce your Total Floor Space, including Boilers, (with reserve) Fire Room, Economizer, Stack, Pump Room, etc., TO 5 SQ. FT. PER ELECTRICAL HORSE POWER in plants of 1,000 H. P., and to 2.25 SQ. FT. in plants of 6,000 H. P. upward.

You will enormously reduce Cost of Real Estate and Buildings.

You will operate at a Lower Cost per Car Mile, both of Fuel also; and of total Power Account, than with any known form of Plant, because you will for the first time realize almost Uniform Steam Economy of the highest order over the whole fluctuation of your load, and that whether condensing or non-condensing.

You will enjoy the Insurance Against Accident, which can only be had with Independent Units.

You will secure absolute Noiselessness.

You will get perfect Regulation by an Inertia Governor.

You will never know a hot bearing or a broken belt.

We have now ready the Second Edition of "NOTES ON POWER PLANTS."

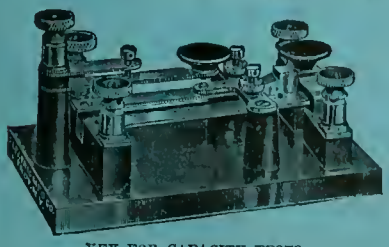
Manson Protecting Tape.
Okonite Waterproof Tape.

BRANCHES: Chicago, Boston, Philadelphia, Minneapolis, Cincinnati, Kansas City, Omaha, Louisville, St. Louis, San Francisco, London and So. America.

THE E. S. GREELEY & CO.,
5 and 7 DEY STREET, NEW YORK,
MANUFACTURERS, IMPORTERS AND DEALERS IN



Electrical Supplies
OF ALL DESCRIPTIONS.

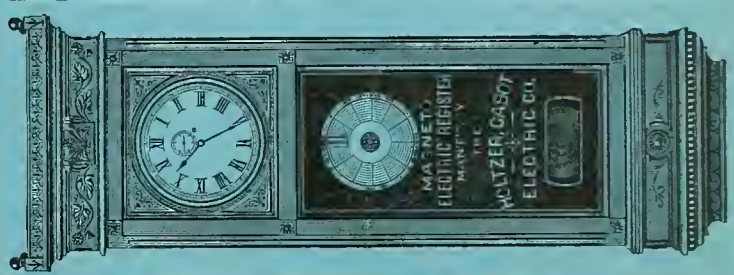
Telegraph, Telephone, Electric Light and Power Appliances. Construction Tools and Line Material.

KEY FOR CAPACITY TESTS.

WE OWN AND OPERATE THE
Greeley Electrical Laboratory,
WHERE WE MANUFACTURE A FULL LINE OF
Test Instruments and all Scientific Measurement Apparatus.

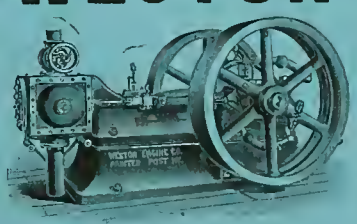
PACKARD HIGH GRADE INCANDESCENT LAMPS
Manufactured by the
NEW YORK & OHIO COMPANY, Warren, Ohio.
AGENTS:
New York City, Chas. E. Chapin, 136 Liberty St.
Chicago, Ill., Elec Appliance Co., 242 Madison St.
St. Paul, Minn., The Elec. Engineering & Supply Co.
St. Louis, Mo., St. Louis Electrical Supply Co.
San Francisco, Cal., A. C. Brainard & Son, No. 109 California St.
Cincinnati, O., Post-Glover Elec. Co., 215 W. 4th St.
Pittsburgh, Pa., Duquesne Electric Supply & Construction Co.
Montreal, Can., Packard Lamp Co., 96-100 King St.
Washington, Northwest Fixture & Elec. Co., Seattle.

ALFRED F. MOORE,
MANUFACTURER OF
INSULATED ELECTRIC WIRE,
FLEXIBLE CORDS and CABLES.
200 and 202 North Third Street, - - PHILADELPHIA, PA.



MAGNETO WATCHMEN'S CLOCKS.
PRICES REDUCED.
HOLTZER-CABOT ELECTRIC CO., 92 Franklin St., Boston, Mass.

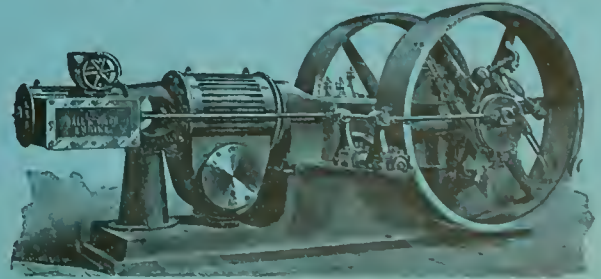
WESTON ENGINES.



HIGH PRESSURE BOILERS.
COMPLETE POWER PLANTS.
ESTIMATES AND DRAWINGS SUBMITTED.
WESTON ENGINE CO.,
Painted Post, N. Y.
REPRESENTATIVES:
Julian Scholl & Co., 126 Liberty St., New York.
Geo. D. Hoffman, 82 Lake St., Chicago, Ill.
H. M. Scipie & Co., 3d & Arch Sts., Philadelphia.

Jewell Belting Co., Hartford, Conn.

THE BALL & WOOD COMPANY,
Builders of Improved Automatic Cut-off Engines.



AGENTS:
W. B. Pearson & Co., Home Ins. Bldg., Chicago, Ill.
W. A. Day, 128 Oliver St., Boston, Mass.
F. H. Whiting, Jacobson Block, Denver, Colo.
James & Co., Chattanooga, Tenn.
William M. Porter, Detroit, Mich.
T. W. Anderson, Houston, Tex.

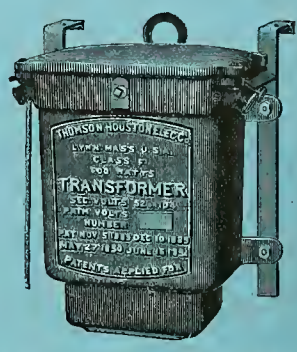
TRANSFORMERS

PERFECT SAFETY.

HIGHEST EFFICIENCY.

GOOD REGULATION.

30,000 WATT TRANSFORMER.



SMALL CORE LOSS.

CONVENIENCE IN INSTALLATION.

OIL INSULATION.

Best Possible Mechanical Insulation, with Additional Insulation of Oil. Core Ground Wire. Primary and Secondary Coils are Fully Subdivided. No Fuses in the Transformer Case.

TRANSMISSION OF POWER BY ELECTRICITY OVER LONG DISTANCES

Is rendered practicable by means of our "Step Up" and "Step Down" Transformers, the Insulation in which is Tested to Withstand a Pressure of 10,000 Volts Alternating.

CARPENTER ENAMEL RHEOSTATS.

TWO-PHASE GENERATORS

Of our Standard Alternating Current Sizes, for use with

Stanley-Kelly Two Phase Motors.

For Prices and Information Address nearest District Office.

GENERAL ELECTRIC COMPANY,

"STANDARD"

Single Push Button Flush

SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push buttoo Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this switch single pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

ON EXHIBITION AT WORLD'S FAIR.

Central Station and Isolated Plant Astatic Ammeter (One-half Size.)

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*.

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch-board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

Vol. XII. CHICAGO, MAY 13, 1893. No. 19

How President Cleveland Opened the World's Fair by Electricity.

By Locke Etheridge.

Many ingenious theories have been brought forward to explain how President Cleveland actually set in motion the wheels of the Columbian Exposition on May 1st. Of course it was evident to the thousands present at the time that all he himself actually did was simply to press lightly on a highly ornamented telegraph key, but the mechanism by which the simple pressure of his finger set in motion many ponderous machines has never, as far as I am aware, been fully and truthfully explained.

In the first place, the whole system was an electrical one. From the president's key two wires led under the stand, back into the administration building, thence by underground duct to the great electric subway. The lines followed the subway into machinery hall and then split, one side running to the large 15,000,000 gallon Worthington pump in the pump-house, and the other running to the E. P. Allis & Co.'s engine block in machinery hall. A wire also connected the Worthington pump with the Allis engine, completing the circuit.

At the Allis engine was placed the engine starter made by the Electro Automatic Appliance company of Hartford, Conn. It consisted of a silver trimmed, polished oak case about 12 or 15 inches square, surmounted by a ten-inch, silver plated gong. Running through the case was a light shaft carrying a powerful spiral spring and a heavy hough small balance wheel. On the end of the shaft, outside the case, was a small sprocket wheel and chain, connected to another sprocket wheel secured on the stem of the throttle valve. The act of closing the engine valve wound up the spring, and it was secured in its state of tension by a small trigger. This trigger was controlled by the armature of a powerful electro-magnet, so that when the circuit was closed, with a magnet and a battery in circuit, the armature was attracted, the trigger released the balance wheel, and the stored energy of the coiled spring caused the shaft to revolve in the opposite direction to which it did when the throttle was closed. Thus, by the medium of the two sprocket wheels and the chain, the steam valve to the engine was opened. Connected in multiple with the electro magnets that controlled the trigger was another pair of coils, with a vibrating armature, to ring the gong on the outside of the case. An illustration of this device is presented in Fig. 3.

At the pump-house another system was in use. It was an electrically controlled valve, handsomely silver-plated, supported on a polished oak table, and furnished by the National Electric Valve company. In this case the armature of a powerful electro-magnet controlled the valve stem of a miniature steam chest, the movement of which allowed steam to enter on one side of a small piston and rod contained in a cylinder, the movement of the piston throwing the throttle of the pumps wide open.

The controling magnets of these two automatic engine starters, one in the pump-house and the other in machinery hall, were connected in series with six "Ajax" cells and twelve cells of "Perfected" dry battery, and were connected with a No. 14 B. & S. double and twisted insulated wire furnished by the Safety Insulated Wire company of New York. The metallic circuit led to the stand, where stood the golden Victor key, Fig. 2, on its standard of yellow and blue plush, ready for the touch of the presidential finger, as shown in Fig. 1.

The key itself is a very handsome piece of workmanship. It is of solid gold, with an ivory finger rest, and on the sides of the handsome plush standard were the dates 1492–1893. The key and standard were furnished by the E. S. Greeley & Co. of New York, through the World's Fair representative of the company, Mr. Auerbacher. The key on its pedestal will be on exhibition in the company's exhibit in the electricity building.

FIG. 1. HOW PRESIDENT CLEVELAND OPENED THE WORLD'S FAIR BY ELECTRICITY.—THE KEY AND STANDARD IN POSITION.

In starting the fountains it was found necessary that the pressure of water in the mains should be up to full pressure just as the key was touched, and as it was not practicable for this pressure to be kept up for any great length of time some warning signals were necessary to accomplish this result. W. F. Lewis of the General Electric company stationed himself directly behind the president's chair with a push-button which operated a bell in the northeast tower of machinery hall. In the tower was the stand of F. H. Dorr, who controled the various

water effects of the fountains. He was in communication with both fountains and with the pump house by electric bells. Three minutes before the president touched the key Mr. Lewis signaled to Mr. Dorr. The latter transmitted the signal to the pump-house and to both fountains. In the pump-house the pressure was gradually raised to full load, and in the fountains men stood with their hands on the valves which controlled the

FIG. 2. HOW PRESIDENT CLEVELAND OPENED THE WORLD'S FAIR BY ELECTRICITY.—THE KEY EMPLOYED.

jets. At the same instant that the president's key was pressed Mr. Lewis again signaled to Mr. Dorr, who then signaled to the fountains for the men to open the valves wide, and as the pumps were started at the same instant by the president the fountains burst forth in one grand pyramid of water.

All these lines were tested carefully several times to prevent any accident that might at the last moment disarrange the final results.

The various actors who were "behind the scenes" met in the electricity building on the morning of May 1st, at six oclock, and, over an early "bite," went over the plans again and again, so as to be "letter perfect" in every detail, and then hurried away, each to practice his portion, to be sure that nothing had occured to spoil the looked-for result.

Much credit is due to Dr. J. Allan Hornsby, assistant chief of the department of electricity, and to Lieut. Spencer of the General Electric company for their earnest efforts for the success of the affair. And it was a success, as history will bear witness, for it can truthfully be said that "Cleveland touched the button and electricity did the rest."

American Institute of Electrical Engineers.

The annual meeting of the American Institute of Electrical Engineers for the reception of the yearly reports, the election of officers and the transaction of other business will be held at the headquarters of the institute, 12 West Thirty-first street, New York, at 4 P. M., Tuesday, May 16th. It is expected that this session will occupy about two and one-half hours. After adjournment, those who so desire will assemble at "The Arena," 41 West Thirty-first street, where dinner will be served. This will be a purely social gathering, to which friends may be invited.

The general meeting of the institute will be held on

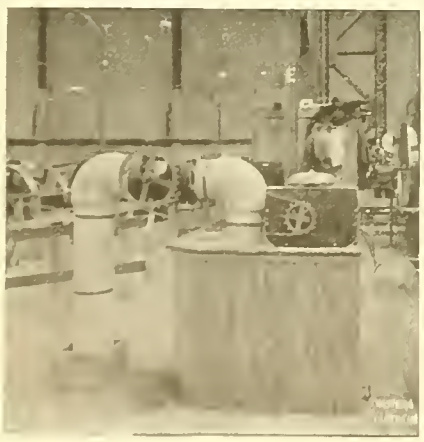

FIG. 3. HOW PRESIDENT CLEVELAND OPENED THE WORLD'S FAIR BY ELECTRICITY.—STARTING DEVICE ON THE ALLIS ENGINE.

Wednesday, May 17th. Two sessions will be held at which the following list of papers will be presented for discussion:

"On the Behavior of Fuse Metals in Direct and Alternate Current Circuits," by Charles P. Matthews of Cornell University, Ithaca, N. Y.

"A Modified Deprez D'Arsonval Galvanometer," by Lieut. Charles D. Parkhurst of Watervliet Arsenal, West Troy, N. Y.

"The Variation in Economy of the Steam Engine Due to Variation in Load," by Prof. R. C. Carpenter of Cornell University, Ithaca, N. Y.

"An Automatic Printing Speed Counter for Dynamo Shafting," by Prof. George S. Moler of Cornell University, Ithaca, N. Y.

"Practical Aspects of Electrical Resonance," by Dr. M. I. Pupin of Columbian College, New York city.

"The World's Electrical Congress of 1893," discussion of the provisional programme prepared by the Institute committee. This report with its appendices has been printed, and absent members are earnestly invited to contribute in writing any comments they desire to make.

"High Tension Generators for Direct Current Transmission," by Prof. Francis B. Crocker of Columbia College, New York city.

"The Heating of Armatures," by A. H. and C. E. Timmerman of Cornell University, Ithaca, N. Y.

Electricity at the World's Fair.

Aside from the electrical effects in the opening exercises, which are described by Mr. Etheridge in an article on another page, the first week of the World's Fair was not especially noteworthy from an electrical point of view. The electricity building was not open to visitors during the week, owing to delay in installing exhibits, largely caused by trouble in getting cars after delivery at the grounds by the railroad companies. The electric launches made regular trips and received considerable patronage. On the intramural line a train was running, but at infrequent intervals and carrying few passengers. Undoubtedly the number of persons carried on this road would have been much larger but for the chilly weather, which not only reduced the number of visitors but induced people to seek better protection from the penetrating wind from the lake than that afforded by the open cars on the elevated structure. The electric fountains were not electrically tested owing to the non-arrival of cable from Schenectady.

On the opening day one of the most picturesque features was the assemblage of electric launches and Venetian gondolas in the basin in front of the administration building. The boats made a very pretty appearance gliding about without noise or steam, and were the subject of many admiring comments. A view showing a portion of the water scene is presented in Fig. 1. After the president had formally opened the fair and had paid a visit to the great manufactures building, he was taken for a ride on one of the electric boats, the start being made at the landing at the northwest corner of the manufactures building. The throng was so great that the president was in imminent danger of being crowded off the landing before he could step into the boat. The little craft went down perceptibly when the weight of the nation's executive was placed upon it. The boat was No. 11 of the lagoon fleet, and was piloted by R. T. Garrabrant. It carried no awnings. Capt. Simonds received the voyagers and helped them into the five launches. No. 11 was first away and led the little fleet northward between the shores, which resounded with thousands of voices. The president sat in the stern with Director general Davis at his left and President Palmer at his right. After traversing the lagoon in a course closely skirting the shore, the voyage was completed at the steps leading up to the agriculture building, where the party took carriages again. The photograph reproduced in Fig. 2 shows the presidential party in electric launches near the point of debarkation. President Cleveland is shown in the leading boat, and, as he is standing up in the stern, his figure can be readily distinguished.

One of the General Electric company's exhibits is a Lake Erie upright engine of the marine type directly coupled to a 75 kilowatt multipolar dynamo. An annoying accident occurred as this engine was being taken from the car on which it came. Through the carelessness of some workmen the heavy engine was allowed to drop to the ground, wrenching off the governor and otherwise badly damaging it. The exposition staff of the General Electric company is indignant at the carelessness displayed, for which, it is asserted, there was no excuse.

Prof. Elihu Thomson's apparatus for producing high potential discharges has arrived in the electricity building, and already attracts much attention. Sparks three or four feet long will be produced at an estimated difference of potential between the terminals of one million volts. Oil insulation is used according to the method described by Prof. Thomson in his recent article on the subject published in the WESTERN ELECTRICIAN. The phenomenon will form one of the most attractive features in the building and will be sure to draw a wondering throng. The apparatus is in charge of A. Howland, who superintended the shipment of all the World's Fair material from the Thomson Houston factory at Lynn.

It is an interesting fact that, although nearly all the exhibits in electricity building are now well along toward completion, but four were completely ready on the opening day. The exhibitors who comprise this roll of honor are Queen & Co., the Thomson Electric Welding company, Day's Kerite and H. T. Paiste & Co.

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC LAUNCHES IN THE GRAND BASIN.

Much energy is displayed in the work of completing the electrical construction work at the World's Fair. About the great central court the incandescent wiring for the administration building, music hall and peristyle is entirely finished, and all the lamps are in position. The exterior incandescent lighting of the administration building has been completed, and the long rows of lamps about the cornices, on the ribs of the dome and around the lofty corona give a beautiful effect at night, outlining the beautiful building in lines of light. The eight fifty-light standards, illustrated in the WESTERN ELECTRICIAN a few months ago, which are the most elaborate incandescent lighting fixtures at the park, are also in place in this building, which is now brilliant with 4,950 incandescent lamps. The electrical fountains have successfully withstood the hydraulic test, and the lamps will soon be in position. The temporary pole line, which has proved so useful in the construction operations on the grounds, although contributing in no way to the beauty of the park, has all been taken down, and of course all work now undertaken is of a permanent character. The demand for light, both arc and incandescent, is still great, however. Although much work is being accomplished, the lights would be put in with still greater rapidity if more wiremen could be obtained. About 500 men are now at work on electrical construction at the grounds, but four times that number would be employed if they could be secured.

About six new arc circuits of 50 lights each are being put in every day. The agriculture, manufactures, transportation, horticulture, fisheries and Illinois state buildings are now completely wired, with lamps, and the leather and forestry buildings are also wired, but are not connected with the circuits. Lights are also burning in some of the

other buildings. All the patrol lights are burning except those in the Midway Plaisance and the extreme southern portion of the grounds, about 500 in all. It is expected that all the arc lamps in the park, except those used for lighting the stock exhibit, will be in operation in two weeks. The lamps now in use for patrol lighting are principally Brush and Standard.

O. S. Platt of Bridgeport, Conn., manufacturer of switches, will make an exhibit in electricity building in connection with the Electric Appliance company.

The British government has been invited by the American minister to nominate five official delegates to the World's Electrical Congress at Chicago on August 21st and the following days. The royal commisson for the World's Fair has requested the foreign office to nominate the following named gentlemen: W. H. Preece, F.R.S. (president Institute of Electrical Engineers); Prof. W. E. Ayrton, F.R.S.; Major Cardew, R.E.; Alexander Siemens and Prof. S. P. Thompson, F.R.S.

Marquis de la Touanne, an engineer attaché to the ministry of posts and telegraphs of Paris, France, is the official delegate of the French government for the department of electricity at the World's Fair. He says that France is making an exhibit which is largely historical.

Lieut. E. J. Spencer, who is in charge of the General Electric company's interests at the World's Fair, has removed his office from the room temporarily occupied by him at the southern end of electricity building in the gallery to the structure erected for the offices of the company on the ground floor of the big building, near the "tower of light." The room thus vacated is next to Prof. Barrett's quarters and will be fitted as a private office for the chief of the department.

In the northeastern corner of electricity building, on the ground floor, the E. S. Greeley & Co. of New York is arranging an extensive and attractive display. The exhibit is shown in show-cases, which contain finely finished instruments, laboratory appliances, annunciators, batteries, telegraphic apparatus, electric bells, switches and specialties of all sorts. Everything is plainly labeled in large letters—a plan that may be commended to other exhibitors. A number of electric bells are arranged in an achromatic scale, and wired in series with a key-board, so that airs may be played. This company manufactured the golden Victor telegraph key used by the president in setting the Allis engine in motion, and this dainty bit of apparatus, together with the original battery cells and wires will be on exhibition. A pyramid showing 109 styles of primary batteries will also be a feature. Telegraphers will be given an opportunity to test the Victor key in connection with Morse, European and "tell-tale" registers.

James Dredge, one of the British royal commissioners to the World's Fair and the well known editor of London *Engineering*, was entertained at dinner on the evening of May 3d by the Western Society of Engineers. Mr. Dredge has been one of the staunchest upholders of the exposition in England, and the value of his services, extended personally and through the columns of his admirable journal, has been gratefully recognized by the friends of the fair.

Queen & Co. of Philadelphia are making a fine display of electrical instruments in their space on the ground floor of electricity building, near the northern entrance. The company also has four exhibits of scientific appliances in manufactures building. The features of the total exhibit are described in a pamphlet entitled "Some Features of the World's Columbian Exposition."

Prof. Elisha Gray, chairman of the World's Electrical Congress, received the following cablegram from W. H. Preece of London, England, on Monday:

The electrical engineers of England, dining together at their club to-night, desire to convey to their professional brethren in Chicago sincere congratulations upon the opening of their grand exhibition. We hope to appear in person in August next to support the success of your magnificent undertaking.

To the list of engines in the electrical service plant in machinery hall, published last week on page 246, one New York Safety 150 horse power engine should have been added.

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.—PRESIDENT CLEVELAND IN AN ELECTRIC LAUNCH.

Electric Stations as Insurance Risks.

The fire hazard of electric lighting, though a well-worn subject, succeeds in cropping up from time to time, and is the theme of many a paper, and the fruit of many a discussion. In this country, however, says the London *Electrical Review*, matters have so far settled down that we now rarely hear of those mishaps formerly attending electric lighting, and the fire offices have little to complain of in the way of so-called electrical fires. In America, however, the case is somewhat different. Complaints still reach us of the unsatisfactory—not to say slipshod—manner in which many of the installations are carried out, and we believe the fire offices have good cause to regard the "light of the future" as anything but an unmixed boon in that country. It would appear, also, that the same experience applies to the generating stations, which have proved during the past few years to be very unremunerative risks; so much so, indeed, that some insurance companies decline to entertain them on any terms, while others charge practically prohibitive rates, or impose conditions unacceptable to the lighting interests. Why the grinding out of electricity should be so hazardous an operation in the states is more or less a mystery, and we have for a long time looked in vain for some statistics dealing with the question.

George P. Low of San Francisco has endeavored to supply the want by a paper read before the Fire Underwriters' Association of the Pacific, as published in the WESTERN ELECTRICIAN of March 18th last. It is true the results of a canvass by circular of the 180 stations within the jurisdiction of the association are somewhat disappointing, only 87 having responded, and the greater part of these returned figures only for the year 1892. Still they are interesting, and, in a measure, reassuring.

It is now pretty evident that the high loss ratios are due not to this or that particular system of distribution, nor to any particular device or apparatus employed—in fact, to nothing that may be said to be specially inherent in electricity itself—but to causes appertaining to any factory or works where power is employed, and where the arrangements for such are faulty. During the rush in the early days of electric lighting any shanty was considered good enough for a generating station, the main thing being to get the current along and the money coming in. Hence it is not surprising to find that of the 87 stations referred to, nearly 50 per cent. are timber buildings, and several are joint occupancies with other risks, such as planing mills, saw mills and flour mills.

The estimated value of buildings and plant of the 87 stations referred to amounted to about £832,857, upon which insurances were effected to the extent of £175 494, at an average rate of nearly 2 per cent., and it is satisfactory to know that during last year these particular stations suffered damage by fire to the extent only of £690. The causes are attributed to hot bearings, defective fire-box, and "general fires," by which we presume is meant neighboring fires. Unfortunately no information is forthcoming of the experiences of the remaining 93 stations.

Turning to home, the contrast is striking. Our public supply companies find it to their advantage to erect most substantial structures for their generating stations, built to stand for all time, and in which they provide against fire by the simple expedient of excluding from their boiler houses and engine rooms anything of a combustible nature. Hence there is no difficulty in effecting insurance to any extent required, and at very moderate rates.

In the states improvements are being effected in this respect. Stations are now being erected that, from the fire point of view, leave little to be desired, and the day, let us hope, is not far off when the wooden shanty with its greasy floor will have become a thing of the past.

Electric Light Station in the Champs Elysees Sector, Paris.

The first station for the distribution of electricity in Paris was a modest venture, and, comparatively speaking, the city was backward in the introduction of the new illuminant. On June 20, 1887, the Dronot station was officially opened by Charles Mildé, president of the administrative council of la Compagnie Francaise d'Eclairage Electrique. The station was able to supply only 1,500 lamps at the maximum. Five years before the date mentioned the Pearl street station of the Edison company in New York was in operation. Since that time progress in electric lighting has been rapid, the development dating especially from 1888, when five companies received concessions for lighting five sectors of the city on the right bank of the Seine.

On the first day of March last there were still two sectors unprovided with electric light. These were the Champs Elysees on the right bank and that of the left bank of the Seine. It is likely that it will be some little time before the latter district is electrically lighted, but on March 7th the new plant of la Compagnie Parisienne d'Eclairage Electrique du Secteur des Champ Elysees commenced to supply current in the territory in which it is located.

The Champs Elysees sector covers an area of about 4¼ square miles, and is for the most part a residence district. There are few business blocks, and the consumption by subscribers will be generally small. Statistics gathered in similar districts in other large European cities prove that localities of this description are the least profitable to the electric light company. The concessions for electric lighting, granted by the city of Paris cover a period of only eighteen years, at the expiration of which time the conduits become the property of the municipality. The companies naturally are inclined, therefore, to reduce the investment in the distributing system as much as possible.

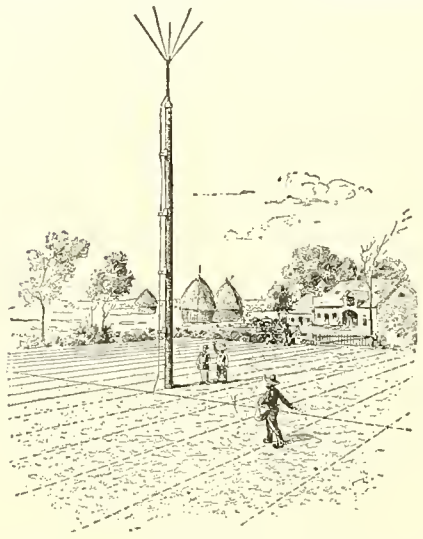
The company decided to install an alternating current system with a potential of 3,000 volts in the primaries. It was also determined to adopt machines of low frequency, not over 40 periods per second, to facilitate coupling dynamos in parallel and to prepare the way for the employment of alternating current motors.

The station is located at Levallois-Perret on the bank of the Seine at a point convenient for receiving coal and obtaining water for the boilers and for condensing purposes. The structure was built of iron and brick and rests on a foundation constructed on piles.

The boilers, which are five in number and of the Galloway type, were built by Renaux Fils et Bonpain, of Rouen. Their capacity is 6,500 pounds of steam per hour. Water is pumped from the Seine, passing first through a Gaillet filter and thence to a Green fuel economizer in which the temperature of the feed water is raised to 100 degrees C.

The engines are in three groups, Fig. 1. The first consists of a pair of Corliss engines, driving a 400 kilowatt alternator and a 25 kilowatt exciter. The second and third are Corliss engines driving 400 kilowatt alternators and 25 kilowatt exciters. The engines, which are condensing, were constructed by the Tarcot company. The three alternators now installed were built by Hillairet & Huguet of Paris. They have fixed armatures with rotating fields, which are mounted on extensions of the engine shafts. The fields are 22 feet 10 inches in diameter and have 80 poles. The number of armature coils is the same. The output of the machines is 133 amperes at 3,000 volts, while the normal capacity of the machines is 400 kilowatts; they can be worked up to 455 kilowatts if necessary. Their commercial efficiency guaranteed by the builders is 85 per cent.

The switchboard shown in Fig. 2, E. Hospitalier says in a recent article, is one of the most complete to be seen. All the circuits and the connections are in plain sight and all wires traversed by alternating currents are painted a bright red to attract the attention of the operator who is never allowed to touch any apparatus until he has drawn on a pair of rubber gloves. Opening or closing the high tension circuits is effected by stationary connections which are brought into circuit by means of mercury contained in ebonite vessels. This operation is effected by means of levers arranged in a line across the board. The switchboard is 13 feet in height and 65 feet 6 inches in length.



THE GEOMAGNETIFERE.

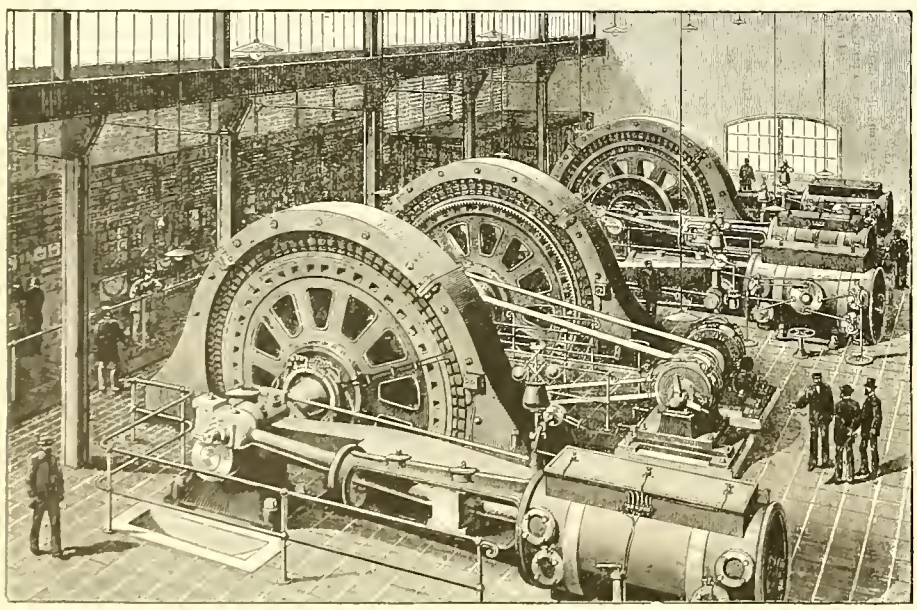


FIG. 1. ELECTRIC LIGHT STATION IN THE CHAMPS ELYSEES SECTOR, PARIS.

The current is distributed by Berthaud-Borel concentric cables made by the Cail company. The resistance per kilometer between the two conductors ranges between 4,000 and 5 000 megohms. The following table of megohms per kilometer was obtained by tests of the cables now laid, with lines to houses connected up:

	Maximum.	Minimum.	Average.
Resistance between central conductor and the earth.....	9,185	4,843	7,083
Resistance between annular conductor and the earth....	3 091	1,930	2,226
Resistance between the two conductors.....	6,030	2,900	4,847

When the cables are placed under the sidewalks they are merely laid in a trench on a layer of sand, which facilitates the drainage. Above them is placed a thin tile and nearer to the surface a wire screen to protect them from the tools of workmen. In the streets the cables are laid in cast iron pipes.

The transformers in use are the new Zipernowski type shown in Fig. 3. The sizes employed are 1, 2, 5, 10 and 25 kilowatts capacity. The Thomson meter is employed for measuring current. The prices charged for current vary in accordance with the amount of consumption. In private hotels and residences where the requirement is small the charge is about a cent per lamp-hour for a 10 candle power lamp. The largest consumers are charged about 20 per cent. less. The cuts are reproduced from *La Nature*.

The Geomagnetifere.[1]

By C. Crepeaux.

Does electricity, that has transformed almost all our modern industries, exert a favorable influence on vegetable growth? Can it be applied by the agriculturist to increase germination, to secure a more perfect development of a plant, and, as a consequence, to produce a greater crop? These questions have been much discussed lately, and different opinions have been expressed. There has been no lack of experimenters in this field, for since the time of Abbe Nollet, von Maimbray, Menon and Bose, who instituted investigations about 1750, there may be noted the names of Abbe Bertholon (1785), Jallabert, Gardini, Ingenhauss von Carmoy, Vassali, d'Orooy, Rosiere, Bilsborrow (1797), Rouland, Humboldt, Senaebrer (1801), de Candolle (1806), Reuter, Sheppard (1840), Forster Beckeinstener, Hlubeck (1847), Herve Mangon, Mm. Prilleaux, (1861), Frestier, Barat (1875), Werner Siemens (1880), Deherein (1881), Grandeau, Leclerc, Celi, Wollny, Mecagoo, Mallet, Deletrez, Spechnew, Rivaire, Selim Lemstrom, Naudin, Carola, Bailey, Tallavignes, G. Bonnier and E. Lagrange (1892). There have been so many contradictory results that nowadays everyone looks skeptically at all that relates to electroculture. However, it must be borne in mind that negative results are without convincing force in the face of results that are positively demonstrated and are reproduced at will. All previous methods of electric cultivation have, more or less, completely failed; still this proves simply that these means were defective and does not involve the failure of a different method.

The new process of electroculture, invented by Brother Paulin, was studied by him in a series of experiments scientifically conducted, and is based upon a sufficient number of demonstrations to arrest attention. Brother Paulin devoted himself for an extended period to the study of electric culture, but when he had reached the point where he was convinced of the fact that electricity exerted a favorable influence on vegetable life, it was still necessary to pass from theory to practice, and to determine the best means of utilizing it. It is for this reason that his practical experiments date back only two years.

By a device of his own invention, which he calls a "geomagnetifere," he attracts electricity that is found in the atmosphere near the earth in consequence of meteorological phenomena, such as storms, rains, wind, etc., and distributes it in the ground in the vicinity of the roots of plants. The "geomagnetifere" is a resinous pole, ranging in height from 40 to 60 feet, which is planted in the ground, and which supports by means of porcelain insulators a galvanized iron rod, the latter terminating in five copper points as shown in the illustration. This collecting brush is connected by means of the rod with a system of wires 6 feet 9 inches apart, which distribute the electricity in the ground which it is proposed to influence. This area depends upon the height of the pole. An area of 30 areas (3,588 square yards) for example is allowed for a pole 15 meters (49 feet 2 inches) in height. In the illustration the wires are represented on the surface to indicate their arrangement; in practice they are buried to a depth of from six to eighteen inches. Such an installation lasts many years; the apparatus operates until the conductors are destroyed by rust.

The first experiment made by Brother Paulin was conducted in the spring of 1891 in a potato field belonging to a farmer in the suburbs of Montbrison. In July a report of the result was made in the papers to the following effect: "The attention is arrested at once by a marked irregularity in the vegetation in the field. In an exact circle in which the electric conductors are buried, the potato plants have a growth double that in the rest of the field. And this is true without exception; there is no gap in the group of five plants forming a circle as exact as if drawn by a compass."

Here is the report of the committee appointed by the Agricultural Society of Montbrison that awarded a medal to Brother Paulin: "A geomagnetifere twenty-eight feet in height exerted its influence over an area 65 feet 5 inches in radius. In this part of the field the stems of the potato plants have attained an extraordinary size and development, and have preserved at this time (September 23d) a freshness that contrasts very perceptibly with those in neighboring parts of the field. The stems were measured and were found to reach a height of 57.87 inches and .787 inches in diameter. After the first investigation the members of the committee designated for future comparison two portions of that part of the field traversed by the wires, each containing 16 squares meters, and two portions of the same size not subject to the electrical influence. These four patches of ground were not chosen for any particular reason except that they represented the average vegetation in both parts of the field. The 32 meters in the former area yielded 198 pounds of potatoes, while the same area in the uninfluenced portion of the field produced 124 pounds." The production per hectare (2.47 acres) in the first case would be 61,600 pounds and in the second case 41,140 pounds. This

1. Abstract of an article in *L'Illustration*.

result attained without any special fertilizing and with a common variety of potatoes equals the best crops obtained at large, expense with chemical fertilizers. On the 11th of October the difference was still more marked; 60 square feet in the area subject to the electrical influence yielded 1.38 pounds of potatoes, while a similar area in the other part of the field yielded 83 pounds.

The second experiment was made in a vineyard. The report states that the grapes ripened more rapidly and more steadily in the circle bounded by the wires than in the ground outside of it.

The following are some of the results obtained in the following year (1892). In the enclosure of the Brothers of the Christian Schools (Novitiate of Vals near Puy) a geomagnetifere 94 feet in height was erected on April 24th in a field of spinach sowed the previous year. From the first few days in May it was possible to notice a difference both in the vigor and color of the plants in the patch of ground in which the wires were buried. The contrast was marked by a straight line following the direction of the conductors. On the 14th of May plants in two areas of 5.40 meters each in the influenced and uninfluenced parts of the field were dug up with their roots, and were weighed. In the former area the total weight was 53.68 pounds, and in the latter case 44.34 pounds, or a difference of 1.91 pounds per square meter. On the 21st of May the difference was found to be 3.08 pounds per square meter, and six days later a commission of professors and agriculturists investigated the action of the geomagnetifere and found it had then produced a difference of 3.96 pounds per square meter. At Thueyts (Ardeche) spinach has been grown with leaves 13.78 inches in length, and celery 35.43 inches in height. At Tours the stems of the potato plants attained a growth of 96.45 inches; in Haute Loire the radishes and turnips reached a spendid size; at Orchies, the beet roots grown for sugar were of fine quality.

How does electricity produce these remarkable results? Does it act by means of the decomposition of the air and the fixation of the azote, or does it operate simply by making the useful elements in the soil assimilate more perfectly and rapidly? These are problems that are still to be solved.

The Thiele Bill and Socialism.

By Allen R. Foote.

In the issue of the Western Electrician for April 29th I notice your report of the views of Mr. Wilmerding on the "Thiele electric lighting bill" and your editorial referring to the same. Not having the bill before me I cannot discuss its provisions, but I am willing to accept your editorial statement that "this measure is thoroughly bad in principle antagonistic to legitimate enterprise, and will have a tendency to frighten capitalists who would otherwise invest in electrical work. The bill should be defeated."

From a long and careful observation of the progress of socialism in this country I conclude that the success it has met with is wholly attributable to the fact that those most directly antagonized by the movement—corporations supplying public services—have been placed at a disadvantage in their efforts to stay the rising tide of paternalism by the popular prejudices against corporate monopolies and trusts.

The popular prejudice against monopolies has made politicians and the daily and weekly newspapers—politicians in type—ever ready to dilate on the wrongs inflicted by them and the blessings to accrue from having them supplanted by public ownership of all public service industries. Another powerful influence is be found in the insatiable greed for political power always firmly rooted in the occupant of every public office and in every public employe. Politicians by sheer force of logic, as they reason, must advocate public ownership of these industries, because they wrongly assume that to advocate any other course would be a confession on their part of inability to manage public affairs. Editors of newspapers show the same dread of a damaging admission when they decline to publish a communication showing errors in their editorials or in articles which they have published with comments of approval.

I have seen no better statement of the dangerous growth of socialism than that made by Frank B. Tracy in his article in the *Forum* for May, 1893, on "Menacing Socialism in the Western States." I wish every one of your readers could be induced to read that article. To be told as they are there told, "in the deliberate and conservative judgment of the writer, that socialists constitute a majority of the citizens of the West" must have a startling effect on most of them. And then, when a little farther on the reader comes to the following statement, it can but cause him to pause and pass some time in serious reflection: "Every intelligent student must realize that unless the spread of socialism is checked, one of two conditions will certainly appear in time. One is the thorough paternalization of our government; the other is the political separation of the West from the East."

The remedy suggested by Mr. Tracy is an old and reliable one—the proper education of the masses. I am one of those who have complete confidence in the honest intentions of the average man. Unfortunately, honest intentions are not all that is required to cause political actions to result in sound economic procedures. Such results can come only from honest and well-informed political action. How can the average man become well informed regarding the economic conditions involved in the question of municipal ownership of electric lighting plants or any other public service industry? Some sentimentalist writes an abusive article about monopolies in general and clinches his argument by showing how cheap the city could get electric lights or gas, if the city would only destroy the monopolies by erecting and operating works of its own. The paper publishes his article as a sensation, just as it would a lurid account of a robbery or a murder. The average man reads it. Having no means of testing the correctness of the figures and no reason for disputing them, he accepts them. They are against monopolies, against capitalists and in favor of the people, in favor of honest labor.

The local company that finds itself in danger commences

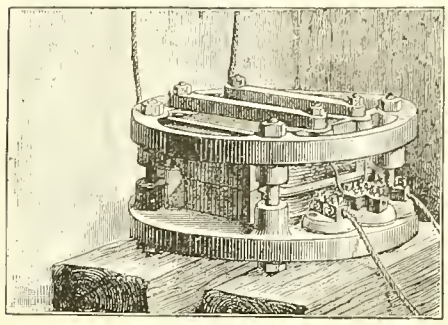

FIG. 3. ELECTRIC LIGHT STATION IN THE CHAMPS ELYSEES SECTOR, PARIS.

to write to all it thinks may help it, for statistics and arguments to be used against the craze. Some one takes up its case and writes an article suitable to it and sends it to an electrical journal, where it is sure to find a cordial welcome. It is published in such a journal and is never seen by the average man, the voter; who controls the destinies of state. In this way there has been sufficient evidence published in electrical and other technical journals during the last five years to satisfy any man with an intelligent reasoning mind that public ownership of public service corporations invariably results, and must inevitably result, in economic losses instead of economic gains for the people. Notwithstanding this the gains made by socialistic ideas during this same period of five years are astounding to those who take the trouble to keep themselves advised. This lost ground must be recovered and gains must be made for correct economic ideas, or, as Mr. Tracy says, our entire government will be transformed into one vast scheme of paternalism. This raises the question, How can the masses be taught correct economic ideas? To keep as near as possible to the subject that has caused the writing of this article, I suggest that whenever an article appears in any newspaper or other publication favoring any socialistic scheme, or giving figures showing the advantage of municipal ownership, that an article be written to refute the arguments, or to disprove the figures, and that it be published in the same newspaper in which the article to which it is an answer appeared. The objective point is to give the antidote to the same persons who took the poison, the readers of that newspaper. Let this course be persistently followed and its good effects will not be long in appearing. It must not be supposed that newspapers will be so eager rightly to educate their readers that they will be glad to publish articles correcting statements made in their editorials or in communications which they have accepted and speeches they have reported with approval. Not a bit of it. On the other hand, they will frequently find it necessary to decline such articles "for want of space." When this is done there comes the opportunity to show that some one is in dead earnest in following up the subject. The declined articles should be at once inserted as a paid advertisement. The publisher should be made to know that he will not be allowed, unchallenged, to corrupt the minds of his readers with misinformation. One other point: the article should be furnished by a writer known to have no invested interest in the industry attacked. If a bright, respectable, ambitious mechanic can be found in the town who will read up on the subject and sign the articles, their effect will be much greater than if signed by the president of the local corporation being attacked.

The political and economic questions involved in every discussion of socialistic schemes touch the interests of every public service corporation. As each must defend itself when attacked, the common danger and similarity of interests should bind them into one cohesive force, not only to repel all socialistic proposals but to take the offensive and deprive the sentimentalists of their power to pose as friends of the people through causing the people to see that their theories are subversive of industrial liberty and economic justice. To illustrate this point, one argument against the Thiele bill is found in an article by J. W. Mason on "Governmental Ownership of Railroads" in the *American Journal of Politics*. In this article Mr. Mason says:

"In the kingdom of Norway and Sweden much may be learned that is instructive. In 1888 there was a total of 4,591 miles of railway in that country; of these 1,551 miles were built, owned and operated by the government, while 3,040 miles were built and operated by private corporations. It cost the government to build and equip its road over $41,000 per mile. The private roads were built and equipped for a little over $22,000 per mile—a trifle more than one-half of what it cost the government. The roads, private as well as public, are under control of the government, with rates fixed by royal administration and approved by the king; and yet the private roads, after paying interest at four per cent. on a bonded debt of $12,800,000, pay a dividend of 3.24 per cent. on the capital invested, while the government roads, after paying operating expenses, show a surplus of but 2.41 per cent. of the cost. No comment can add to the force of these facts. I put them forward in proof that business industries cannot be so successfully and economically carried on by the government as by private enterprises."

The Thiele bill is intended to authorize municipalities to undertake the management of business industries. Politicians have never yet succeeded in managing business affairs as well as business men who have their own capital staked on the success of the enterprise. It is not in the nature of things that they should. They are not built that way.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

THERE seems to be a growing disposition on the part of the men engaged in electrical construction work to follow the policy of the older labor organizations and take advantage of the pressing needs of the corporations to extort excessive wages. Such a policy is short sighted in the extreme, and will ultimately react upon the laboring men. It will only serve to create a breach between employes and employers, and the former cannot complain if, when there is little work to be done, the employers retaliate by cutting the price of labor so as to average up on the general run. Such a condition of affairs is to be deplored as it is to the interest of both the employer and employe that friendly relations exist between them.

Elsewhere in this issue is presented a carefully prepared article by Allen R. Foote, which should command the attention of every man who is interested in any way in electric lighting, railway or power work. As is well known Mr. Foote has devoted considerable time to the collection of statistics on central station work and is thoroughly familiar with the subject. His experience has led him to conclude that the growing tendency in favor of municipal control of enterprises that should be conducted by private capital is due largely to erroneous statements published in daily newspapers and popular periodicals, and in the utterances of irresponsible politicians who hope to win favor by appealing to ignorant people who are ever willing to take a position against capital. Mr. Foote's plan is to refute all of these erroneous statements immediately after their publication, in fact to establish a literary bureau on a small scale in every locality where the central station men's interests are threatened. The scheme will bear consideration.

IT is now an assured fact that the electric lines in the South Chicago suburban district will be extended during the summer months and that within a year a comprehensive system of trolley lines will be thoroughly established in that section of the city. The ordinance providing for these important extensions has been passed and the mayor has expressed a willingness to approve it, upon the execution of a satisfactory agreement with the city electrician to insure non-interference with the city's electric system. A conference of the representatives of the company and the city resulted in the settlement of the terms upon which the work shall be conducted, the street railway company announcing its willingness to place the city's wires underground wherever the trolley lines crossed the city's circuits and take any other precautions which Prof. Barrett might deem necessary. This spirit of fairness manifested by the railway company is commended to the attention of other corporations seeking franchises from municipalities. They will find that the public will much more readily grant them concessions and that the companies will stand better in the estimation of the community. They will find, too, that a liberal policy will pay in the end.

AN interesting account of the manner in which electricity was utilized in the exercises at the opening of the World's Fair is given in this issue by Locke Etheridge, who tells "How President Cleveland Opened the World's Fair by Electricity." Mr. Etheridge had charge of the electrical arrangements and is well qualified to describe them. Up to the last moment there were many who believed that an electric signal would simply be sent by the president to men at the Allis engine and in the pump house, and that the steam valves on the big engine and fountain pumps would be opened by hand. It is satisfactory, therefore, to be assured that the electrical impulse caused by the pressure of the president's finger did actually control the mechanism by automatic action. Of course the result was not achieved without careful preparation and many rehearsals, and all concerned breathed more freely when the critical moment was passed, and the "button-pressing" episode had proved an entire success. All who witnessed the impressive scene at the opening will agree that the arrangements could hardly have been improved. The instant that President Cleveland touched the key the fly wheel of the Allis engine and the pulley of the great dynamo belted to it began to revolve, while the electric fountains spouted outside. At almost the same moment a large American flag on the central staff in front of the administration building was unfurled, while scarcely a second later the display of the ensigns of all nations became general from a multitude of flag-staffs on the beautiful buildings surrounding the grand central court. The spectacle was very beautiful and impressive and was greeted with tremendous cheering by the great concourse of visitors. The bands played and the boats in the basin screeched, but above all was the exultant shouts from seventy thousand human throats. That electricity should have contributed so largely to the success of this memorable celebration is a cause for gratification to all connected with the industry.

OFFICIAL consular reports during the last few years have directed the attention of American manufacturers of electrical machinery to the demand in foreign countries for the class of apparatus which they are supplying. One of the latest of these reports is that of John Fowler, United States consul at Ningpo, China, which has just been published. Consul Fowler has succeeded in arresting the attention of the taotai of the circuit in the subject of electric, steam and oil launches. As that official is obliged to travel a great deal through canals and rivers, he is naturally inclined to take advantage of the modern methods of transportation, especially in view of the fact that much higher speed may be attained and greater comforts enjoyed than under the old methods, which are still retained in the Orient. At present he is obliged to depend upon boats which cannot make more than 100 miles in three days, and which are propelled by scullers. The taotai is not the only person who would take advantage of improved forms of boats and means of propulsion. It should be remembered that this vast district is intersected by thousands of miles of canals and rivers, and although it covers a territory of 39,500 square miles and has a population of from 25,000,000 to 35,000,000 people, there is not a single launch or boat of any kind propelled by steam, oil or electricity, excepting a few launches that ply from Shanghai to Hangchow, the capital, 150 miles northeast of Ningpo. The conditions existing in China are much more favorable to the electric launch than to steam and oil launches. Objection is made to smokestacks on the boats, and only very low or short stacks would be tolerated. A boat "without a smokestack" would be very popular, according to Consul Fowler. Concluding, he says: "The canals are the only roads, and all travel is, of course, by boat. The traffic carried on by boats is very large. The introduction of quicker methods of travel would be highly appreciated, especially if the taotai sets the example, and I deem this a most auspicious time to introduce our methods into this province."

This is highly gratifying and encouraging to those introducing electric launches. That such boats can be built and operated economically there can be no doubt, and that they are deservedly popular is apparent to all who have witnessed their operation on the lagoons at the World's Fair.

SERIOUS attention is given the project of Prof. Lucien I. Blake of the University of Kansas to transmit electric power from the coal field to Kansas City. Prof. Blake is reported to have said that nearly one-half the price that the consumer pays for coal is for transportation. He proposes to build at each large mine an electric power house. He would generate electricity at the head of the shaft and transmit it to the city, where sub-stations could regulate the distribution of the current. He claims that power could be furnished at least 30 per cent. below its present cost and that by his plan the smoke nuisance would be abolished. Prof. Blake adds:

The cost of the electrical equipment can be only roughly stated. As proposed at Niagara Falls it is about $180,000 for 5,000 horse power units, which includes generators, exciters, transmitters and line for twenty miles, but not the motors. They would be paid for by subscribers. The line construction would cost something like $1,000 per mile. Thus it would seem possible to make a successful and commercial venture of such utilization of our coal mines. There is at least this to be said: Our best and most reliable electric companies would be ready to make estimates upon such a project and thus from this standpoint such a project warrants serious attention. Power is now conveyed by electricity 112 miles to Frankfort, Germany, with a loss of only 28 per cent. The plant lights 160,000 lamps and runs a twenty horse power motor. At Ouray, Colo., at Telluride and Portland, Ore., it is also transmitted cheaply by electricity, and a company is preparing to transmit power by electricity from Niagara Falls to Buffalo.

There is, according to the statement of Prof. Blake, enough coal within a radius of 50 miles to supply Kansas City for many years.

The plan prepared by Prof. Blake is of course feasible, but it is considered impracticable from a commercial point of view unless certain favorable conditions prevail. If, for instance, there was a coal mine at the foot of a mountain, and a rich mine located 10,000 feet above, it would probably be cheaper to transmit electric power up the mountain than to haul coal, but such conditions hardly exist in Kansas City. The whole question therefore resolves itself into whether it is cheaper to carry coal or to generate steam at the mouth of the coal pit, and transmit power electrically to the point where it is needed. If transportation is cheap and the distance great, it will of course be much more advantageous to carry the coal by rail or water and have a steam plant in the the center of distribution. If, on the other hand, the distance is comparatively short, and the cost of transportation very high, such as might be expected in a country cut up by mountains, forests or rivers, or where the point of application is situated near the mountain tops, electric transmission of power will be the cheaper. Generally speaking, it may be said that such schemes usually fail to attract capitalists for the simple reason that within a radius of 50 miles from a coal pit, coal is so cheap that it would be ridiculous to invest large amounts of money for electrical transmission plants, the interest on which would more than overbalance the cost of transportation of coal to the point of application.

An erroneous impression is conveyed by the statements attributed to Prof. Blake regarding the Frankfort experiments. It is well known that the Frankfort transmission plant was put up as an exhibition plant only, and in order to demonstrate the feasibility of power transmission at long distances from an engineering point of view, but it has never been a commercial success, and never was intended to be one.

A Sensational Charge.

[Special dispatch to the WESTERN ELECTRICIAN.]

BOSTON, MASS., May 8.—The Westinghouse Electric & Manufacturing company of Pittsburg on Saturday brought a suit against the General Electric company in the Supreme Judicial Court at Salem. The plaintiff filed a bill in equity in which it is alleged that the plaintiff has for some months suspected that the General Electric company was regularly and systematically receiving detailed information as to the prices the Westinghouse company was making to its customers, the new apparatus it was designing, the inventions made by its electricians and its business generally. It especially charge in its bill that many of the drawings and plans made in the designing rooms of the Westinghouse company got into the hands of the General Electric company very soon after they were prepared. The bill says: "About August 1, 1892, the defendant, the General Electric company, approached certain persons in the employ of the plaintiff who had access to the rooms in which the plans, blue prints, specifications and proposals were kept, and through secret negotiations and the payment of large sums of money bribed them to steal from the plaintiff from time to time thereafter and up to about the first of March, 1893, the blue prints of the most important and novel designs for apparatus machinery, and devices which were made from time to time by the employes of the plaintiff, and also to steal specifications and proposals of the character aforesaid."

The bill charges that these prints were given into the hands of E. Wilbur Rice, jr., of Swampscott and Walter H. Knight of Lynn, electricians and co-defendants in the action with the General Electric company. The bill then proceeds to give a list of the blue prints alleged to have been stolen. There are 180 of them. On May 4, 1893, the bill goes on to say, the plaintiff sued out a writ of replevin returnable to the Superior Court, County of Essex, on the first Monday of July, 1893. The sheriff of Essex county made a demand for the property in question, "but," the bill says, the "defendant refused to deliver up the property, and the deputy sheriff made a diligent search for the same in the premises of the defendant, in the office of the company, and particularly in certain drawers in the desk of said Rice, in which many of the said papers were known to have been deposited not more than six days prior to the delivery of the writ to the deputy sheriff, but the officer was unable to find the property or any part of it. The drawers of the desk in which the blue prints had been deposited six days before the issuance of the writ, and for some time previously thereto were empty. The prints had been removed therefrom and concealed by the defendants for the purpose of avoiding their being taken by said writ, and are now concealed by the defendants for such purpose"

The plaintiff prays: First, that the defendant may be ordered to deliver the blue prints and the copies of the specifications and proposals to the plaintiff; second, that the defendant may be enjoined from using the blue prints or from utilizing in any way any knowledge or information gained therefrom, and third, for such other relief as the court may deem meet. J. C. E.

A Chicago paper printed on Sunday a special dispatch from New York in which it was asserted that the Westinghouse Electric & Manufacturing company had charged the General Electric company with setting on foot a conspiracy to seriously injure the former by obtaining, by bribery and theft, plans of new electrical machinery designed by the engineers of the Pittsburg company. It was further asserted that a charge of criminal conspiracy, in which the officers of the General Electric company would be made defendants, would be pushed in the courts.

The gist of this serious accusation is contained in the following paragraphs from the article in question:

A few weeks ago the officers of the Westinghouse company were surprised to find that certain plans which they had made to be used in connection with their proposition for supplying a plant were identical with the plans which the company with which the Westinghouse people were to compete already had offered, and the engineer of the company said: "These plans are so similar that one of two things must have happened: Either you have stolen the plans from the General Electric company or they have stolen yours." The same experience occurred while negotiations were pending for contracts with the Niagara Falls Power company and again with a company at Sacramento, Cal., and once more at Providence, R. I. Therefore it was made apparent to the Westinghouse people that in some way their plans and specifications were being taken to the General Electric people.

It was felt by the Westinghouse officials that in self-protection some steps should be taken to find out how their business secrets were betrayed, and it was decided to employ the best detective skill that could be procured. This was done in the latter part of March, and a few days ago the detectives made their report. According to these reports, last July an arrangement was made with President Coffin of the General Electric, and William J. Clarke, who has been an able assistant to Mr. Coffin, and also with Morris Mead, the city electrician of Pittsburg, by which it was agreed that a competent man should be employed by the Westinghouse people, who would nevertheless be in the service of the General Electric company. They secured such a man, who has, it is said, made full confession to the district attorney of Pittsburg, and upon whose testimony the prosecution of Mr. Coffin and the others must be sustained.

A charge of felony was made against the city electrician of Pittsburg, Morris W. Mead, also against C. A. Coffin, the president of the General Electric company, William J. Clarke, Milton H. Hamilton, E. Wilbur Rice, Walter R. Knight, all of whom are prominent officers in the General Electric company.

A Pittsburg dispatch, dated May 6th, gives this information in addition:

Frank Carey, the Westinghouse draftsman charged with stealing blue prints at the solicitation of Mr. Mead and others alleged to be implicated in the conspiracy, was released from jail to-day on $500 bail. John Butler, the colored porter, who was arrested on the same charge, is still in jail, and will probably not be released before the hearing, which is set for 4 P. M. next Wednesday before Magistrate McMasters.

George Westinghouse, jr., dictated this statement: "The action which has been taken was an absolute necessity in view of the great injury being worked to the company by the conspiracy. But the matter is now in the hands of the officers of the commonwealth and must rest there, so that there is nothing which the company can properly say."

Later in the day Mr. Westinghouse made this additional statement: "In a letter just received from one of the engineers of the Westinghouse Electric & Manufacturing company at San Francisco, who was bidding on a plant for the transmission of power to the city of Sacramento, he writes as follows: 'You have, of course, heard the rumor that the General Electric company has obtained the drawings of our Niagara generator, and I think there is no doubt that they had all of the preliminary information which was sent to the Livermores as to the Sacramento plant before my arrival. The consulting engineer of the Sacramento company backs me up in this belief, because of the remarkable similarity in our plans.'"

The charge is vigorously denied by the officers of the General Electric company, who assert that the attack is made now to influence the selling price of General Electric stock. Mr. Clarke said that it was possible that his company had duplicates of Westinghouse blue prints, as customers had no difficulty in getting them, and by the same means the Westinghouse company might have got some General Electric blue prints. He characterized the search of his company's office at Lynn as vandalism.

Cincinnati Edison Company's Strike.

Cincinnati was much exercised last week over the rumored discovery of a plan to blow up the Edison Electric company's station. About three weeks ago the linemen in the employment of the Edison Electric Light company struck, and the company immediately declared a lockout. About two weeks ago a large number of city lamps were suddenly extinguished, leaving a portion of the city in total darkness. Investigation disclosed the fact that the circuits had been tampered with, and frequent repetitions of the occurrence led the company to place the matter in the hands of the police. Last week during a fire two men whose actions were considered suspicious and who were unable to give a satisfactory account of themselves were placed under arrest. A man impersonated Superintendent Davis of the Edison company, and obtained the prisoners' release. Now the Edison company claims it has discovered a plot to ruin its plant. It has found witnesses, it is said, to testify that the men who had been arrested were seen tampering with the company's wires. The case is in the hands of the police, and an effort will be made to account for the frequency of the "blow-outs" which have occured so often of late.

On May 2d L. W. Davis, the superintendent of the Edison Electric company, was found guilty of attempting to coerce employes into severing their connection with labor unions, and was fined $100 and costs by Judge Gregg.

National Electric Light Association.

There will be no summer meeting of the National Electric Light association. At the last meeting of the executive committee this question was decided.

A street railroad project, recently brought forward at Vienna, Austria, provides for an electric road for that city to be modeled somewhat after that at Buda-Pesth. Detailed plans for a belt line are said to have been already prepared, and arrangements to have been made for its construction by Siemens & Halske. The current is to be furnished by the General Austrian Electric company, which has just completed its second large central station at Vienna.

Relations Between Electrical and Insurance Interests.[1]

BY JAMES A. WATERWORTH.

In discussing the relations between electrical and fire insurance interests I speak as the local representative of one species of invested capital addressing the representatives of the other. The two interests are free and equal. They are subject to the same fundamental laws, governed by the same principles, operated under the same necessary conditions With both self-preservation is the first law. The permanent prosperity of both, however, depends also on observing the laws of comity with all their kind. This is the broad general relation they hold to each other, and to every species of invested capital—the relation of independent life and independent prosperity. Invested capital cannot escape from the mutuality of the relation; it cannot violate it in any of its forms and prosper for any length of time.

To come down from general principles to the personal relations of the two interests at that point where the practical details of electrical work meet the practical details of insurance, the point of contact and of friction, let us examine the two interests. They are free; each has its own special field; neither is in any wise subordinate to the other; each is possessed of the inalienable right of self preservation. And yet they are not independent of each other. There is a common ground on which they are compelled to meet and act, a point at which there is a common interest and at which they can mutually serve or mutually injure each other. At this point the solitary law of self-preservation is inadequate, and if alone would breed strife and loss. At this point, as on every common ground of human action, the law of comity—the law under which men agree to live and thrive together—furnishes the basis of their mutual relations, and accordingly as they occupy this ground intelligently and peaceably in like proportion will they occupy it successfully. Let us look at this common ground of operation for a moment.

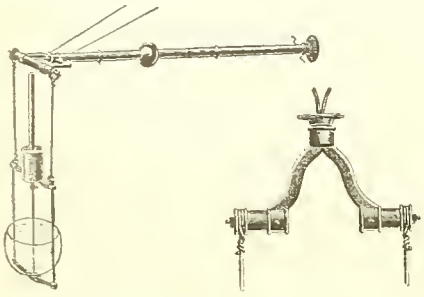
It is the lot of fire insurance companies to pay for all the improvements and experiments. This does not appear to be quite right; nevertheless public opinion seems to be agreed that this class of losses, due mainly to ignorance and in competence, should be charged up to insurance. It has been the greatest aid to progress the world has ever known, and has paid hundreds of millions to keep the industries of this country abreast of the times. It is a great, if involuntary, benefactor; but it can hardly be wondered at if under the circumstances the instinct of self-preservation is powerfully developed in the insurance interests.

Electricity was the latest novelty that presented itself to the conservative eye of insurance. The new comer did not make a favorable impression. It was a new and ubiquitous force; it was reported by its best friends to be erratic, whimsical and even dangerous. It was known that it would burn; it was said that it would kill, and it was believed that nobody knew much about it. It was popularly supposed that it took a conjunction of chemist and civil engineer to wire a building so that life and property would be safe. The coming king stepped on the stage with the reputation of an incendiary and anarchist. He claimed the right to enter every house and bring his incendiary habits with him. It was claimed that he could be permitted to enter and remain in a building with reasonable safety if—and here the electrical interests and the insurance interests met. Who was to decide under what conditions electricity could be introduced into our warehouses, factories and homes with reasonable security against setting the town on fire. Electricity brought with it a motley multitude of hangers-on and a foreign nomenclature. A new class of men, known as experts, seemed to spring like an exhalation out of all sorts of occupations—out of tinners' shops and plumbers' stores and out of boiler and engine rooms. These men knew nothing about electricity, but they soon learned to patter about volts and amperes and short circuits, and they paralyzed the boldest citizen with these and such like cabalistic expressions. They spoke with authority and claimed the right to decide what was safe and what was unsafe. In 1888 it took about three weeks to convert a mechanic into an electrical expert. The sudden growth of expert talent beat the record of Jonah's gourd. By a merciful dispensation the expert fungus perished as it had come—in a night. But while these men were contracting and doing work you may readily suppose they did not commend electricity to insurance companies as a harmless innovation. Some of the work done by them would make your hair stand on end. It is being condemned and taken out wherever found, often at great cost.

The insurance agent is rarely more than ten years in advance of the community in scientific matters, and I confess that he didn't know a bit more about electricity than the electrical expert. He wasn't so much scared by the electricity as he was by the expert talent. The insurance companies were scared, however. Whatever else they might or might not know about electricity, they knew they had to pay for it. They were right; they paid at once for the first central station in St. Louis—the Brush on Walnut street—and then they were sure that electricity was an incendiary of the first order. Do you blame them? I think that at that time, omitting a few men of technical education, there wasn't a man or boy, not even an insurance agent, in St. Louis that knew anything definite or practically useful about electricity; and much of the installation at that time was done by ignorant and incompetent men. That was the situation in the beginning, and I think the insurance companies were justified in keeping the law and practice of self-preservation well to the front. I am also free to say that I believe the situation in St. Louis was practically the situation in every city and town in the United States at the first introduction of the great modern power; it was in grossly incompetent hands. Every where throughout the

1. Abstract of a paper read before the Electric club of St Louis, April 15, 1893.

country property was being burned by imperfect electrical work. With every temptation to do it the insurance interests in St. Louis did not set themselves up as dictators to the electrical interests or take any advantage of the situation. From the start they clearly recognized and admitted. First, that they were face to face with the coming motive and illuminating power; second, that the electrical interest was clothed as fully as themselves with the instinct and right of self-preservation, and third, that the law of comity or profitable living and working together was the only law fairly applicable to the situation. The first set of rules governing electric installations was presented and recommended by a St. Louis electrician, who urged its adoption in the interests of the electrical business in St. Louis, and to restrain the conscienceless competition of ignorant and incompetent contractors. They were adopted for the mutual benefit of both interests, and the board set its best



FIGS. 2 AND 3. DILLON'S SUSPENSION BARS.

inspector to work to educate himself sufficiently to inspect the work done under the rules. These rules have been amended since by the joint action of insurance companies and electricians—your own body passing on the last edition. What has been attained in the last six years in perfection and safety of installation, in intelligence and competency of inspection, we have grown up to; we have educated ourselves up to; we have moved thereto with equal step. There is no place for the claims of small precedences in this business. The more scientific we are the humbler we shall surely be, for we know, and if we don't know our neighbors will remind us, from what depths of ignorance and with what painful effort we have climbed to the small eminence on which we stand, appropriating the discoveries of the very great investigators as fast as made, and growing great on what we fed on.

A prominent consideration determining the relations of the two interests is the authority, assumed or conceded, of making inspections. This may easily be made a ground of dissatisfaction and strained relations. But a little common sense will, I think, settle the matter. That inspection and control of electric installation is necessary and desirable, and beneficial to all, I think can not be doubted. It is certainly necessary for the insurance interests, which have to pay for all the losses caused by its dangerous defects; it is necessary for the electrical interests, if the conscientious contractor is to have a show, and if the credit of the business and the public confidence in its safety are to be maintained, it is necessary for the light and power companies who need some test of the instalations they supply, quite as much as the gas companies require a test of the gas pipes and fixtures they fill; and it is necessary for the public that it may quietly and securely enjoy the great modern boon of electric light and power. There may be and there is a question where this power of inspection and approval shall reside; with insurance, with electricians or with the public. As the greatest disaster, in case of dangerous defects, falls upon the insurance interests, as they are never quit of the risk, while the contractor is discharged of liability on payment of his bills, and as the absence of

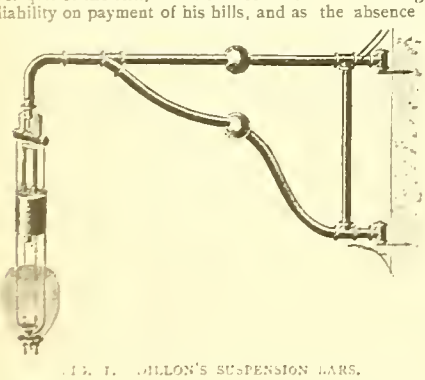


FIG. 1. DILLON'S SUSPENSION BARS.

the stimulus of direct personal interest tends to make the public official inspection superficial, the duty seems to have been wisely assumed by the insurance interest. It has most at stake. It would probably inspect on its own behalf in any case. If the general inspection be honestly administered to the benefit of all parties by this outside interest, which seeks only safety of installation, it is undoubtedly better to have it done by it, and to pay for having it done. As far as I am able to learn, there is no serious ground of complaint against inspection as at present conducted. Its rules and prices have been mutually agreed on, and the enforcement of the requirements has not been offensively made. The fruits of co-operating relations between the electrical and insurance interests in St. Louis are to be found on every hand. They are to be found first in the ability to secure the installation of any plant in the safest and most approved manner by harmonious action between us; second, in the fact which I think is apparent to all, that St. Louis is the best wired and best fitted city in the United States, and third, is not this association itself, and this meeting, one of the fruits of harmonious relations? The survival of the best and strongest elements in the electrical business; the dying out of the mushroom expert; the training and education of the men who had the mental and moral powers fitting them to live—all this I think is attributable in part to the high standard of requirements adopted for electrical work and the harmonious relations that secured its application. A curious proof of the thorough-going nature of the inspections in St. Louis was furnished in connection with a job done by a Chicago contractor in one of our largest stores. The requirements were well understood, and the understanding was positive, that the concealed work was not to be covered till it was inspected. But the inspector found the concealed work boxed up and the walls painted and decorated in fine style before the work had been inspected. The certificate was refused. The opening was to take place in a day or two. No threats nor objurgations of the Chicago man, who had never heard of such a high-handed proceeding in his life, nor even the entreaty of the merchant, the beauty of whose opening would be materially marred by tearing open the walls, could extort the certificate. We induced the merchant to stand firm and refuse payment till the certificate should be issued. The contractor was brought back from Chicago, the boxing was stripped off, and an incomplete, unsafe and skamped job stood revealed. It cost the fellow three days' work to make it right. When he got his certificate he swore he would not work in the town for $500 a month.

Whether electricity is a fire hazard when installed with all safeguards science can suggest is a question on which the two interests may not always agree; but I will say that in practice it has been decided in St. Louis in favor of the subtle fluid, which is admitted as an illuminator and as a power without charge for it as such. This would seem to remove the matter from the ground of a vexed question, and free the discussion of our relations from that issue. Undoubtedly from the insurance point of view the accumulation of many new and intense potencies, both of light and power and material—electricity among the rest—is forcing up the loss ratio of the country and slowly increasing the rates of insurance. There is none

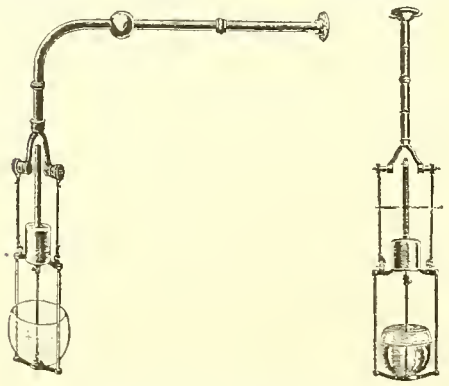

FIG. 4. DILLON'S SUSPENSION BARS.

of us wise enough to put his finger on the amount, proportion or nature of this increase of the fire loss due to the universal use of electricity. Personally, I believe that in all its uses, when properly installed, it is an improvement over that which it has displaced. The sum of all these influences is one of the marks and concomitants of our present progress and it would be more profitable to adjust ourselves to it than to protest against it. On this score insurance stands in precisely the same relation to the electrical interests that it does to all other interests and elements which enter into and create our fiery experience.

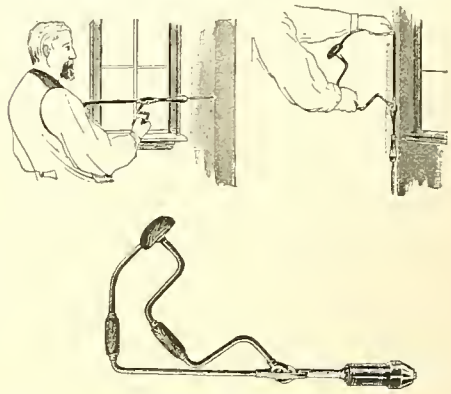
I am not competent, even at this late day, to talk electric talk to you, nor would I attempt it in this presence if I were. I know I know much less about electricity than I knew I knew five years ago. Probably some of you have had the same experience. It offers the vastest and richest field now open to human investigation; in its unexplored tracts it contains the largest elements of power, the mightiest factors of material prosperity, convenience, comfort and civilization left for the enjoyment of the last ages; in its domain man will achieve wonders of discovery, and by its aid exhibit marvels of power beside which all that the puny past can show will shrink into insignificance. The world will become a neighborhood, and the unity of the race will be accomplished. Into these things I cannot expect to enter save by faith and reasonable expectation. But I can, from the height on which we now stand and with the prospect now within our ken, see enough to justify me in protesting against the paltry and narrow suggestion that, for any vain dream of temporary advantage or visionary profit, it would be wise or necessary that the great interests under consideration should adopt the law of self-preservation as the sole rule to govern their relations toward each other, and abandon that higher law of comity and mutual help under which they have hitherto lived and thrived together.

Automatic Electric or Gas Lighter.

The accompanying illustration shows an automatic door spring electric lighter for gas and electricity, which has recently been put upon the market by the New York Electrical & Development company, of 281 Madison street, New York. It is similar to an ordinary door or window spring, and when the door is opened the automatic spring electric lighter turns on the electric light or gas light, as the case may be. The light is extinguished by opening the door the second time, and not by closing the door on entering, as might be supposed. On entering a vault, a refrigerator, a closet, or a room of any sort, the act of opening the door thereto turns on the light, the light continuing burning after the door has been closed and while the person is still within. Then on opening the door again to leave the room, the light is extinguished.

Dillon's Suspension Bars.

Central station men will be interested in the accompanying cuts representing a lot of very handy electric light fix-

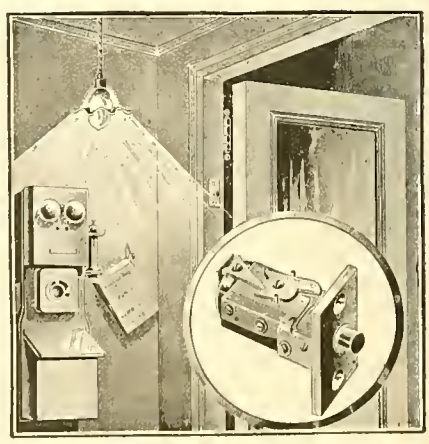


AMIDON'S CORNER BRACE.

tures. These suspension bars, as they are called by their designer, Thomas Dillon of Indianapolis, have a number of valuable features. They are made of one or one and one-quarter inch pipe and are intended to support arc lamps or groups of incandescent lights. By the use of these fixtures the wires may be kept out of sight, and with one of these suspension bars, according to Mr. Dillon, no more falling lamps are possible. Referring to the cuts. Fig. 1 represents a swinging crane for high lamp service, that is, for use with lamps in opera houses, hotels, etc. Figs. 2 and 3 show respectively the Dillon outside bar for general use and the yoke for suspension bar or for low ceilings and numerous other purposes. Fig. 4 represents another style of outside bar that is adapted especially for places where awnings interfere. Fig. 5 shows the Dillon inside suspension bar. This last mentioned style of fixture is highly ornamental, being made of either nickel, brass or iron. It should be mentioned in connection with these bars that a recent improvement has been made by the insertion of the switch on the bars just above the lamp. These suspension bars are handled by the Dillon Mast Arm company, Indianapolis, Ind.

Amidon's Corner Brace.

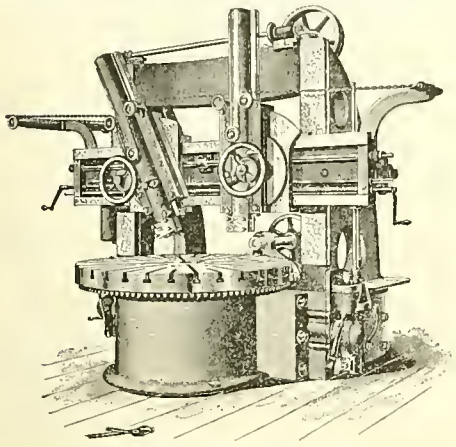
The accompanying cuts represent Amidon's corner brace and show the applications in which this tool is particularly useful. Wiremen will appreciate the features of this brace. The Amidon Tool corporation of Buffalo, N. Y.,



AUTOMATIC ELECTRIC OR GAS LIGHTER.

its manufacturer, claims that this brace bores fully ten to twenty times as fast as the ratchet brace, as the movement is round and round. It bores also very much easier, for two reasons: It is easier to turn round and round than back and forth, and the pressure coming on the arm of the brace instead of the sweep itself more power is gained. For heavy work or boring into hard wood, but especially for boring overhead, which is very severe work, either in a corner or in the clear, the superiority of the corner brace is apparent in the advantage gained by the pressure on the arm. In boring in the wall at the floor this advantage is highly appreciable,

as the foot can be used against the arm with good effect. The corner brace, however, is not confined to work in the corner or against a wall, but owing to the advantage just mentioned in the arm it will do much easier and just as good work in the clear as an ordinary brace. It will bore close into a corner; the ratchet brace, owing to the head, will not bore a straight hole within an inch and a half of the corner. In removing the bit and clearing the hole time is also saved, as the ratchet brace must be worked back and forth as in boring. In hardwood boring the bit is often loosened from the ratchet brace in the backward movement which cannot be the case with the corner brace. With the corner brace a straighter hole can be bored than with any other brace, as the eye is easily guided by the straight



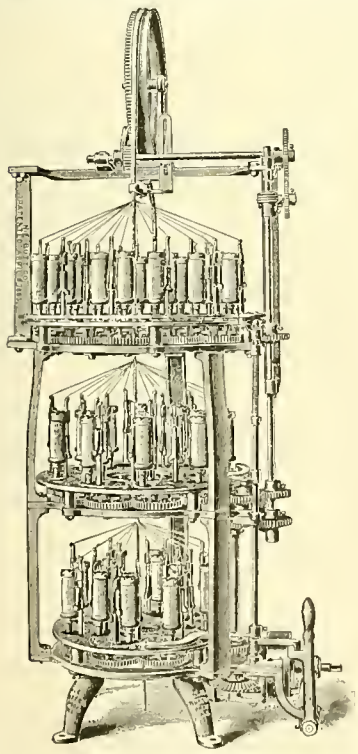
NEW BORING AND TURNING MILL.

rod, at the end of which the bit is held. The corner brace will not cripple by springing (bending) the sweep from heavy work, as the pressure, being on the arm, bears directly down upon the bit and not on the sweep.

New Boring and Turning Mill.

The accompanying cut illustrates a new boring and turning mill manufactured by the Bridgeport Tool Works, Bridgeport, Conn. It combines all the essential features of smaller mills of the same type and contains some new ideas which are not embodied in other mills.

The capacity of the mill is 62 inches in diameter and 42

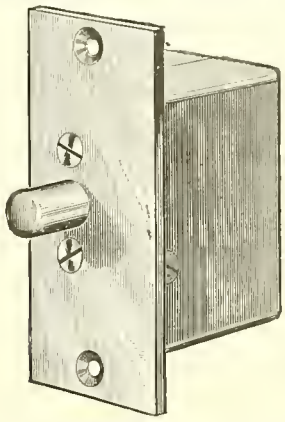


TRIPLE BRAIDING MACHINE.

inches in height. The table is 58 inches in diameter, is powerfully geared and has 15 changes of speed. The heads are constructed so that either one may be brought to the center, and can be set at any angle. They carry the tool bars, which have a movement of 30 inches. Each head has an entirely independent feed in any direction. The feeds are all positive and range from 3-64 to 3-4 of an inch horizontally and from 1-64 to 3-8 of an inch in angular and vertical directions. The weight of the machine is 20,500 pounds and it is self-contained.

Triple Braiding Machine.

The accompanying cut shows the New England Butt company's improved triple braiding machine. This is a large gear braider, in triple form, 16, 20 and 24 strand, with a 14 inch wheel take-up. It is made in the following combinations: Twelve and 16 and 20 strand, 12 and 16 and 24 strand, 16 and 16 and 16 strand, 16 and 20 and 24

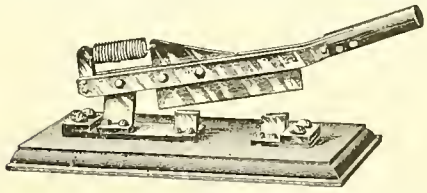


C. & S. FLUSH AUTOMATIC SWITCH.

strand, 16 and 24 and 24 strand, 24 and 28 and 36 strand. These machines can be supplied with iron scored rolls, if desired. The New England Butt company of Providence, which makes these machines, has excellent facilities to meet the exacting requirements of the makers of insulated wire in a most satisfactory manner. Braiding and cable covering machines made by this concern may be found in wire covering factories throughout the country. Many of these machines are made after special designs and for the performance of special work which could not be economically turned out without them.

The "C-S" Flush Automatic Switch.

The increase in the use of the incandescent electric light has developed a general inclination to adapt it to many special purposes. A recent addition to

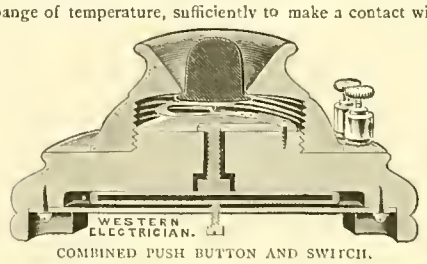


SNAP KNIFE SWITCH.

this style of goods is a flush automatic switch for use in bath rooms, dark closets, etc. sold by the Cutter Electrical Manufacturing company of Philadelphia. This switch is set flush in the rabbet of a door jamb in a manner similar to the familiar burglar alarm spring, and its action is strictly automatic. Every time the door is opened the light is turned on, and every time the door is closed it is turned off. Nothing can be disarranged by the accidental opening or closing of the door, at the wrong time, consequently it requires no attention or adjustment whatever after it is once set up. This switch may also serve as an efficient burglar alarm, as an intruder is at once confronted by a bright light upon opening a door. The cut presented of this article shows the switch complete in its fire and moisture proof casing.

Combined Push Button and Thermostat.

Charles E. Egan, of Chicago, has recently perfected a push button and thermostat combined which promises to meet with general approval. In the cut is shown a sectional view of the device. By means of two circular disks, completely sealed at their edges, an air chamber between them is secured, which expands and contracts with any change of temperature, sufficiently to make a contact with

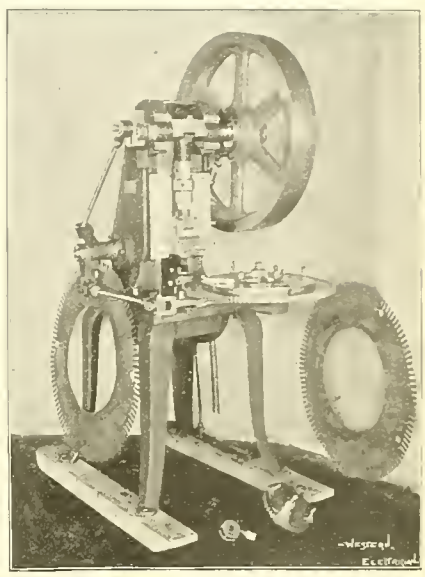


COMBINED PUSH BUTTON AND SWITCH.

an adjusting screw, which closes the circuit, thus giving the alarm. The circuit can also be closed by pressing the button, which in no way interferes with the workings of the thermostat attachment. The adjusting screw is readily operated from beneath, and enables a quick and easy adjustment to be made for any desirable degree of heat. In its construction, no fusible material of any kind is introduced, which must be replaced after use, or even a trial, and yet it is capable of such fine adjustment that it can be "set off" by the breath. The whole is finely finished, and in size is about as large as ordinary push buttons.

Bliss Press with Automatic Index Feed.

This machine is especially designed for cutting the notches in the circumference of armature disks for electric motors and generators. The disk is securely guided and clamped on the revolving plate, which at its lower edge has as many teeth as there are notches in the circumference of the disk. The operator starts the machine by putting his foot on the treadle, causing the disk to revolve one notch after each stroke of cutting punch. When the last notch is cut he releases the treadle, which causes the machine to stop ready for the introduction of another disk. The machine is adjustable in diameter from 10 inches to



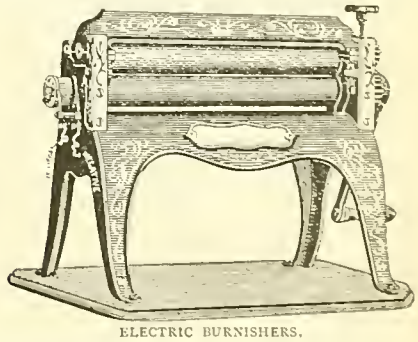
BLISS PRESS WITH AUTOMATIC INDEX FEED.

34 inches and more if required. The weight of the machine is about 1,700 pounds.

There are a number of these in use by large electric companies. They are manufactured by the E. W. Bliss company, 14 John street, Brooklyn, N. Y.

A Snap Knife Switch.

To meet the demand for a good snap knife switch that will have a positive and quick break action without complication, the C. & H. switch has been placed on the market by Cutler & Hammer, Chicago. This switch, which is illustrated in the accompanying cut, shows a length of break



ELECTRIC BURNISHERS.

greater than in most switches now on the market, which makes it particularly desirable for high tension circuits. As will be noticed, the design is extremely simple. It is made both dipped and polished; single, double or triple pole; is mounted on wood or slate bases, and has capacity from 15 to 1,000 amperes. It will undoubtedly meet with a large sale.

Electric Burnishers.

In the accompanying cut is illustrated the electric burnisher for photographic work, which is placed on the market by the Wales Manufacturing company of Syracuse, N. Y. In this machine the polishing roller has a resistance or heating coil suspended. A commercial current or a storage battery will heat the roller; therefore it can be set up in any place where electricity can be had. There is no limit to the amount of heat, and it is put under perfect control by means of a rheostat or switch at the end. Among the advantages claimed for this special style of

apparatus is the fact that absolutely uniform heat is secured, and that the machine can be heated in less than half the time required by other processes. The electric burnishers possess all the advantages of the oil machines and are practical and economical. The cost of running an electric machine is light, since current can be secured from a commercial circuit or a storage battery. Any desired amount of heat can be obtained in three minutes. Machines can be constructed for any current stated.

CORRESPONDENCE.

New York Notes.

NEW YORK, May 6.—Far overriding in interest every other subject discussed in electrical circles here this week has been the disastrous state of the stock market, and especially its influence on the fortunes of the General Electric company. On Wednesday the market was in a state of virtual panic. There were fluctuations of 2 or 3 points in many stocks between sales. Enforced liquidations were going on everywhere. Intrinsic values were lost sight of. Hardly a single stock on the list showed firmness, and the air was full of talk about impending failures. A prominent financial journal, in its Thursday issue, in commenting on the situation, said: "General Electric and Lead are the most affected. Lead is at the lowest price it ever sold, and so is General Electric. There are more or less vague hints that both companies are getting ready to follow the Cordage example and deluge the street with new securities." On Friday another Wall Street authority came out in a very flat-footed way on the subject: "Where the pinch is severest is with such companies as the General Electric trust and other over-capitalized concerns, whose assets consist of cats and dogs, with residences scattered all over the globe. All the trusts are a sale. They want money and they can't get it. General Electric stock has not taken its punishment yet. There is liquidation to come there. It may be delayed, but it is certain." Within a few hours of the publication of this startling prophecy the General Electric stock passed through an experience that has been seldom recorded in the fluctuations of Wall street. During the preceding Monday, when it started at 98¼, the stock dropped 3¼ points, and it closed on Wednesday at 88¼ and on Thursday at 79½. On Friday morning the air was filled with alarming rumors of pending failures, and shortly before 11 o'clock the suspension of S. V. White was announced amid great excitement. The news seemed to set the street crazy, and an avalanche of stock was showered on the market. By noon the irresistible tide of liquidation had carried General Electric down to 58, and the suspense as to what would next happen became intense. The stock, however, soon showed that it had active support in a quarter that is a tower of strength on the street, and at the close of the day had swung right back to 79½, nearly 22 points. The situation elicited from President Coffin a special dispatch, in which he said: "The General Electric has no pressing liabilities, no call loans outstanding, and has recently paid $2,000,000 of its obligations. The collections are not at all slow, and the company's factories are as crowded as ever to keep up with the orders." This was followed by a statement by John S. Wise, counsel of the General Electric company, to the effect that "the company has inventories, work in progress and stocks and bonds at a valuation, said to be conservative, in excess of $34,000,000, as shown in detail in the annual report, and the volume of the company's business is greater and its cash sales are much larger than ever before." These statements, even taken in conjunction with the firmer state of the market, have not had the effect of removing a sense of uncertainty as to the outcome of the next few days, and the developments of the ensuing week will be watched with not a little anxiety.

The discontent which has for some time been brewing among the linemen in Brooklyn has culminated in a general strike, and throughout the telephone, electric light and trolley railroad services $3 a day is demanded instead of $2.50, as formerly. The only company to accede to the workmen's demands is the Atlantic Avenue Railroad company, which has a great deal of construction work on its hands, and would be subjected to most serious loss if its operations were in any way arrested. The strike has been much strengthened by the co-operative action of the linemen of the New York & New Jersey Telephone company, which is already suffering seriously from the movement. It is said that complaints of poor telephone service are coming in at the rate of forty per day; only eight men are left to do the work of fifty, and quite a number of the subscribers are threatening to break their agreements if the service is not improved. It is regarded as possible that a general strike may be ordered throughout Hudson county. The Brotherhood of Electrical Workers claims to have about $14,000 in its treasury.

A meeting of the Rapid Transit commission was held yesterday, and another stage in the one-sided game that is being played by the Manhattan Elevated Railroad company and the city was entered. All the fencing and delays that have been inseparable from the negotiations for the provision of comfortable and efficient travel for the people of New York point to one result, that, in the long run, the citizens of New York will have to take whatever the Manhattan Railroad company chooses to give them. It seems hardly conceivable that any civilized community will put up with the frightful discomfort of daily travel that now obtains on the elevated roads. The inefficiency of the present capabilities of the Sixth avenue line was never more completely shown than in the transportation of the crowds of passengers that journeyed up-town to witness the illumination of the warships in the river. The stairs leading to the different stations on the line were in many cases so jammed that great numbers of people gave up the attempt to reach the platform. At some stations the crowd on the platform was so great that it was with the utmost difficulty that passengers could leave the car. The guards of the train were powerless. Most of them were forced to sit or stand on the brake-handles between the cars. They could neither open or shut the gates. Bad as was the journey up-town, the return was infinitely worse, and it was nearly midnight when the last of the weary and rain-beaten travelers were able to find a seat in the cars. At yesterday's meeting the railroad company presented an answer to the proposition which has been made by the commission for additional privileges. The company shows that the cost of constructing the extensions and new tracks proposed by the commission will cost $23,000,000. The company assures the commission of its desire to extend the lines, but objects to the proposed 5 per cent. tax on net earnings and presents these counter propositions: First, the Legislature has already settled what the road shall pay the city; second, that so long as $22,000,000 will be expended in extensions the advantage will be on the side of the city, as the company will have to pay the tax on this. The 5 per cent. arrangement is therefore not necessary. The company finally offers to pay 3 per cent. on the whole, or 5 per cent. on the new extension. The summing up of the answer sets forth that "in deference to the expression of the commission that the city should be compensated, the company is willing, although it deems it unjust, to agree to pay the city as aforesaid."

The announcement last week of the failure of Erastus Wiman, who is well known from the prominent part he has taken in the development of the resources of Staten Island, and especially in the providing of electric light for the community with which his interests have been so largely connected, occasioned but little surprise. His liabilities were estimated at anything over $600,000. It was known for some time that he was financially embarrassed, and while it is to be deplored that a man so prominent in the commerce of the city should meet with disaster, the failure is another indication of the distressed conditions now prevailing in commercial circles not only in this city but also in the South and West.

At length the cable cars are to begin to run down town. The new service will be in use as far south as Houston street. The cable is as yet running very stiffly, but is giving less trouble every day. Brakemen and conductors are being "broken in" on the cable cars now in use between Fifty-ninth street and Fiftieth street, and in a few days several additional cars will arrive for the extended service.

The American District Telegraph company has declared a quarterly dividend of 1¼ per cent., payable May 29th.

The Edison Electric Illuminating company of New York is now prepared to waive the 90 days' notice from bondholders, as required by the deed of trust, and to issue stock in exchange for the first mortgage convertible bonds.

W. F. O.

PERSONAL.

J. E. Hudson, president of the American Bell Telephone company, was in Chicago last week.

General E. S. Greeley, president of the E. S. Greeley & Co., New York, was in Chicago last week.

F. A. Scheffler resigned his position of general superintendent of the Brush company of Cleveland, O., April 1st, and has accepted the position of general sales agent of the Stirling company, manufacturers of the Stirling water tube boiler, with office at 74 Cortlandt street, New York.

The friends of Samuel Cochrane, jr., of Chicago, will be gratified to learn that hereafter he will be associated as assistant with Mr. Hoover, manager of the Standard Paint company 871 Rookery building. The rapidly increasing business of the company renders such an office necessary.

NEW INCORPORATIONS.

Electric Appliance corporation, Burlington, Kas.; to manufacture and sell electric appliances and felt soles.

Electric Light company, Ottawa, O; capital stock, $30,000; furnishing electric light, heat and power; N. E. Matthews, Ottawa, O.

Joplin City Light & Fuel company, Joplin, Mo.; capital stock, $150,000; to deal in fuels and manufacture gas and electricity; C. H. Malin, Joplin, Mo.

Canton General Electric Light company, Canton, S. D.; capital stock, $25,000; supplying electric light, heat and power, etc.; C. E. Judd, Canton, S. D.

Columbian Electrical Works company, Denver, Colo.; capital stock, $50,000; buying, selling and manufacturing all kinds of electrical machinery and goods.

Richmond Electric Light company, Richmond, Mo.; capital stock, $18,000; operating electric light plant; Richmond Electric Light company, Richmond, Mo.

Des Moines Electric company, Des Moines, Ia.; capital stock, $600,000; to establish, maintain and operate an electric water power plant; Lowry W. Goode, Des Moines, Ia.

Post-Glover Electric company, Cincinnati, O.; capital stock, $50,000; dealing in and manufacturing electrical and railway supplies, etc.; Richard P. Ernst, Cincinnati, O.

Mount Vernon Electric Light company, Mount Vernon, Ill.; capital stock, $20,000; to furnish electric lighting for Mount Vernon; Mount Vernon Electric Light company, Mount Vernon, Ill.

Waring Electric company, Hartford, Conn.; capital stock, $5,000; to buy, make, use and sell apparatus in connection with which electricity is used, etc.; E. D. Robbins, Wethersfield, Conn.

Wilkesbarre & East Side Railway company, Wilkesbarre, Pa.; capital stock, $50,000; constructing and operating an electric railway in Wilkesbarre, Pa; William Myers, Harrisburg, Pa.

Abatis Electric Manufacturing company, Chicago, Ill.; capital stock, $50,000; to manufacture and sell electric appliances, supplies, etc.; E. O. Partridge, 356 Rookery, Chicago, Ill.

Gallitzin Electric Light company, Gallitzin, Pa; capital stock, $20,000; supplying light to the public by electricity at Gallitzin, Cambria county, Pa.; Gallitzin Electric Light company, Gallitzin, Pa.

Luzerne, Dallas & Harveys Lake Railway company, Luzerne, Pa.; capital stock, $100,000; constructing and operating an electric railway in Luzerne county, Pa.; J. B. Reynolds, Wilkesbarre, Pa.

Media, Middletown, Aston & Chester Electric Railway company, Media, Pa.; capital stock, $30,000; constructing and operating an electric railway in Delaware county, Pa.; Edmund Jones, Chester, Pa.

Western Electric Power & Light company, Topeka, Kas., and El Reno, Okla.; capital stock, $50,000; to build and operate electric plants for manufacturing and selling electric power and light.

Parkersburg & Oxford Electric Railway company, Mifflintown, Pa.; capital stock, $100,000; constructing and operating an electric railway in Chester county, Pa.; Robert McMeen, Mifflintown, Pa.

Edison Electric Light & Power company, Meridian, Miss.; capital stock, $50,000; to conduct a general electric light and power business in the city of Meridian; C. W. Gallagher, Meridian, Miss.

St. Joseph Traction & Lighting company, St. Joseph, Mo.; capital stock, $1,700,000; operating cars by means of cable, electricity, horses, and dealing in machinery; Amick & Brown, St. Joseph, Mo.

Messer Elastic Rotator company, Philadelphia, Pa; capital stock, $10,000; to manufacture and sell machinery, wheels and mechanical appliances; Alfred S. Miller, 313 Drexel building, Philadelphia, Pa.

Wirt Laboratory company, Chicago, Ill.; capital stock, $10,000; to manufacture and deal in patents on articles pertaining to electrical business; Francis W. Parker, 1007 Opera House building, Chicago, Ill.

Townsend Gas & Electric company, Seattle, Wash.; capital stock, $150,000; to construct, maintain and operate light, heat and power plants, telephones, water works, etc.; W. J. Grambs, Seattle, Wash.

Hanover Light, Heat & Power company, Hanover, Pa.; capital stock, $25,000; supplying heat, light and power by means of electricity at the borough of Hanover, York county, Pa.; C. E. Ehrehart, Hanover, Pa.

Economy Electric company, Chicago, Ill.; capital stock, $1,500,000; to build, own, operate, lease, buy and sell electrical machinery and appliances; Economy Electric company, 913 Pontiac building, Chicago, Ill.

Chicago Insulated Wire company, Des Moines, Ia.; capital stock, $200,000; to manufacture, buy, sell and deal in all kinds of metals, appliances, fixtures, etc., used in electric lighting; C. E. Hunn, Des Moines, Ia.

Frisbie Elevator & Manufacturing company, New Haven, Conn.; capital stock, $70,000; to manufacture, buy, sell, own and deal in elevators and machinery, electrical devices, etc.; W. M. Frisbie, New Haven, Conn.

Royal Arc Electric company, Plainfield, N. J; capital stock, $1,000,000; to manufacture, operate and deal in

apparatus for producing and transmitting light by electric means, etc.; Frederick C. Marsh, Elizabeth, N. J.

Williams Bay Hotel company, Chicago, Ill.; capital stock, $150,000; to manage and operate hotel, electric light and gas plant, water works, livery stables, etc.; Frank E. Baker, 161 La Salle street, Chicago, Ill.

Chicago Dock & Investment company (incorporated in Virginia), Chicago, Ill.; capital stock, $12,000,000; to buy, own and sell machinery and merchandise, motive power, water works, etc., elevators, docks, stock, yards, etc.

Pittsburg, Greensburg & Latrobe Electric Railroad company, Tyrone, Pa.; capital stock, $1,000,000; constructing and operating an electric railway in Westmoreland and Allegheny counties, Pa.; Stevens & Owens, Tyrone, Pa.

Northwestern Water & Light company, Le Mars, Ia.; capital stock, $200,000; erecting, purchasing, maintaining and operating water works and electric light and power plant; Northwest Water & Light company, Le Mars, Ia.

Frankford, Bridesburg & East Fairmount Park Railway company, Philadelphia, Pa.; capital stock, $78,000; constructing and operating an electric railway in Philadelphia, Pa.; John G. Lamb, 210 South Fourth street, Philadelphia, Pa.

Philadelphia & Fox Chase Passenger Railway company, Philadelphia, Pa.; capital stock, $75,000; constructing and operating an electric railway in Philadelphia, Pa.; Henry S. McCaffrey, 2700 Germantown avenue, Philadelphia, Pa.

Second Avenue Traction company, Pittsburg, Pa.; capital stock, $1,000,000; constructing and operating motors and cables, etc., for supplying motive power to passenger railways; Geo. C. Wilson, 507 Times building, Philadelphia, Pa.

Bellaire, Bridgeport & Martin's Ferry Street Railway company, Bridgeport, O.; capital stock, $250,000; constructing, maintaining and operating electric street railway from Bellaire, through Bridgeport, to Martin's Ferry, O.; Thomas W. Sanderson, Youngstown, O.

Youngstown & Canfield Electric Railway, Light & Power company, Youngstown, O.; capital stock, $65,000; constructing and operating electric railway between Youngstown and Canfield, furnishing electric light and power, etc.; J. Calvin Ewing, Youngstown, O.

Martinsville Street Railway company, Martinsville, Ind.; capital stock, $25,000; constructing, owning and maintaining a street railroad upon each and every street, alley and highway of Martinsville, and the use of electricity and electric motors as a motive power thereon.

Electrical Fire Works & Construction company, Chicago, Ill.; capital stock, $100,000; to manufacture and deal in electrical fire works and machinery, electrical apparatus, appliances, machinery and devices, and operate same, and do general electrical construction business; Ball & Barrett, 1504 Unity building, Chicago, Ill.

ELECTRIC LIGHTING.

Glasgow, Ky., is talking of an electric light plant.

An electric light and water works plant is to be put in at Ontonagon, Wis.

The Massachusetts Reformatory in Boston will have a $12,000 electric lighting plant.

The Edison Electric Power & Illuminating company will enlarge its plant at River Point, R. I.

William Spiers has applied for a franchise to establish an electric light plant at Washington, N. J.

The Thomson-Houston Electric Light company intends to erect an electric light plant at Newport, Ky.

A proposition is to be submitted to the citizens of Forrest, Ill., to authorize the purchase of an electric light plant.

Over forty miles of wire will be used on board each of the two new mammoth Cunard steamships, Campania and Lucania. Each ship is to have a powerful search-light and about 1,350 incandescent 16 candle power electric lamps.

The electric light is gradually making its way into the most remote districts in Ireland. In the County Donegal, in the extreme north, an installation is being put down at the residence of J. Watt, Esq., of Romelton. It is intended to use an oil engine of the Hornsby-Akroyd type, directly connected to a Norwich compound dynamo. A set of accumulators of the E. P. S. type is included.

ELECTRIC RAILWAYS.

It is proposed to establish an electric tramway between Atami and Odawara, Japan.

The street car company of Yuba City, Cal., contemplates an extension of its lines.

The street car system of New Albany, Ky., is being furnished with a trolley system and will soon be in running order.

An extension of ten miles is soon to be added to the tracks of the Consumers' Electric Light & Railway company of Tampa, Fla.

The street railway company of Aurora, Ill., has been granted permission to extend and operate its lines on several streets of the city.

It is proposed to build an electric car line from Toledo, O., to the bridge over Ten Mile creek at Cramers with a view of extending it to Monroe and Detroit.

The Chicago & Evanston electric railway is for the most part completed and ready to begin operations, but it will probably not be possible to run cars until in the neighborhood of June 1st. The reason for the delay is city work on sewers and other street excavations.

TRADE NEWS.

The Chicago office of the Hill Clutch Works of Cleveland, O., will hereafter be 850 Rookery.

The Consolidated Electric Storage company, formerly of 120 Broadway, New York, will hereafter be located at the Edison building, 44 Broad street, New York.

The C. & C. Electric Motor company, New York, in addition to its branch offices in Chicago, Boston and Portland, Oregon, and a dozen other cities throughout the United States, on May 1st opened another in Philadelphia. The new office is under the charge of Geo. H. S. Young.

The Commercial Electric company of Indianapolis has just issued a catalogue describing its dynamos, motors and power generators. The catalogue is profusely illustrated. These machines have already been described in the WESTERN ELECTRICIAN and their special features are well known to the trade.

The Redding Electric company of Boston, Mass., manufacturer of electrical specialties, has recently issued an illustrated and descriptive catalogue of its lines of snap switches, cut-outs, push-buttons, etc. The book is well illustrated, is concise in descriptions and presents an attractive appearance.

Clark & Marshall, dealers in electrical specialties, 345 Rookery building, Chicago, are representing the Boston Incandescent Lamp company. This company claims to repair burned-out lamps in a manner which makes them as good as when first made. Clark & Marshall also have on hand a large line of electrical specialties, and are prepared at all times to bring them to the attention of the trade.

Thomas Dillon of Indianapolis, Ind., is hard at work introducing an improved fan for summer restaurant service. Mr. Dillon believes in mechanical refinements, and is now fitting up all his fans with ball bearings. By this improvement the saving in money for monthly power bills is considerable—at least the Indianapolitans are now testifying to this effect.

Word has been received from Louis Nahm, secretary and treasurer of the American Electric Manufacturing company, manufacturer of incandescent lamps, St. Louis, Mo., that the company has resumed its business after having doubled its capacity and is turning out a better grade of lamps than ever. The American incandescent lamp has an established reputation that makes it unnecessary to dwell upon its merits.

The Ansonia Electric company, Chicago, announces that it is now ready to take orders for the Sunbeam incandescent lamp. At the present time the factory output will not permit of the immediate shipment of all orders as fast as they are being received, but the company hopes shortly to find itself in position to fill all orders promptly. This lamp, the company claims, has been thoroughly tested and will be found entirely satisfactory.

The magnificent temple erected by the disciples of Brigham Young at Salt Lake City, Utah, is thoroughly equipped with all the latest devices for electric lighting. E. G. Holding, of Salt Lake City, installed the electrical work, and all the devices were manufactured by the Bryant Electric company, of Bridgeport, Conn. The workmanship throughout is fine, and Mr. Holding can certainly feel proud of portion of the his work.

In connection with the opening of the World's Fair by electricity much attention was attracted by the large single Ajax cell delivered by the Ansonia Electric company of Chicago to the exposition authorities for this purpose. This giant battery is 30 inches high and 12 inches in diameter. Several ordinary-sized cells of Ajax battery furnished a portion of the current used for the circuit operated by the president when he set the Allis engine in motion by electricity.

The General Incandescent Arc Light company, New York, has taken the agency in the United States and Canada for the arc light carbons and carbon brushes manufactured by Fabrik Elektrischer Beleuchtungskohlen in Nurnberg, Actiengesellschaft vormals Ch. Schmelzer. This will make it possible for these high grade carbons to be purchased at prices comparing favorably with domestic carbons, which are recognized as inferior in some respects to the imported grade.

Messrs Bergtheil and Young, of 13 Walbrook, London, E. C., electrical engineers, inventors, etc., are seeking American electrical specialties for introduction into the European markets. The firm is said to bold a high rank in England. Arthur Bergtheil, the senior member, is expected to arrive in this country this week for a brief stay, and it is his intention to take in the World's Fair, and during his sojourn to visit the larger electrical firms and ascertain what specialties there are of value to the English market.

Wm. Hubbard & Co., representing the Elgin telephone, have just removed from 116 La Salle street, Chicago, to suite 55 Merchant's building, 92-94 La Salle street, where they now have increased facilities for their rapidly growing business. Mr. Hubbard, it should be stated, is making quite an extensive exhibit at the World's Fair. His space is in the southeastern portion of the electricity building, in the gallery. Mr. Hubbard's well known acoustic telephone has been very much improved and he states that a number of important patents have been recently taken out on new features of line construction.

The Mica Insulator company, 218 Water street, New York, reports increased sales for its micanite insulators. Besides the leading electrical manufacturers in this country and abroad, who have adopted this method of handling mica, it is being used by electrical street railway companies for repairing their motors and generators. Taking into consideration the great saving in cost over using mica in the regular sheet form, it may pay any one wishing the best insulator to investigate micanite.

The Emerson Electric Manufacturing company, St. Louis, Mo., has issued an illustrated catalogue and price list of its large assortment of Meston alternating current motors. Particularly interesting is the display of fan motors presented by this company, which is complete and tasteful. Another specialty illustrated is the alternating current dental motor. The alternating current sewing machine motor receives a large share of attention and presents a number of novel features.

One of the most complete establishments for the manufacture of bicycles in the country is the factory of the Stokes Manufacturing company, Carroll avenue, Chicago, where the "Sterling" is made. The factory is turning out 25 complete machines per day and is still behind in its orders. Special machinery is employed and in all departments the greatest care is taken to produce only perfect parts. The general office and salesrooms of this company are situated at 293 Wabash avenue.

It was announced some time ago that the Western Electric company had filed a bill for an injunction against the Potomac Electric company of Georgetown, D. C., and also that the company's indebtedness was over $50,000 and largely in excess of its capital stock. As a matter of justice to the Potomac Electric company it should be stated that its troubles with the Western Electric company have been satisfactorily settled and that there is no bill for an injunction against the company, filed by the Western Electric company.

Perhaps no manufacturers of electrical machinery and specialties ever sprang into existence under more favorable auspices than the Muncie Electrical Works, Muncie, Ind. It has been before the public only about six months, but already it finds itself unable to meet the orders that are constantly pouring in. It has at the present time orders that it will be impossible to fill during the next six months. This company handles a particularly fine line of dynamos, motors, power generators, etc., and deals in arc and incandescent lighting apparatus extensively.

Repeated indorsements are constantly being received by the American Silk Manufacturing company of Philadelphia, of its patent silk machine wipers. As a matter of economy and safety the company claims no engine room should be without them. They have been recommended and indorsed by the boards of fire underwriters in St. Louis and Philadelphia, which said of them that they fully sustained the claims made for them. The success of a wiper, for which it is claimed that it is made of the finest material for polishing in existence, that it costs only half as much as common waste, that by its use there is no danger from spontaneous combustion, and that it contains no fibers to get into oil cups, is certain.

C. E. Woodruff & Co., successors to the Globe Supply company of Chicago, are now situated in their quarters at 235 Lake street, Chicago. This firm is the western agent for a number of electrical specialties, and, beside carrying a full line of electrical supplies, is ready to equip general stations in all branches upon a moment's notice. C. E. Woodruff, at the head of the firm, has been well and favorably known in the wire and general supply business for the last ten years. He is associated with Andrew Shillinglaw and J. F. Figel, the former for 13 years superintendent of the electrical department of Armour & Co., and the latter for a long time connected with the rubber and leather business.

The Menominee Electric & Mechanical company, Menominee, Mich., is presenting two very satisfactory fan motors for direct currents to the public. Type No. 1 is designed for direct current of any voltage, and includes a seven and one-half inch fan and lamp socket. No. 2 has three different speeds, regulated by switch on top of motor and is designed for direct current of 100 or 110 volts. It carries either 12 or 16 inch fans. The same company has a good switch in its spiral spring lever snap switch which has been so successfully introduced. It is substantially made, properly porportioned and mounted on slate base. The spring causes an instantaneous break across the lines of contact simultaneously and prevents arcing.

BUSINESS.

The Ball Engine company, Erie, Pa., has closed an order with H. F. Watson, paper manufacturer, Erie, Pa., for a 500 horse power Gross compound engine.

The Bradford Electric Light company, Bradford, Pa., has recently closed a contract with the Ball Engine company, Erie, Pa., for a 200 horse power single cylinder engine.

P. C. Ackermann, manager of the New York office of the American Electrical Works, Providence, R. I., has secured for his company an order for 40 miles of wire, which is one of the largest contracts awarded to any wire company since January 1st.

The Standard Paint company of New York is sending to the trade an attractive little pocket-size catalogue and price list of the various P. & B. electrical compounds, and also containing several testimonials regarding the merit and satisfaction given by the goods handled by the company.

The Page Belting company, Concord, N. H., has lately completed and occupied several new buildings. The largest building is the belt shop, three stories high and 264 by 58

eet, and it is fully equipped with new and special machinery for the manufacture of belts.

The Nutting Electric Manufacturing company has secured new quarters for manufacturing at 128 and 130 South Clinton street, Chicago, and is rapidly recovering from its loss by fire. Preparations are being made for the extensive manufacture of the Nutting arc lamp.

The Iona Manufacturing company, Boston, makers of electrical supplies and specialties, of which N. Marshall is manager, has removed its factory to much larger and more commodious quarters at 336 Congress street. By this change its capacity will be more than doubled, and will enable it to take care of all orders hereafter with promptness.

The Ansonia Electric company, formerly the Electrical Supply company of Chicago, recently placed on the market a switch known as Wood's new adjustable switch. The success of this specialty justifies the claim of the company that it is one of the best switches known to the trade. It is made with adjustable tongues, which will allow it to be used as a right, left or diamond turn-out.

Taylor, Goodhue & Ames are getting their exhibit in electricity building at the World's Fair rapidly near completion and will shortly have an interesting exhibit to show to visiting electricians. Their alternating current motor will be especially worthy of careful attention, and will, no doubt, excite considerable interest among those who are interested in the development and utilization of the alternating current.

The Ball Engine company, Erie, Pa., continues to place its engines in a manner which cannot be other than satisfactory to the company. The New York office recently sold a 125 horse power engine to the Far Rockaway Electric Light company, Far Rockaway, Long Island. The Brockton Street Railway company, Brockton, Mass., has ordered a second 600 horse power cross compound engine of this company.

The Phœnix Iron Works company, Meadville, Pa., have sold the Saginaw, Mich., Power company two 300 horse power Dick & Church tandem compound engines. These engines will each be coupled directly to a 200 kilowatt generator. It has also sold the Wyandotte & Detroit River Railway company another compound engine of 150 horse power capacity. It has also closed a contract for eight horizontal tubular boilers for the street railway plant at Allentown, Pa.

The Pelton Water Wheel company reports an active business in its wheels and motors, both from San Francisco and New York branches. Among the recent installations made by this company may be mentioned the San Antonio light and power plant and the Redlands light and power plant, both in California. These plants are important on account of the distance the power is transmitted, being 28 miles in the first instance and 12 miles in the latter.

The business of the Nowotny Electric company, Cincinnati, O., has grown to such an extent that it has added another floor to its factory. It is now occupying three entire floors, and has put in a full line of modern machinery. It is especially prepared to do all kinds of electric repair work, such as winding armatures, re-building machines, making commutators, etc. In addition to this it carries a full line of electric light and street railway supplies.

The Electrical Appliance company of Chicago is pleased to announce that the new Whitney volt meters and ammeters for alternating current work are now ready for the market. The company claims to have overcome the difficulty heretofore experienced with the alternating instruments caused by varying frequencies, and to have produced an instrument that can be placed on any circuit without a special recalibration and give absolutely correct readings.

The Genesee Electric Light & Power company of Genesee, Idaho, is running in its new quarters just completed, 1 new 100 horse power Buckeye engine, 2 Edison incandescent dynamos, 1 American Brush arc dynamo, with Oscar Erickson electrician, and Chas. Hough engineer. The officers of the company are: president, D B. Grant; vice-president, W. Harris; secretary, C. F. Burr; treasurer, L. K. Krum; manager, H. Sampson.

The Star Electric Lamp company, manufacturer of the new Sunbeam high-grade incandescent lamp, has made a very good impression on the trade by its energetic and successful work in bringing out so quickly a new lamp and being ready so soon for immediate delivery of goods. What the lamp purchaser wants is lamps, and the Star company is now not only ready to take orders, but it is prepared with a good stock from which to make prompt deliveries. Secretary A. S. Terry of the company reports that there is a gratifying and growing demand for the new lamp and that purchasers are showing their appreciation not by congratulations only, but by orders.

Clark & Marshall have now got settled in their new quarters, 345 Rookery, Chicago, where they are carrying a complete line of choice electrical specialties. They are now ready to take orders for their new model fan motors. The company's motive power is chiefly electricity, and it possesses an elaborate system of electric lighting in its buildings and on its grounds. A belt was completed by this company recently for exhibition at the World's Fair which is claimed to be the longest in the world. It is 102 inches in width and over 200 feet long. Two other large belts have been turned out, one 72 inches and the other 73 inches in width which are to drive Westinghouse dynamos for lighting the buildings at the fair.

Riehle Bros. Testing Machine company, Philadelphia, is installing an extensive exhibit at the World's Columbian Exposition, machinery building. The exhibit is in charge of J. R. Matlack, jr. At the government building in the government exhibit, in charge of Capt. A. H. Russell, will be found a Riehle 200,000 pound vertical screw power testing machine; and in the quartermaster's department in the government building a 200 pound cloth testing machine. These were loaned by the Riehle Bros. Testing Machine company to add to the government exhibit. An exhibit of the Riehle-Robie patented friction less ball bearing screw jacks will be found in the government exhibit, as well as in the space of Riehle Bros. Testing Machine company.

Taylor, Goodhue & Ames have just moved into their new store, 348 Dearborn street, Chicago, where, although they are not yet fully settled, their rapidly increasing business can be handled to the best satisfaction of customers. They report an unusually large demand for Wagner power motors, fan motors and their large line of transformers. This company, although but recently in the market for business, has experienced a very flattering demand for its goods and recognition among electrical buyers throughout the United States, Canada and Mexico. This company is making rapid advancement in development of electric heating and cooking devices under the Burton patents, and is now placing upon the market all styles and designs for electric cooking utensils. There have been many practical improvements in cooking devices, made under the Burton patents, and it is claimed that they may be operated with much greater economy than other designs.

ELECTRICAL PATENTS.

Issued May 2, 1893.

496,402. Musical Instrument. Richard Eisenmann, Berlin, Germany.

496,409. Electric Arc Lamp. Frits Hansen, Leipsic-Reudnitz, Germany.

496,427. Electrically Operated Overhead Traveling Crane. William H. Morgan, Alliance, O.

496,428. Locomotive Crane. William H. Morgan, Alliance, O.

496,429. Gravity Brake for Vehicles. William H. Morgan, Alliance, O.

496,430. Locomotive Jib Crane. William H. Morgan, Alliance, O.

496,432. Magnetic Crane. William H. Morgan, Alliance, O.

496,433. Pillar Crane. William H. Morgan, Alliance, O.

496,449 Perforated Pole Piece for Dynamo electric Machines. Charles E. Scribner and Ernest P. Warner, Chicago, Ill.

The dynamo is provided with consequent pole pieces, which are perforated across their centers or bored out eccentrically in such manner as to produce a field having the lines of force uniform as to strength and direction with respect to the coils of the armature. This construction enables the driving of the armature indiscriminately in either direction and the shifting of the brushes upon the commutator to vary the electromotive force of the machine to maintain the current strength uniform under a varying load. When consequent pole pieces have their faces concentric with the armature and without perforations at the center, the lines of force are unevenly distributed, and on account of this uneven distribution of the lines of force, with relation to the armature coils, it has been impracticable to run the armature in either direction.

496,455. Electric Lighting System. Elihu Thomson and Edwin W. Rice, jr., Lynn, Mass.

496,456. Commutator for Dynamo-electric Machines. Elihu Thomson, Swampscott, Mass.

496,474. Electric Bunch Light. Joseph Dillon, Larchmoot, N. Y.

496,500. Electrical Measuring Instrument. Edward Weston, Newark, N. J.

496,501. Shunt for Electrical Measuring Instruments. Edward Weston, Newark, N. J.

496,513. Vibratory Telegraphy. Stephen D. Field, Yonkers, N. Y.

Each station is connected by line wires with the secondary of a transformer located at the central office. The primaries of the transformers are connected together and with a thermal vibrator, which produces pulsations or undulations inappreciable to the ear. These inaudible pulsations supply the lines with current, so that when audible vibrations are produced upon the line by the transmitters the vibration is transmitted from the secondary of one transformer through the primaries to the secondary of the other.

496,514. Armature for Dynamo-electric Machines. Waldemar Fritsche, Berlin, Germany.

496,517. Manufacture of Electrodes for Primary or Secondary Batteries. Rudolph T. E. Hensel, Dresden, Germany.

The electrode is composed of a metallic salt or oxide having an electrolytic action and a medium or cement, comprising an acid, gelatine and an alkali; the mixture thereby acquiring the consistency of a plastic mass.

496,519. Thermo-mechanical Alarm. Philip Krumscheid, Boston, Mass.

496,522. Controlling and Equalizing Electric Motors. David Mason, Schenectady, N. Y.

496,533. Electric Distribution System for Railways. Nelson W. Perry, Cincinnati, O.

The system comprises a supply conductor and a supplemental conductor, the latter being composed of relatively insulated sections. The sections are connected with the supply conductor by connections normally open, and are adapted to be closed by an electro-magnetic device included between the section and the return conductor when the trolley shall have made connection with that section.

496,549. Printing Telegraph Instrument. Alexander H. Wirsching, Brooklyn, N. Y.

496,550. Electric Locomotive. Eben M. Boynton, Wes Newbury, Mass.

496,551. Mail Pouch Deliverer. Ernest W. Bradford, Indianapolis, Ind.

496,567. Utilizing Electric Motors for Operating Machinery. Carl Hoffmann and Ernest Richter, Berlin, Germany.

496,591. Apparatus for Making Blanks by Electricity. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass.

The strip of metal from which the blanks are to be cut passes between electrodes of an electric circuit in passing to the dies, being thereby subjected to a heating action sufficient to raise the metal to the proper temperature.

496,592. Working Brass by Electricity. George D. Burton, Boston, Mass.

Heretofore considerable difficulty has been experienced in working brass, due to its brittleness and liability to crack. The patented method consists in passing a current of electricity through the bar to be operated upon, thereby raising the temperature of the core to approximate fluidity, while at the same time maintaining the temperature of the exterior so far below that of the interior as to preserve its form and homogeneous character.

496,593. Electric Forge. George D. Burton, Boston, Mass.

496,594. Electric Forge. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass.

496,597. Electro-platiog Apparatus. Seth C. Catlin, Bloomfield, N. J.

496,602. Electric Signaling Apparatus. Stephen D. Field, Yonkers, N. Y.

496,611. Automatic Safety Switch. Adelbert E. Hutchios, Detroit, Mich.

496,618. Electric Gas Lighter. David J. Quinn, Brookline, and Paul W. Hoffmann, Boston, Mass.

496,631. Double Pole Trolley. Thomas E. Adams, Cleveland, O.

496,648. Magnet Armature. Fred L. Gregory, Chicago, Ill.

496,652. Insulator for Telegraph Wires. Ralph G. Hemingray, Covington, Ky., and James C. Gill, Muncie, Ind.

The insulator is of the ordinary kind used on telegraph poles, but is provided with a series of cleats or conical projectors at its lower edge, whereby water on the insulator will flow off in drops.

496,658. Galvanic Battery. Frank K. Irving, Brooklyn, N. Y.

496,659. Hot Box Detector. Robert C. Kerr and Peter Hardman, Fall River, Mass.

In a small chamber provided in the journal box is placed a thermo-stat adjusted to close an electric circuit when the temperature in the chamber reaches a pre-determined amount due to the heating of the bearing. The circuit thus closed rings a bell or other signaling device.

496,678. Voltmeter. Arakelyan H. Armen, Lynn, Mass.

496,688. Fare Register. Stephen C. Houghton, San Francisco, Cal.

496,690. Electric Alarm. Henry F. Kolbe, Detroit, Mich.

496,701. Electrode for Arc Lamps. John F. Sanders and Sarah J. Sanders, Portland, Ore.

The electrodes are adapted for lamps of the arc light type, in which the carbons rest in contact continuously during the burning of the lamp. The carbons are composed of a homogeneous mass of carbon, a light giving metallic salt, a reducing agent and a binder.

496,702. Electric Arc Lamp. John F. Sanders and Sarah J. Sanders, Portland, Ore.

The lamp is adapted to maintain the electrodes continuously in contact during the burning of the lamp, each electrode being acted upon by a spring, thereby causing the electrodes to feed toward one another. The tension of the springs may be varied to change the pressure with which the electrodes make contact, thereby varying the brilliancy of the light.

496,710 Friction Coupling for Dynamos or Motors. Elihu Thomson, Swampscott, Mass.

496,713. Wire Stretcher and Holder. Adolf Westmeyer, Pacific, Mo.

496,724. Burglar and Fire Alarm. William C. Dillman, Brooklyn, and George A. Seib, New York, N. Y.

496,728. Electric Meter. Joseph Edmondson and Joseph Oulton, Bradford, Eng.

496,743. Element for Galvanic Batteries. Auguste L. de Meriteus, Paris, France.

496,746. Correcting Electricity Meters. Joseph Oulton and Joseph Edmondson, Bradford, Eng.

496,775. Electric Forge. George D. Burton, Boston, and Edwin E. Angell, Somerville, Mass.

496,786. Electric Signaling Apparatus and System. Jacob W. Lattig, Easton, Pa.

496,787. Electric Signal Apparatus. Jacob W. Lattig Easton, Pa.

496,791. Armature Attachment. William D. Packard, Warren, O.

496,792. Attaching Device for Electric Light Fixtures. George Peeples, Philadelphia, Pa.

496,801. Electrical Testing Outfit for Cables, etc. Edward W. Stevenson, New York, N. Y.

496,807. Electric Cut-out. Augustus Wright, Providence, R. I.

496,808. Electric Switch. Augustus Wright, Providence, R. I.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

THE KESTER Automatic Lightning Arrester

Will take care of any number of discharges of lightning per minute. They will prevent damage from lightning on any circuit not using the ground for return. They are intended only for station use and for the protection of generators and motors. They have no equal. They automatically rupture the arc formed by the lightning, and never short-circuit, thereby grounding the line. Price, $15.00 per set of two, and any one purchasing a set will be allowed to return them and have their money refunded provided they do not absolutely protect all circuits to which they are attached.

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin.

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 6¼ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $21,193.56, with interest from the 22d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,
Receiver of the Milwaukee Electric Railway Company.

HOLMES, BOOTH & HAYDENS,

Factories: Waterbury, Conn. 25 Park Place, New York.

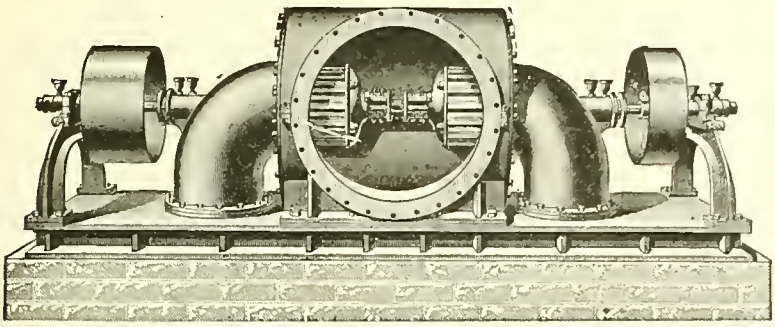
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

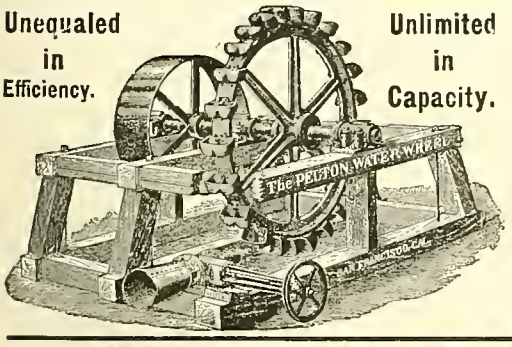
The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

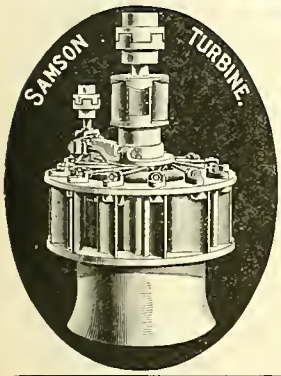
ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.,
121-123 Main St., San Francisco, Cal., U. S. A.
143 LIBERTY STREET, - - NEW YORK.

☞ It having come to our notice that our patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted.

PELTON WATER MOTORS. Varying from the fraction of 1 to 15 and 20 horse power, unequaled for all light running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ Send for Motor Circular. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates



JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

THE JAMES LEFFEL & CO. SPRINGFIELD, OHIO, AND NEW YORK CITY.

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

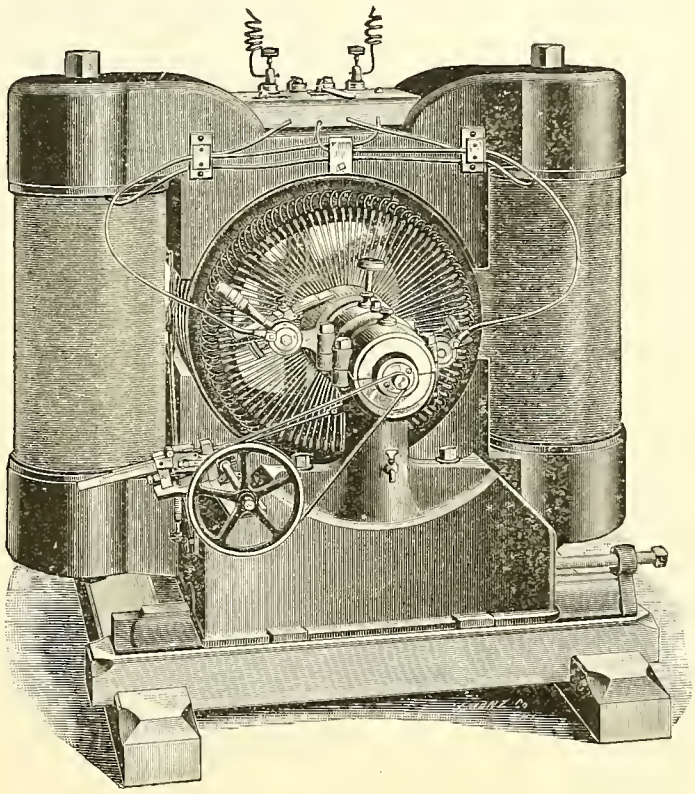
BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

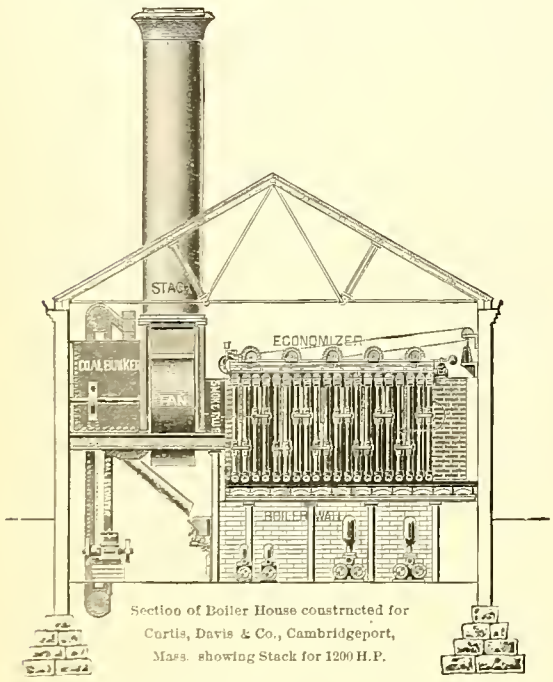
WANTED:—One good construction firm in each city to represent us.

Apply to
ALBERT SECHRIST,
Manufacturer and Patentee, DENVER, COLO.



Section of Boiler House constructed for Curtis, Davis & Co., Cambridgeport, Mass. showing Stack for 1200 H.P.

BEING A MANUFACTURER you are forced by competition to keep in touch with all genuine economies as soon as their value is proved; hence your Compound Engines, Condensers, Steam Loops, etc., to reduce **the cost of using your Steam.** It is equally important that you should consider every item which enters into **the cost of making your Steam.**

If you are building a new Boiler House, resetting your old boilers or adding new ones:
If your present boilers are short of capacity:
If you wish to raise their evaporative duty to the level of expert hand firing, **and keep it there all the time:**
If you wish smokelessness by **preventing,**—not **concealing** or **consuming** the smoke:
If you wish to preserve your boilers from unequal strains.

YOU WILL CAREFULLY CONSIDER MECHANICAL STOKING.

If you wish to save the whole cost of handling, which in large plants is the greater part of the labor item:
You will equip with simple, cheap and practical

Coal and Ash Handling Machinery.

If you wish to have your fires always under control, irrespective of atmospheric conditions, quality of fuel, or length of run:
If you wish to be independent of extraordinary or sudden demands for steam:
If you wish to save a large portion of the cost of a chimney with its foundations—**and above all,**
If you wish to return into your feed water the greater portion of the heat otherwise sent up the flue to make draft,

You Will Use Mechanical Exhaust Draft and Economizers.

It is a well organized Department of our Business to design and construct Boiler Plants, comprising any or all of the above features, as good judgment may determine. We assume an authority in this branch of Engineering arising from an experience with over 750,000 Horse Power of Boilers equipped with Stokers.

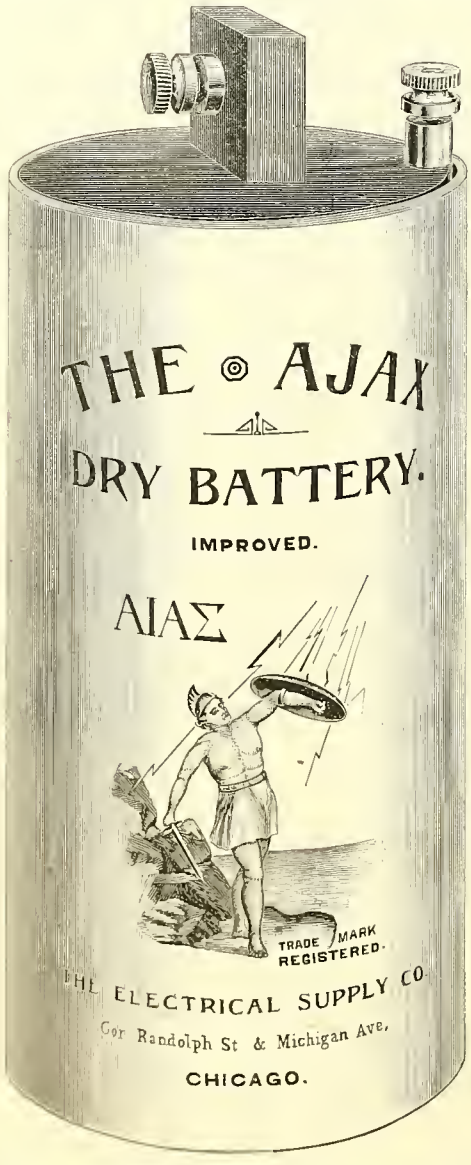
THE AJAX DRY BATTERY

Opened the World's Columbian Exposition, May 1, 1893.

PRESIDENT CLEVELAND

"Pushed the Button, and the Ajax Battery did the Rest."



The above Battery was 30 inches high by 12 inches in diameter, and was manufactured expressly for this purpose. Its E. M. F. was about 6 volts with a current of 7 amperes. It is now on exhibition in the pavilion of The Ansonia Electric Co., north end of gallery, Electricity Building, Jackson Park.

The regular Batteries carried in stock measure 6 inches high, 2¾ inches in diameter and weigh about 2½ pounds; E. M. F., $1\frac{4}{10}$ volts; Internal Resistance, $\frac{3}{10}$ of an ohm; Current, 5 amperes. This Battery is manufactured and for sale exclusively by

LONG DISTANCE TRANSMISSION OF POWER,

Street Railway Generators, Motors and Appliances.

Our alternating current incandescent apparatus is in use in 430 central stations. 1,000 isolated plants. Our arc apparatus is in use all over the world.

We are now transmitting light and power various distances up to 28 miles from the source.

Our multipolar railway generators and noiseless single reduction motors have worked a revolution in the electric railway field in two years.

Orders for APPARATUS, REPAIRS and SUPPLIES formerly furnished by the United States Electric Lighting Co., Newark, N. J., should now be sent to this Company, where they will receive prompt attention.

BRANCH OFFICES IN ALL THE LEADING CITIES.
AGENTS FOR CANADA: AHERN & SOPER, OTTAWA, ONT.

"NOVAK"

We take pleasure in informing the public that after many months of experimenting we have succeeded in producing an incandescent electric lamp superior to any of the numerous lamps hitherto offered to the public. The importance of the discovery may be realized when we inform you that the lamp now manufactured by us is a total departure in principle from all other incandescent lamps. Our lamp will maintain its initial candle power at its initial efficiency throughout the usual average life of incandescent lamps.

The importance of this improvement can only be realized by those who have had the usual experience with lamps which begin to decrease in candle power, and at the same time increase their consumption of energy as soon as put into service.

THE "NOVAK" LAMP MAINTAINS ITS FULL CANDLE POWER AT THE SAME EFFICIENCY THROUGHOUT ITS LIFE.

The "Novak" lamp is fully protected by patents of our own, and is free from any possible claims of infringement of other patents.

The efficiency and average life of the "Novak" lamp are fully equal to those of any other lamp ever offered.

The filament used in the "Novak" lamp is the celebrated "Perkins" filament the superior quality of which is too well known to need comment by us.

We respectfully solicit correspondence in regard to the "Novak" lamp, feeling sure that a lamp possessing the superior qualities of this lamp, and manufactured by a company whose business it is to supply the general public without discrimination, will be appreciated.

GENERATORS. CHICAGO, ILL. MOTORS.

MOTORS AND DYNAMOS with

Forged Iron Field Magnets.

COMMERCIAL ELECTRIC CO., 116 S. Tennessee Street, INDIANAPOLIS, IND.

WILLARD L. CANDEE, H. DURANT CHEEVER, } Business Managers. GEO. T. MANSON, Gen'l Supt.

THE OKONITE COMPANY LIMITED

13 Park Row, New York.

OKONITE TRADE MARK

INSULATED

WIRES AND CABLES,

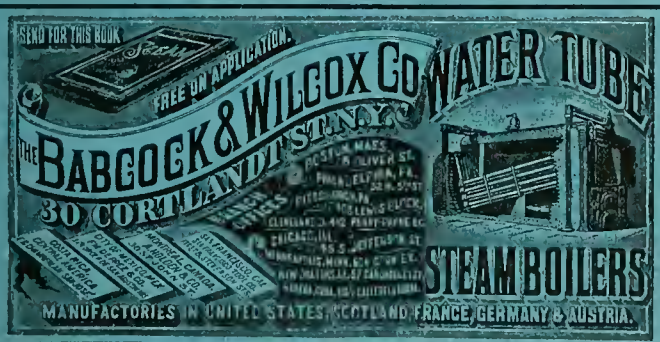
For Aerial, Submarine and Underground Use.

Candee Aerial Wires.

Manson Protecting Tape.

Okonite Waterproof Tape.

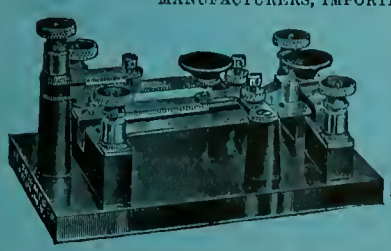
BRANCHES: Chicago, Boston, Philadelphia, Minneapolis, Cincinnati, Kansas City, Omaha, Louisville, St. Louis, San Francisco, London and So. America.



THE E. S. GREELEY & CO.,

5 and 7 DEY STREET, NEW YORK,

MANUFACTURERS, IMPORTERS AND DEALERS IN



KEY FOR CAPACITY TESTS.

Electrical Supplies

OF ALL DESCRIPTIONS.

Telegraph, Telephone, Electric Light and Power Appliances. Construction Tools and Line Material.

WE OWN AND OPERATE THE

Greeley Electrical Laboratory,

WHERE WE MANUFACTURE A FULL LINE OF

Test Instruments and all Scientific Measurement Apparatus.

PACKARD HIGH GRADE INCANDESCENT LAMPS.

Manufactured by the

NEW YORK & OHIO COMPANY, Warren, Ohio.

AGENTS:

New York City, Chas. E. Chapin, 136 Liberty St.
Chicago, Ill., Elec Appliance Co., 242 Madison St.
St. Paul, Minn., The Elec. Engineering & Supply Co.
St. Louis, Mo., St Louis Electrical Supply Co.
San Francisco, Cal, A. C. Brainard & Son, No. 109 California St.
Cincinnati, O., Post-Glover Elec. Co., 215 W. 4th St.
Pittsburgh, Pa., Duquesne Electric Supply & Construction Co
Montreal, Can., Packard Lamp Co., 96-100 King St.
Washington, Northwest Fixture & Elec. Co., Seattle.

ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES,

200 and 202 North Third Street, - - PHILADELPHIA, PA.

LOUIS K. COMSTOCK,

Electrical Engineer and Contractor.

TESTS, PLANS, SPECIFICATIONS AND SUPERVISION

For all Kinds of Electrical Installations.

ELECTRIC CONSTRUCTION.

1419 Monadnock Building, Chicago.

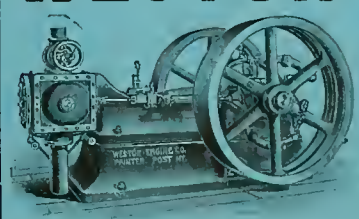
Massachusetts Electrical Engineering Company,

STONE & WEBSTER, Managers.

ELECTRICAL ENGINEERS,

BOSTON, 4 Post Office Square. CHICAGO, Title and Trust Building.

WESTON ENGINES.



HIGH PRESSURE BOILERS.

COMPLETE POWER PLANTS.

ESTIMATES AND DRAWINGS SUBMITTED.

WESTON ENGINE CO.,

Painted Post, N. Y.

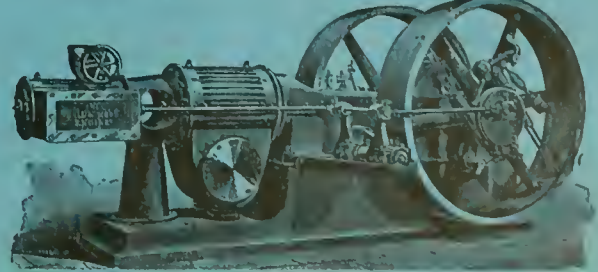
REPRESENTATIVES:

Julian Scholl & Co., 126 Liberty St., New York.
Geo. D. Hoffman, 82 Lake St., Chicago, Ill.
H. M. Sclple & Co., 34 & Arch Sts., Philadelphia.

Jewell Belting Co., JEWELL BELTING Hartford, Conn.

THE BALL & WOOD COMPANY,

Builders of Improved Automatic Cut-off Engines.



AGENTS:

W. B. Pearson & Co., Home Ins. Bldg., Chicago, Ill.
W. A. Day, 128 Oliver St., Boston, Mass.
E. H. Whiting, Jacobson Block, Denver, Colo.
James & Co., Chattanooga, Tenn.
William M. Porter, Detroit, Mich.
T. W. Anderson, Houston, Tex.

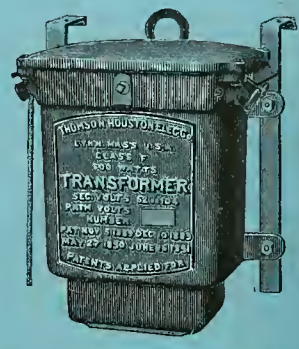
TRANSFORMERS

PERFECT SAFETY.

HIGHEST EFFICIENCY.

GOOD REGULATION.

30,000 WATT TRANSFORMER.



SMALL CORE LOSS.

CONVENIENCE IN INSTALLATION.

OIL INSULATION.

Best Possible Mechanical Insulation, with Additional Insulation of Oil. Core Ground Wire. Primary and Secondary Coils are Fully Subdivided. No Fuses in the Transformer Case.

TRANSMISSION OF POWER BY ELECTRICITY OVER LONG DISTANCES

Is rendered practicable by means of our "Step Up" and "Step Down" Transformers, the Insulation in which is Tested to Withstand a Pressure of 10,000 Volts Alternating.

CARPENTER ENAMEL RHEOSTATS.

TWO-PHASE GENERATORS

Of our Standard Alternating Current Sizes, for use with

Stanley-Kelly Two Phase Motors.

For Prices and Information Address nearest District Office.

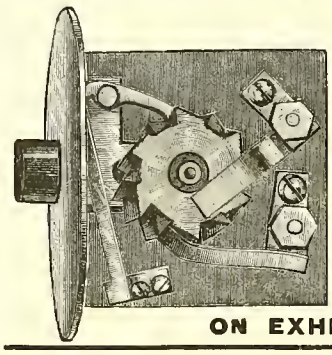
Manufacturers and Owners of Woltman & Triggs'



"STANDARD"
Single Push Button Flush
SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this switch single pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

ON EXHIBITION AT WORLD'S FAIR.

Central Station and Isolated Plant Astatic Ammeter (One-half Size.)

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters. (See Illustration.)

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

Vol. XII. CHICAGO, MAY 20, 1893. No. 20

Electricity at the World's Fair.

A row of boilers over 600 feet long, with a combined capacity of about 20,000 horse power, is a sight not often met with, and it is doubtful if a counterpart of the steam producing plant of the World's Fair, a perspective view of which is given on this page, is in existence. Certainly there is no plant of equal size in which oil is burned exclusively for fuel, and this fact alone makes the boiler house of the exposition one of the greatest attractions on the grounds to the mechanical engineer. The system of piping employed and the oil burners, which have heretofore been described in this journal, are also of exceptional interest. The use of oil enables the attendants to keep the plant in an ideal state of neatness, although up to the present time the space in front of the boilers has been considerably littered by material necessary for construction operations. The plant is especially designed with the view of being accessible to visitors. The floor is nine feet lower than that of machinery hall, of which the boiler house is an adjunct, and a gallery for spectators, twenty feet wide, extends the whole length of the room, 627 feet, on the same level as the floor of the main building. This gallery is supported by brick walls rising above the boiler room floor, and the half nearest the wall of machinery hall contains the feed water heaters, while underneath the heaters, on the ground floor, are placed the feed pumps that supply the boilers from the feed water heaters, through an overhead system of piping. The steam passes from the boilers at a pressure of 125 pounds through overhead pipes into a main header 800 feet long and 36 inches in diameter, the sections of which are connected by 10 inch steam equalizing loops arranged to take up the expansion. From the top of this main header the steam passes through pipes laid beneath the aisles of machinery hall to the engines in the respective blocks. The boilers comprising the plant are exhibits as well as a portion of the power installation, and they were furnished to the Exposition company without charge. All are of the water tube type, and the manufacturers represented are Abendroth & Root, Gill, Heine, the National company, Campbell & Zell, Babcock & Wilcox and the Stirling company. Practically the plant is a portion of the great electrical central station at the fair, as of the 20,000 horse power capacity 17,000 is for engines that drive dynamos. Central station men will therefore find it of advantage to make a thorough inspection of the boiler house. The electrical signaling and controling mechanism for the oil fuel plant is also of interest.

Especial efforts were made last week to complete the arc lighting of the pier, in view of Saturday evening's illumination. All the patrol lights about the grounds are now burning every night except those intended for the extreme southern portion of the park, which will not be needed for some time to come. All the corona lamps in the manufacturers building are now ready, and all the other buildings are wired for arc lights except the anthropological building. Arc lamps have furnished light in all the main buildings except transportation and horticulture.

The backward condition of the exhibits in electricity building is a disappointment even to the most optimistic friends of the department, who are disposed to make every excuse for shortcomings. Until April 1st, as noted in the

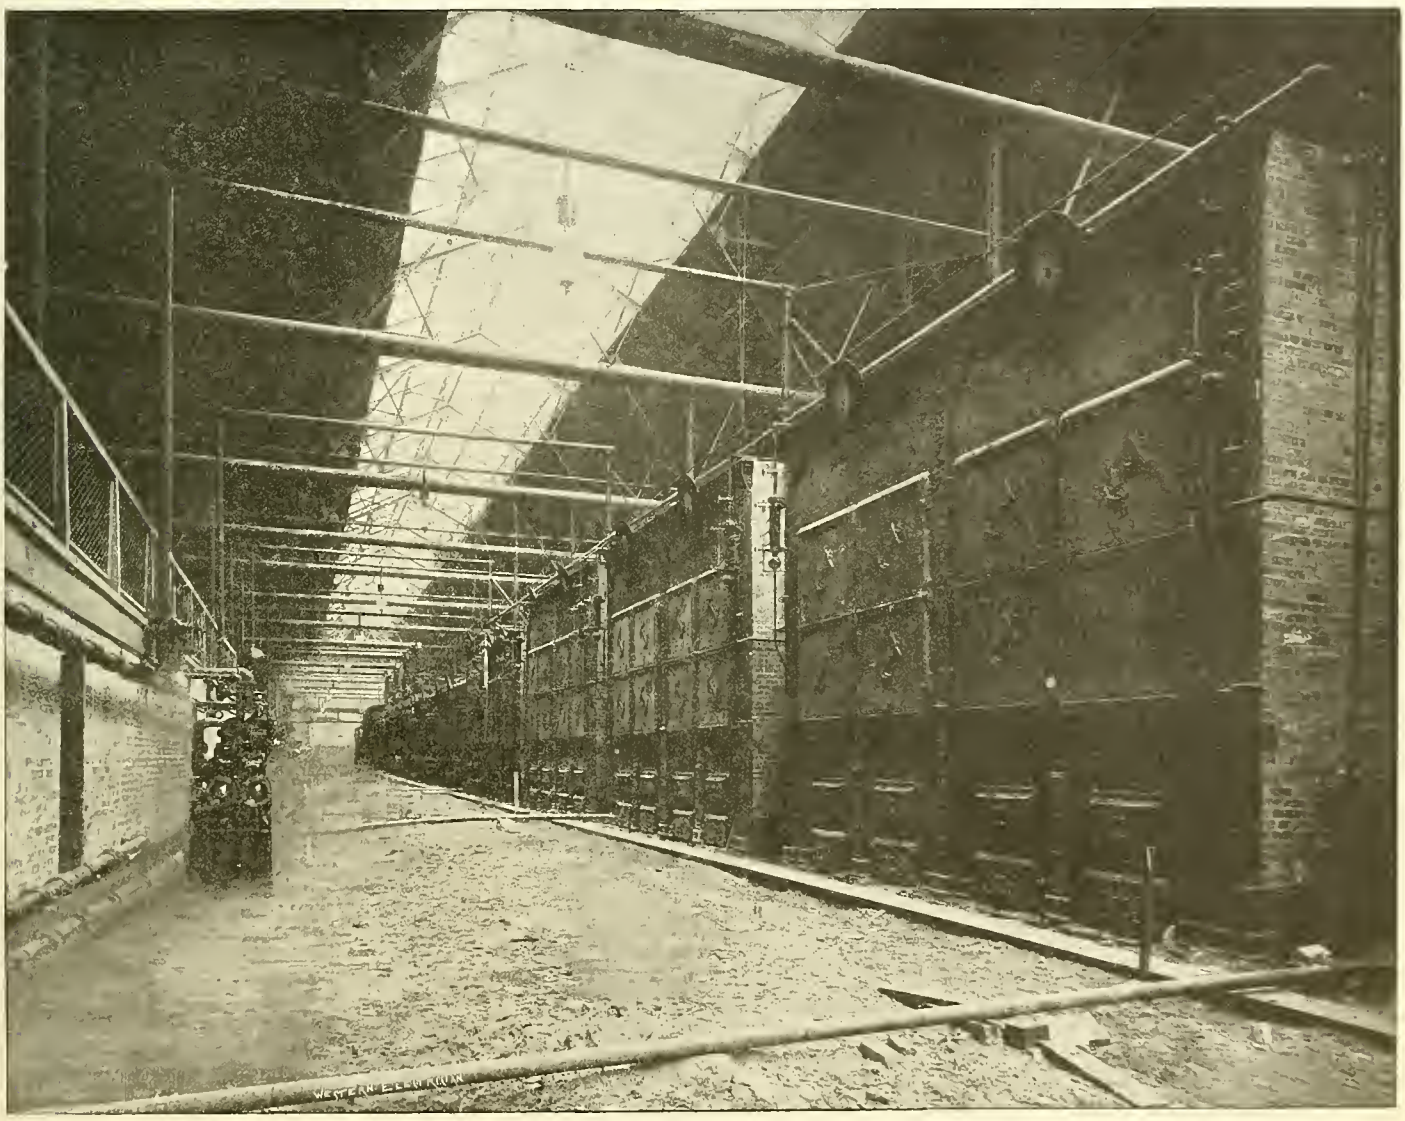

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—BOILER PLANT, MACHINERY HALL.

WESTERN ELECTRICIAN at the time, the prospect of a prompt completion of the display in electricity building was most cheering. The building was early cleared up; little complaint was made of roof leaks, which have caused so much trouble in other buildings, and everybody seemed eager and enthusiastic. But since then the work of installating exhibits has dragged, and the uncompleted appearance of the main floor and galleries has changed for the better with painful slowness. Finally Chief Barrett's patience became exhausted, and on May 9th he issued the following special notice to exhibitors:

Exhibitors in this department are unnecessarily behind in the completion of their exhibits, The department has taken every possible precaution to aid them, and wherever

possible has taken upon itself unusual responsibilities and labor to this end. The department has provided all-night lighting in the building, hoping that exhibitors would take advantage of the fact to work overtime and with double shifts of men. This has not been done, and the department declines to suffer further criticism from the management of the exposition and from the public on account of the dereliction on the part of the exhibitors. The director-general has fixed May 13th as the date by which all installation work must cease. It is therefore determined by this department to fix May 14th as the extreme limit of time for receiving and completing the installation of exhibits. All exhibits not absolutely complete on that date will remain during the period of the exposition in an unfinished state.

The effect of this order was immediately noticeable in the increased activity shown by exhibitors, but at the close of last week a survey of the building showed that it would be impracticable to enforce the literal provisions of the notice without entailing disgrace on the entire electrical fraternity. A tacit understanding was therefore arrived at by which the time was extended one week. The present indications are that the electrical display, as a whole, will be complete and ready for inspection on May 22d. As for the responsibility for the present conditions of affairs there are, of course, differing opinions. The exhibitors, with some notable exceptions, come in for severe criticism for the delay, but they, in turn, assert that the authorities of the exposition were largely at fault in not furnishing proper transportation facilities by which goods on arriving at the grounds could be taken to the place assigned. This applies to teaming trucks as well as freight cars, and it is said that the supply of broad-tired wagons, the only type allowed on the grounds, save in exceptional instances, was entirely inadequate. This was the fault of the construction department, however, and could not be ascribed to the department of electricity. There were also many changes at the last moment, not a little indecision and much waiting to see what the other fellow would do—in short the course of action often summed up under the comprehensive term, "monkeying." But this stage is now passed, apparently, and all are hard at work. It is hoped that a week will see the electricity building in the pre-eminent place it is entitled to as an attraction.

Just west of the "tower of light," on the ground floor of the electricity building, the General Electric company is installing an interesting scheme of power transmission. A 100 horse power, 500 volt, Thomson-Houston, continuous current motor is directly connected to a large Blake triplex pump with a capacity of raising 450 gallons of water a minute to a height of 650 feet. This electrically operated pump will take water from a 1,500 gallon tank and force it through an overhead pipe to a Pelton water wheel, from which the water will fall into a second tank and flow back into the first by gravity, thus being used continuously. The Pelton wheel will drive a three-phase generator, to which it is directly coupled. This generator in turn will supply current for operating a number of multiphase motors, one of which will drive a hoist. A portion of the current will also be utilized for incandescent lighting. All the operations of this unique electrical and water power combination will be performed in full view of the spectators, who will thus be given a new revelation of the multiform applications of electricity. The big pump is a handsome piece of work and is powerful enough, if its full capacity were utilized, to send a stream of water through the roof of the building 100 feet above it. The installation work is in charge of R. Hofstede-Crull, a Dutch electrical engineer, who had charge of the Thomson-Houston International company's exhibit at the Frankfort exhibition.

In the line of exhibits that are "the biggest in the world" Germany may be credited with two—the 120 ton Krupp gun and the five-foot Schuckert search-light. The latter, which is of more immediate interest to the electrical fraternity, is now mounted on the northwestern corner of the promenade about the roof of the manufactures building, which is reached by four elevators in the northern part of the building. There seems to be no doubt that this is the largest projector yet constructed, and Mr. Tischendoerfer, the World's Fair representative of Schuckert & Co., challenges comparison with any search-light in the world operated under like conditions. The lamp itself is five feet in diameter, and it is claimed that the illuminating strength of the arc is 57,000 candle power, which is increased to 194,000,000 candle power on the surface of the parabolic mirror. This mirror is seven-eighths of an inch thick, and six months was consumed in the labor of grinding and polishing it. After the mirror was completed, great care was necessary, of course, in packing it for shipment to Chicago. A padded receptacle was made, and this was enclosed in a strong wooden framework. The mirror was attached in this cage by four chains at the corners, and jarring was prevented by lateral springs fastened to the sides of the framework. In this manner the fragile mirror was safely transported by land and sea to its final resting place on the manufactures building at Jackson Park. The illustration, Fig 2, represents the parts of the projector, as they stood on the floor of electricity building before the final location was decided. The mirror is shown in its temporary frame in the center, and an idea of its size may be gained by comparison with the figure of the workman standing beside it. The drum of the lamp is on the left and the standard on which it is hung on the right. The operation of the lamp is similar to that of the four-foot projector shown on the transportation building at the World's Fair dedication last October, and described in the WESTERN ELECTRICIAN at that time. It takes 150 amperes of current with a potential difference of 60 volts at the lamp terminals, or about 12 electrical horse power. The positive carbon is 1½ inches in diameter and the negative carbon 1 inch.

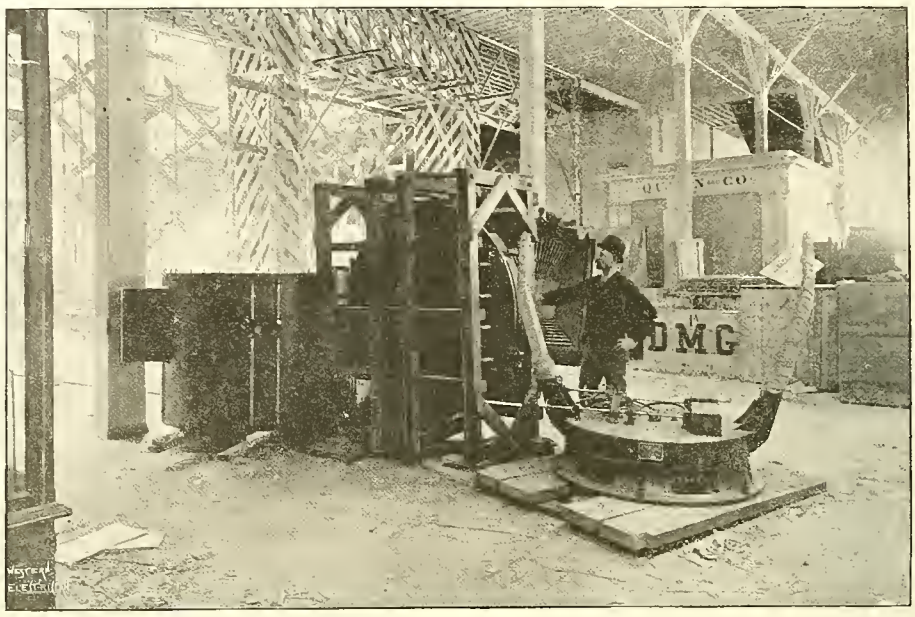

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.—THE LARGEST SEARCH LIGHT IN THE WORLD ON THE FLOOR OF ELECTRICITY BUILDING, READY FOR MOUNTING.

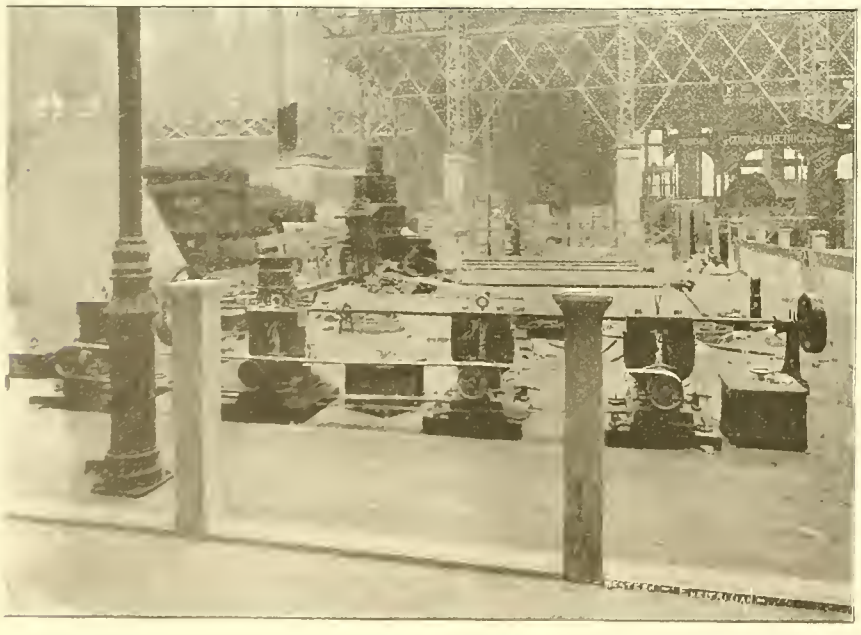

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.—INGENIOUS ARRANGEMENT OF MOTORS AND DYNAMOS FOR TELEGRAPHIC PURPOSES.

An interesting "wrinkle" is that illustrated in Fig. 3, which shows the method adopted for supplying current for the Western Union quadruplex system. The principal office of the telegraph company is in the administration building, but as Mr. Edison invented the quadruplex instrument the current generating apparatus is shown in the space devoted to his personal exhibit in electricity building. Here only 500 volt circuits were available for power, and two 250 volt Edison dynamos were connected in series with this circuit and operated as motors, belted together so that they would run in synchronism. To these motors two other 250 volt machines were belted in tandem and run as generators. The fields of these dynamos were weakened by rheostats sufficiently to produce a current of a pressure of 300 volts, which was distributed to the Western Union circuits on the three-wire system. This ingenious arrangement produced the curious disposition of belts shown in the picture. It was a temporary expedient, pending the arrival of a larger motor and the erection of a line of shafting, but it answered the purpose satisfactorily.

The Electric Launch & Navigation company now has twenty electric boats in operation on the lagoons of the World's Fair, and they are enjoying a good patronage. There is also another boat in service for the use of exposition officials. Nearly one hundred men are now employed by the company under the direction of Gen. C. H. Barney, the superintendent. Fifty boats will be running at the height of the season, and the prospect for a great rush of business is excellent, as no electrical feature of the fair has given more general satisfaction than the launch service. Each boat has a pilot and guard, and turnstiles and ticket boxes are being erected at the landings, so that each passenger will pay his fare before getting on the boat. Each boat is provided with a whistle operated by compressed air. The regular speed is six miles an hour, but the special boats provided for officers of the exposition can be run at the rate of 10½ miles an hour. All the boats are graceful in appearance, but the special launches are particularly handsome. Thus the director-general's is planked with mahogany instead of cedar, and has an

orange-colored awning instead of the familiar stripes. Chief Burnham's launch has a white awning and the two boats of the council of administration have striped awnings, but with the colors reversed, as compared with the ordinary boats. The boats are not named but numbered.

After some delays in installation the three electric traveling cranes in machinery hall were placed in operation and have proved of great assistance in placing the heavy machinery. Photographs of two of them—the Yale & Towne and Morgan—are reproduced in Figs. 4 and 5. The former picture also gives an excellent idea of the manner in which the machinery is massed in the building. United States motors are used on the former crane and Thomson-Houston on the latter. The third crane was furnished by William Sellers of Philadelphia and was the last to be put in position. It is the intention to fit up the cranes for the transportation of passengers after all the exhibits have been installed.

FIG. 5. ELECTRICITY AT THE WORLD'S FAIR —ELECTRIC TRAVELING CRANE, MACHINERY HALL.

On two evenings last week—Monday and Saturday—the park was open to visitors, and the electrical illumination of the grounds and buildings was made the feature of both occasions. On Saturday evening the arc and incandescent lighting was the most elaborate yet attempted, and a large throng of spectators, estimated at 50,000, was drawn out to witness it. The scene about the central "court of honor," where the greater part of the visitors congregated, was very beautiful and impressive. The administration building, completely outlined by rows of incandescent lamps, with the interior brilliantly illuminated, was the central feature, and it excited unbounded admiration. The manufactures, electricity, mines, agriculture and machinery buildings were all brightly lighted by arc lamps and were open to the public. The horticultural and fisheries buildings were partially lighted, while hundreds of arc lamps about the grounds added to the general effect. The brilliance of the central court was greatly increased by the thousands of incandescent lamps placed about the basin and on the bridges, just above the water, the reflection in the latter element adding much to the effect. The electric fountains were in operation but were not electrically illuminated. A search-light on the southwestern corner of the manufactures building threw a white beam of light in various directions, but most frequently on the dome of the administration building. The cornice line of the peristyle and music hall was also prettily lighted by incandescent lamps. In all, about 10,000 incandescent lamps were burning on the grounds, about 8,000 of these being carried on one of the big Westinghouse alternators belted to the Allis engine, and the remainder on a 4,000 light alternator. About 1,000 arc lamps were burning. The lighting of the northern part of the grounds was insufficient, but the visitors, enlivened by the music of three bands, seemed, on the whole, to be well pleased.

The first of the large electric manufacturing companies to complete its exhibit in electricity building is the Western Electric company of Chicago, which was one of the first to begin work. This company has an exceedingly attractive display, which is divided into two portions, one of which is located in machinery hall and the other in electricity building. The former consists of twelve 50 light arc machines and two 200 horse power 220 volt generators. Ten of the arc machines are used in lighting the grounds and a portion of the buildings. The other two arc machines are used in lighting the exhibit in electricity building. The arc machines are of the latest type, an especial feature of which is the carbon brushes, which require no lubrication on the commutator. They are to be operated by Watertown, Erie and New York Safety engines.

The generators are used for transmitting current for lighting the exhibit in electricity building. They are of the multipolar type, and the armatures are Gramme wound. The brush holders of these machines are so constructed as to render the running of the machines almost noiseless, and the method used for tightening and slackening the belts is worthy of attention. The dynamo rests upon rollers which revolve on an iron sub-base, thus reducing to a minimum the friction when the machine is being moved backward and forward. These machines are driven by belts supplied by the Graton & Knight Manufacturing company, Worcester, Mass., power being furnished by two 200 horse power and one 100 horse power Russell engines manufactured by Russell & Co., Massillon, O.

The switchboard in this space combines both the arc and incandescent circuits, and is made of brown Tennessee polished marble, the back being as elegant in its fittings as the front side of the board. In connection with the arc system the board is equipped with a system of ground alarm which notifies the attendant by the dropping of a shutter whenever a ground is made on any of the circuits. Provision is also made by which the insulation with respect to ground of arc circuits can be measured at any time while the machines are doing duty. All of the wiring from machinery hall to electricity building is carried through the subway, the wire being fastened to the glass insulators by means of specially made clips, no tie wire being used. This clip is intended to prevent an abrasion of the insulation. In the electricity building the circuits run into a switchboard of brown Tennessee marble equally as attractive as that in machinery hall. This board is also polished on both sides, and an examination of the back of the board will show the care with which the problem of distribution of the circuits has been wrought out.

Undoubtedly the most interesting features of the exhibit in electricity building in the way of decorative lighting consist of an Egyptian temple, a column of light with streamers representing lightning and large revolving balls of light fixed at the ends of the streamers, and an electric theater in which the scenic effects produced by electric lights will be shown. All are in the southeastern corner of the building, on the main floor.

The Egyptian temple is designed to represent the old Egyptian architecture, and is decorated upon the outside by Egyptian figures, representing the performance of the operations seen in the Western Electric factories, the workmen, in old Egyptian costume, being shown at work on the appliances which are displayed in the showcases placed in the interior of the temple. The interior of the building is a scene of beauty, and is divided into two rooms. Around the sides and corners of the rooms are placed glass pillars with Egyptian caps, all made of stained glass lighted from behind, while the ceiling in the small room is made of beautifully stained glass. Another novel feature of the illumination is the passageway of the small room, in which are placed over 400 16 candle power lamps. The light on these ceilings is constantly changing, which is done by means of an automatic revolving switch placed outside the building. Over the passageway of the temple are placed winged discs formed out of cut glass and illuminated behind by means of arc and incandescent lights. The total number of incandescent lamps used in the entire building is over 1,200. The decorative stained glass work was designed and executed by Healy & Millet of Chicago. For the comfort of visitors a 60 inch duplex fan under the floor keeps a current of fresh air circulating through the building.

Passing through the temple, the first thing to meet one's attention is the column of light, which consists of over 3 000 incandescent lamps wound spirally around the column and radiating upon streamers representing lightning, and ending in large balls, which are suspended thirty feet from the floor. The light apparently comes out of the floor, and, after rushing to the top of the column, flashes out on the lightning streamers and illumines the balls, which are revolving at a high rate of speed. These balls change color from red to white and then to blue, after which the light goes out and again appears at the base of the column. This effect is automatically produced by means of a large rotating switch concealed from view. The current used in this decoration is all 110 volt, whereas that used in the temple is 220 volt. The current is reduced from 220 to 110 by means of a motor generator consisting of two machines mounted on the same base and coupled shaft to shaft. This machine

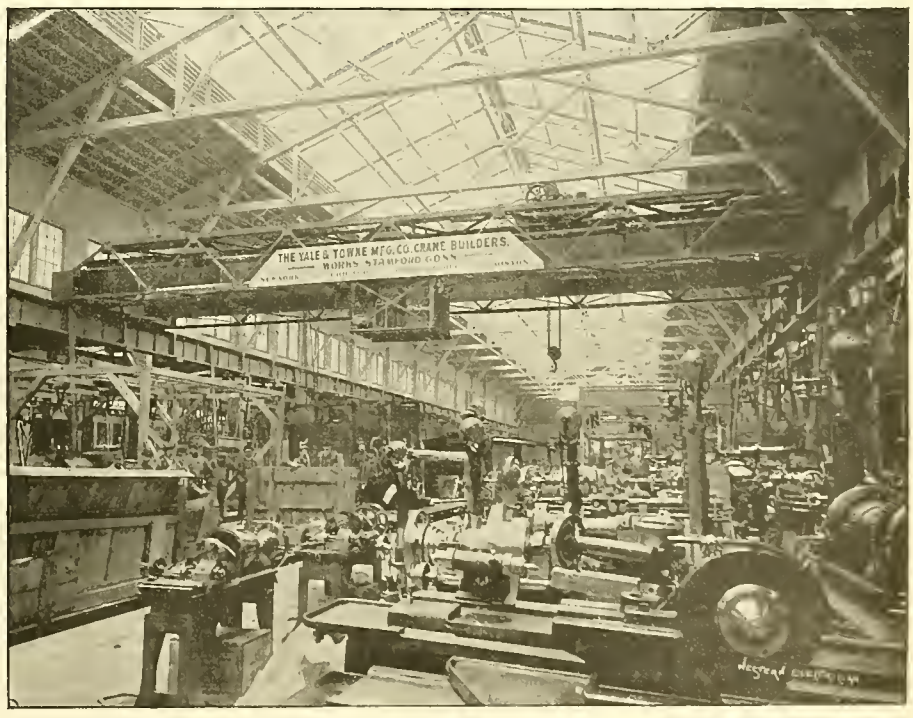

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC TRAVELING CRANE, MACHINERY HALL.

is located near the switchboard, and is of the slow speed type. Upon the switchboard is a device by means of which it is impossible to start the machine without first closing the rheostat on the armature circuit, thus preventing damage to the motor armature.

In the foreground of the model theater will be seen a beautiful electric fountain produced by incandescent lamps, while beyond is a mountain scene with streams of running water. The light effects in this scenery show to what extent the electrician's genius, combined with the artist's skill, can reproduce nature with all its beauty and realism. Near this theater is a writing machine, which spells out the letters "W. E. Co." A finger traces each letter, and while doing so, and at the same time, lights the lamps which produce the letters.

The exhibit also contains nearly every other form of appliance used in the field of electricity, and which is made at the factories of the Western Electric company. There are to be seen annunciators of all kinds, call bells, push keys, telegraph and telephone apparatus and telephone switchboards; also manholes, in which will be shown the system of underground cables made by this company, and all apparatus and appliances for putting these cables in position. Near one corner of the building is shown some of the dynamos and lamps manufactured by the Western Electric company.

One interesting department is devoted to historial displays, in which will be seen a street car engine and dynamo, which has been reproduced from descriptions given by the inventor, Moses G. Farmer. This machine is supposed to be the first reversible motor ever produced, and was made and operated in 1847. Some of the wheels and one of the seats in this exhibit are the ones used in the original. Near by are two incandescent lamps which were made by Mr. Farmer in 1859, and which are mounted upon an old mantelpiece, used by the inventor for holding the lamps in his old home in Salem, Mass. One of his early dynamos is also shown in this exhibit.

Another attractive feature is the working exhibit, in which are shown in operation some of the machines which have been invented by the Western Electric company, and

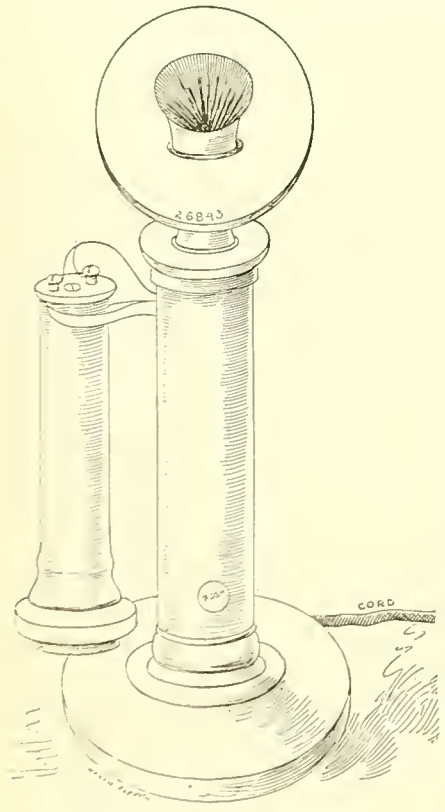

FIG. 1. MODERN EQUIPMENT OF TELEPHONE STATIONS.—EXTENSION DESK STANDARD.

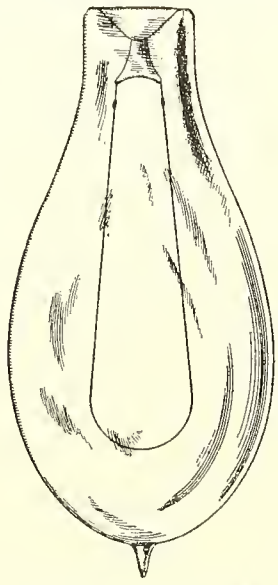
which are in daily use in its factories. Here will be seen an automatic nut machine which forms a complete nut out of a roll of copper; also a screw machine which automatically performs on both ends of a single piece, and thereby saves a large amount of labor in handling. A multiple drill press is also shown, which drills a large number of holes at once. This machine is novel in that it is adjustable and permits all the holes being located anywhere within the radius of its table. Upward of thirty holes can be drilled at once with any size drill in any kind of metal and anywhere upon this table.

The main passageway separating the two spaces occupied by the company's exhibit is spanned by a large electrically illuminated sign. The sign is constructed of plate glass held by an iron framework, the words "Western Electric company, Chicago, New York, Antwerp, London, Berlin, Paris," being formed of colored glass. The sign is alike on both sides and inside is a rack of 14 2,000 candle power arc lamps, which is kept swinging back and forth across the glass letters by means of a small electric motor.

The Western Electric company also furnishes the lighting of the American Bell Telephone company's building, and



WARING INCANDESCENT LAMP.

has built and equipped the multiple switchboard in that building, which is the regular operating board for the World's Fair exchange. The trunk lines connecting this board with the main city office, about eight miles away, are in aerial and underground cables made by the Western Electric company. These cables are also used for the long distance service between the fair grounds and New York, Boston and other cities.

In making this exhibit it has been the intention to show something of the decorative effects produced by electric lighting, as well as the varied products of the company's manufacture.

Waring Incandescent Lamp.

During the last few months there seems to have been a general departure from the line of investigation heretofore pursued by lamp makers, and as a result many incandescent lamps have been introduced to the public which do not belong to the class known as vacuum lamps. The latest of these is the Waring lamp illustrated herewith. The inventor, John Waring, claims that it has been generally accepted by those familiar with the art that if the carbon of an incandescent lamp is not placed in a vacuum, even though it is surrounded by a gas which does not chemically attack the carbon, the "air washing," or rapid passage of the molecules of gas over the highly heated surface of the carbon, will produce a disintegration of the carbon. It has also been well known that if an incandescent carbon is surrounded by an atmosphere of hydrogen or nitrogen, the rapidly moving molecules of gas will carry off the heat from the carbon and thus require the expenditure of much more energy to keep the carbon in the desired state of incandescence. Accordingly it has been supposed that it was necessary to place the carbon in a nearly perfect vacuum, that is, in a sealed chamber having an interior gas pressure of only about one-millionth of an atmosphere.

Mr. Waring claims to have discovered that if a carbon in a sealed chamber is surrounded by a gas of great specific density, the dissipation of energy by loss of heat from the carbon is reduced, so that as a factor it may be ignored. By using as a surrounding medium a gas which has no injurious chemical effect on the carbon, the disintegration caused by high temperature is probably lessened and the blackening of the glass of the lamp is materially lessened, while the stability of the carbon is proportionately increased. As a result, it is claimed, a lamp is produced which will maintain its efficiency much longer than a lamp having its carbon in a vacuum.

These results, according to Mr. Waring, are best obtained by enveloping the carbon with a gas consisting of the vapor of bromine, or of the vapor of iodine, or of a mixture of both, the atomic weight of these elements being high. The gas may be generated by heat or otherwise, bromine, for instance, vaporizing easily, but iodine requiring heat. This gas, admitted to the globes and diluted by the air remaining in them, is then partially withdrawn and more gas allowed to enter, this process being repeated until the extent to which the desired gas is diluted with foreign gases has become practically infinitesimal. If preferred, the atmospheric air may be at first exhausted as nearly as possible and the desired gas then admitted around the carbon. The amount of gas to be admitted will in practice vary with the size of the inclosing chamber, with the nature of the gas, and probably also with the nature of the other elements of the lamp. The lamp is placed on the market by Claflin & Kimball, 11 East Adams street, Chicago.

Modern Equipment of Telephone Stations.[1]

By W. H. Hyde.

During the last few years a great advance has been made in the way of improving the talking efficiency of the lines and instruments used by the subscriber, so that at present it is possible for a Milwaukee subscriber, equipped with the modern long distance solid back transmitter and copper wire metallic circuit line, to talk with ease with subscribers at Chicago, Detroit, Cleveland, Pittsburg, New York, Boston and other points.

One of the most important of the improvements introtroduced in the service is the transmitter which is illustrated in Fig. 1. For the use of busy men who do not care to get up from the desk every time they are called, we have what is called an extension desk standard. This form of standard is purely a Milwaukee pattern, and is, I think, by far the neatest and most perfect yet designed.

When it was first suggested that some sort of desk set be offered, we sent for samples of the forms used in New York and Chicago, and found them not at all to our taste, being ungainly and not ornamental. Therefore the management ordered a special device designed for Milwaukee. The standard adopted is the outcome of this suggestion, the design being J. D. McLeod's, and the apparatus used in connection therewith comprising the best ideas of the other members of the company. In Fig. 2 is shown the

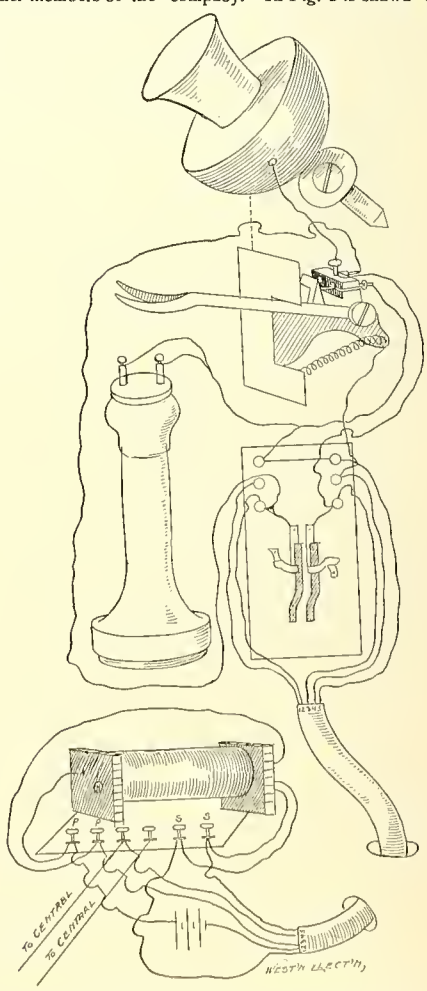


FIG. 2. MODERN EQUIPMENT OF TELEPHONE STATIONS.—DIAGRAM OF CIRCUIT—EXTENSION DESK STANDARD FOR LONG DISTANCE LINES.

standard together with a diagram of the circuit. The standard, I am pleased to say, has met with approval by all the progressive companies that we have sent samples to. A. S. Hibbard, formerly general superintendent of the Long Distance company of New York, now general manager of the Chicago Telephone company, Chicago, was very much pleased with it, as was also F. G. Beach, general superintendent of the Central Union company. Both of these companies have adopted this device with some slight modifications to meet peculiar requirements in their individual cases. The push-button on the side of the standard is used in connection with the Fuller battery, to call central.

1. Read before the Wisconsin Electric club, Milwaukee.

it only being necessary to push the button quickly two or three times, to throw the shutter at central. Most of the banks in the city are using this form of standard in connection with the regular wall set and quite a large number of business houses are also equipped with this little time-saver, and from all reports it is giving general satisfaction.

The regular long distance sets are furnished in two styles—the regular wall set with solid back transmitter, and the cabinet set, the latter being such as is used in public station booths.

The Fuller battery referred to, which is now generally used for all long distance work, consists of the outer cell, containing 6 ounces chloride of sodium, 1 pound sulphuric acid, 4 pounds water; and the carbon plate, and the inner cell, or porous cup, containing 4 ounces mercury, 3 ounces common salt and water to make the inner solution level with the outer solution, and the zinc well amalgamated. One cell will give the following results: 2 volts, 4 amperes (internal resistance at $\frac{1}{2}$ ohm).

Another important adjunct in the equipment of a metallic circuit, is the 1000 ohm bridging bell, the ringers of which are wound to 1000 ohms resistance, for the purpose of bridging out the current, so that it will divide up and pass through all the stations on a line. If the old form of 80 ohm bell were used, the first station on the line would get most of the current, and the others very little, if any. This arrangement is clearly shown in Fig. 3. This bell is also used on grounded circuit toll lines to improve the working of the lines, being bridged to ground, as shown in Fig. 4, instead of looped in as formerly, on the same principal as used in connection with metallic circuits. We have recently introduced a rather ingenious device in connection with this bell on some of our toll lines, as an experiment to see if it were possible to cut down the indiscriminate free use of our lines by our agents in the country, it being a very common practice for them to call up each other and use the line, and then upon a mutual understanding, not "check" the message. This, of course, is a loss to the company and greatly reduces the toll revenue.

The device referred to is very simple and consists of merely putting a bushing on the armature of the bell, which

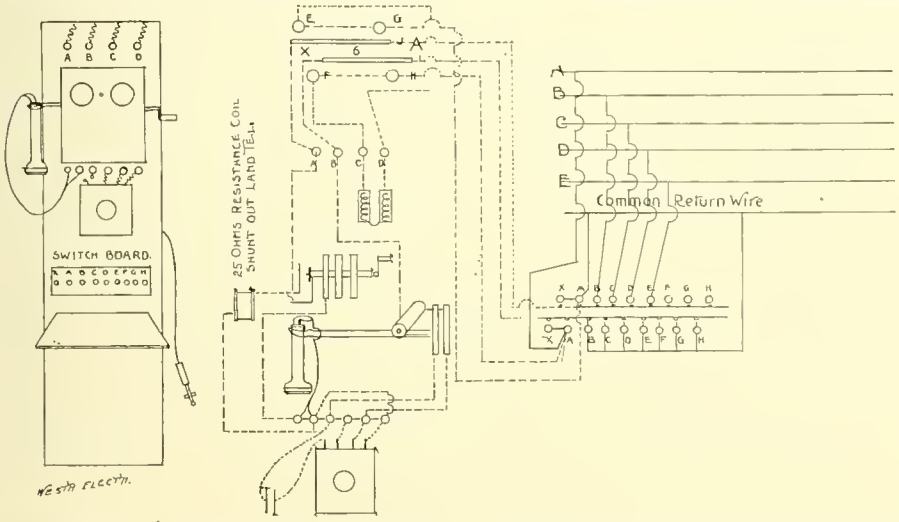

FIG. 5. MODERN EQUIPMENT OF TELEPHONE STATIONS.—AUTOMATIC EXCHANGE SYSTEM.

rotates upon a commutator and only makes contact on one side, thus changing the bell from an alternating to a continuous circuit bell. By this method toll stations on the same line are unable to ring each another's bells, but can throw a drop at the exchange where the line ends. The exchange operator then asks "What is wanted?" and upon receiving the name of station desired, rings on the line with an alternating generator and calls the station wanted. She then makes out a special check, charging up the message to the station that called, and at the end of the month the two reports must agree.

Another innovation is the automatic pay station. We have two of them in use in Milwaukee, one being at the telephone building and the other at the Union depot. The operation of these instruments is very simple, and consists merely of a number of bells of different tone to designate the amount of the coin dropped. The call for central is made in the usual way, and the operator asks what is wanted. She then gets the subscriber called, and before connection is made, calls back and says "fifty cents, please," or whatever the amount may be. The patron then drops in the required amount, which rings the 50-cent bell, the sound being transmitted to the operator via a funnel in connection with the transmitter. These machines are working very nicely and give no trouble whatever, as there is no complicated machinery to get out of order, and they do not require any more attention than the ordinary telephone.

I might mention one more feature, before closing, and that is the automatic switchboard. There are, I believe, at present, two different styles in operation, viz., the Strowger system for all sizes of exchanges from one to 10,000 subscribers and the Central Union Telephone company's system for small exchanges from 1 to 48 subscribers. The Strowger system is probably familiar to you all, as it has been recently described and illustrated. It is a remarkable invention in its way, and shows great ingenuity in its operation. It is worked on the units, tens, hundreds and thousands system; that is, each subscriber is provided with four push buttons, or something similar, together with a release key for disconnection. Desiring to call up anybody, say 286, the subscriber presses the hundreds button twice, the tens button eight times, and the units button six times. At the central office, each subscriber is furnished a little machine that connects with all the other machines, the mechanism being so arranged that as the pushes on the buttons are made, the machine of the subscriber calling automatically throws itself in connection with the subscriber's machine wanted. Should any member desire to study this system more carefully, I refer him to the WESTERN ELECTRICIAN of August 6, 1892, and November 12, 1892. On account of the complicated machinery necessary to operate an exchange of this kind of any magnitude, experts in the business say it will never be a successful commercial venture, although the idea has been carefully and wonderfully worked out.

There is an exchange of this kind, of about 50 subscribers, working at the present time at La Porte, Ind., and I understand that the system is constantly involved in mechanical troubles inherent to it, and that the projectors have had to keep an expert there all the time.

The other system referred to is very simple in its operation and is giving general satisfaction. Its operation is as follows: Say it is the intention to construct an exchange of 48 subscribers. Eight wires are run through the town and into each subscriber's office, six subscribers being placed on each wire. At each subscriber's station, in addition to his telephone, is a small switchboard, let into the backboard of the instrument, containing the necessary jacks to operate the eight wires. The subscriber's telephone ends in a plug, which is ordinarily kept plugged in on the line the subscriber is supposed to be called on, or in an answering jack provided for that purpose. Should he, however, desire to communicate with a subscriber on any of the other lines, he places the plug in on the line of the subscriber wanted and rings the required number of rings and gets his connection immediately. If the exchange is one through which a toll line runs, one of the subscribers is appointed the toll agent, and an extra jack is placed at his station. All calls for tolls are made through the agent, who, with the use of a pair of plugs and cords, makes the connection.

A common return wire is generally run, in addition to the eight wires mentioned, and all the subscribers, instead of being grounded, are connected with this wire, thus making the exchange practically a metallic one. As it will be readily seen, this system can only be used in small exchanges, on account of the cost of the additional wires and apparatus, and the inconvenience of the continuous ringing on busy lines. We are about to build a small exchange at Marshfield, Wis., where we will apply this system. The accompanying cut, Fig. 5, shows a diagram of the connections in this system. The construction of an exchange of this kind must, of course, be of the very best, to keep troubles down to the minimum. An expert is sent every three months to examine all the instruments and give them a general overhauling, thus greatly reducing the chances for trouble.

Complimentary Banquet to W. A Kreidler.

On Thursday evening, May 11th, a complimentary dinner was tendered to W. A. Kreidler at the Chicago Electric club by a few personal friends who desired to extend to him their congratulations upon his recent marriage. The banquet was served in the main dining hall of the club and was a thoroughly enjoyable affair. The following named gentlemen participated: F. B. Badt, E. Baggot, T. P. Bailey, J. P. Barrett, W. J. Buckley, J. B. Carney, W. Forman Collins, Seymour Coleman, F. W. Cushing, F. E. Degenhardt, E. C. Ferguson, C. E. Gregory, F. W. Horne, J. W. Johnson, W. E. Keily, M. A. Knapp, H. P. Lucas, J. B. O'Hara, F. W. Parker, W. B. Pearson, F. L. Perry, George B. Shaw, B. E. Sunny, F. S. Terry, A. S. Terry, Ben Williams.

During the evening Lieut. Badt, on behalf of the company, presented Mr. Kreidler a very handsome hall clock as a mark of esteem and friendship. At the conclusion of the dinner President Barrett called the company to order and named Congressman Shaw as toastmaster. That gentleman performed his duties gracefully and every member of the company was called upon for a response. The affair was informal throughout, and the evening will be remembered as one of the most pleasant events in the history of the Chicago Electric club.

Rapid Transit for Boston.

The rapid transit committee of the Legislature, to which Boston has been looking for relief from congested streets and slow street cars, has given the result of its winter's labors to the public. To an unprejudiced mind the committee's bill bears evidence of an earnest, intelligent study of the situation. The bill proposes an elevated road, to be built not along the lines of established ways but through a special street to be laid out between Washington and Tremont streets. The portions of the bill which are of more than ordinary interest provide that the governor may appoint three commissioners to have charge of the construction of the "L" road and providing better means for transit between the city and all its suburbs. The cities affected are Boston, Everett, Chelsea, Malden, Somerville, Cambridge, Waltham, Newton, Quincy and Medford; the towns are Winthrop, Revere, Melrose, Stoneham, Winchester, Arlington, Belmont, Brookline, Dedham, Hyde Park and Milton.

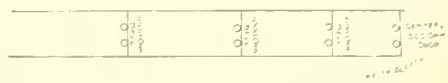

FIG. 3. MODERN EQUIPMENT OF TELEPHONE STATIONS.—BRIDGED METALLIC LINE.

The transit commissioners are to have full and exclusive power to grant and revoke locations for the use of the streets by the railways. The state is to issue bonds to the amount of $15,000,000 to defray the expenses of street widenings, etc., which is to be repaid by the city of Boston from rentals, taxes, etc.

The principal opposition that has arisen to this measure so far relates to the powers given the commissioners. Three members of the committee refused to sign the bill.

The commission is authorized to condemn a right of way from Causeway street to Dudley street, Roxbury, at or near Guild row, thence to Franklin Park, at or near Columbia street, the same to be not less than 25 feet nor more than 35 feet in width; Beverley street from Causeway street to a point at or near the corner of Endicott and Cross streets, thence including Cross street to the corner of Commercial street and Cross street, thence including Commercial street, passing the easterly side of the custom house to India street, thence including India street to Atlantic avenue, also widen Clinton street between its junction with said new street and Fulton street, Boyleston street from Tremont street to Charles street by taking a strip off the common, and making a sidewalk on the southerly side of Boyleston street at least eighteen feet wide; Court street from Bowdoin square and including Tremont row to Tremont street; Cambridge street from Charles street to Bowdoin square; Charles street from Leverett street to Beacon street; a new highway from Park square to point at or near the corner of Pleasant street and Eliot street, and from said point in as nearly a straight line as said commission shall deem practicable, including a part of Warrenton street to Broadway, at the corner of Curve street; a new highway from Causeway street, near Merrimac square, passing under Beacon street to Tremont street, using, if said commissioners deem the public necessity and convenience so require, the mall of Boston Common adjacent to Park street.

A subway bill has also been submitted, providing for a commission of three to lay out and construct a subway wide enough for four parallel tracks, with suitable approaches and exits. It shall extend through Tremont street from its junction with Pleasant street to Scollay square, and may go through Court street or other streets to a suitable point for connecting with surface tracks.

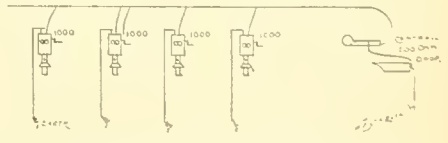

FIG. 4. MODERN EQUIPMENT OF TELEPHONE STATIONS.—BRIDGED GROUNDED TOLL LINE.

The city of Boston may issue $2,000,000 in 50 year 4 per cent. bonds for building the subway. When built the commissioners can compel street railways to use it at a rent to be fixed by the railroad commission. The subway commission may authorize use of the subway for pipes, wires or conduits at a rent to be fixed by them. After the subway has been in operation three months the commission shall be dissolved and the conduit shall be managed by the city.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

THE movement in favor of legal enactments compelling electric railway and cable companies to provide car shelters for motormen and gripmen during the winter months, lately commended in this journal, is spreading. The Ohio Legislature has passed an act of this character, and Minnesota will undoubtedly follow suit, if it has not already done so. Laws of similar purport should be on the statute books of all northern states.

NEW YORKERS are complaining of the humiliating position in which the city is placed in the eyes of the rest of the world through the attitude of the Rapid Transit commission in supplicating favors from the Manhattan company. But New Yorkers have only themselves to blame, as they did not possess enough public spirit to take advantage of the opportunity afforded them to construct an underground system of railways that would forever do away with the Manhattan monopoly. Having tamely submitted to the terms of that corporation, however, they will now be obliged to take whatever is given them.

THE formation of a company for the purpose of disposing of power generated at Niagara Falls is announced this week. It is proposed to transmit this power by means of electricity throughout the state. The project as outlined is a gigantic enterprise and its development will be watched with interest. Should the plans of the company be found practical, the project will form the most important power transmission scheme ever undertaken. There is, of course, no doubt that the power can be distributed by electricity as proposed, but the economical features will have to be carefully studied and determined. At Rochester, for instance, one of the points to be supplied according to the present plans, there is an excellent water power which is utilized by the local electric company. It is therefore questionable if the Niagara company can transmit power to the Flower city and compete with the local company which is operating under favorable conditions.

ANOTHER incandescent lamp in which gas is introduced has been placed upon the market. The new lamp is the invention of John Waring and his claims are presented in detail in another column. Mr. Waring claims to have discovered that if a carbon in a sealed chamber is surrounded by a gas of great specific density, the dissipation of energy by loss of heat from the carbon is reduced, so that as a factor it may be ignored. By using as a surrounding medium a gas which has no injurious chemical effect on the carbon, the disintegration caused by high temperature and the blackening of the glass of the lamp is said to be materially lessened, while the stability of the carbon is proportionately increased. As a result, it is claimed, a lamp is produced which will maintain its efficiency much longer than a lamp having its carbon in a vacuum. These results, according to Mr. Waring, are best obtained by enveloping the carbon with a gas consisting of the vapor of bromine, or of the vapor of iodine, or of a mixture of both. The appearance of this lamp at the present time is significant as indicating the direction which investigators are following in their efforts to produce a perfect incandescent lamp.

LAST week the public was given two opportunities to witness the beauties of the World's Fair in the evening, and the attendance was so large that the directors will undoubtedly see the wisdom of opening the gates every evening after, say, the 1st of June. As pointed out by this journal at the time of the agitation against the evening closing rule, this is the only reasonable course, both in the interest of the exposition at large and in justice to the electrical exhibitors. When the electrical illumination and embellishments are complete, the World's Fair grounds will present a scene of surpassing beauty at night, and there is no valid reason why the exhibition should not be open every evening. Of course the electrical fraternity is a unit in favor of opening the gates in the evening, and undoubtedly the trend of public sentiment is in the same direction. The *Record*, one of the most influential of Chicago journals, has this to say on the subject:

After that great display at the World's Fair grounds Saturday night, the advisability of holding these evening fetes very often is more apparent than ever. Despite one or two hitches in the arrangements, the spectacle presented by the grand court of honor and the perspective views to be seen throughout the grounds were marvelously beautiful. Even the dullest mind and the slowest imagination could not have remained passive before the striking exhibit of glowing temples, moving crowds and distant music. It was one of those rare sights before which it is unnecessary to work one's self into emotions of admiration, simply because it compelled admiration, instant and spontaneous.

Such was the show that thousands of people turned out to see, and their eagerness to come is in itself a demand that the fair be opened at night whenever practicable. Even from the comparatively low standard of purely commercial reasons, the best interests of the Fair require a compliance with this popular wish. The first fete has proved a brilliant success. There should be many more like it.

It will be remembered that the rule on the subject, as it now stands, is that the exposition shall be open after 7 P. M., only on the occasion of "special evening entertainments." When the matter was brought forcibly to the attention of the directors as the result of the agitation begun by the WESTERN ELECTRICIAN, President Higinbotham interpreted the rule to mean that the fair would be open from three to six evenings a week. While this question, like the Sunday opening problem, is not yet definitely settled, there is good reason for the belief that, when everything is running smoothly, the public will be admitted on the evening of every week-day, at least. This should dispose of the matter to the satisfaction of all concerned.

ADVICES from New England show that the fight between the electric and steam railways is not altogether one-sided, and that while the powerful lobby representing the steam railroads in the Connecticut Legislature was able to control the Senate, the friends of the electric railway mustered enough independent members of the lower house to defeat the legislation proposed in the interest of the steam roads. The present controversy has been occupying public attention in New England since the publication of the last annual report of the state railroad commissioners. This report was practically a plea for the steam railroads. It was called out by the proposed extension of several electric lines and the establishment of new ones, which would comprise an extensive system connecting several important cities and giving easy access to summer resorts. Formerly this business had been controlled by the steam roads, but their service was poor, rates were high and in many cases the inhabitants of quite pretentious towns could reach desirable summer resorts only at considerable cost and great inconvenience. Naturally, the people welcomed the electric railway, but the managers of the steam roads did not wish to relinquish their control. Following the report of the railroad commission a systematic plan of securing legislation adverse to the electric companies was followed. The powerful railroad lobby also opposed every bill that contained any features that might be favorable to the electric system. This opposition may yet prevent the passage of the pending bill relating to the organization and powers of the proposed electric railroad companies. The steam railroad companies have exercised their influence successfully in the Senate, where the provisions of the bill have been so changed that the House, which is inclined to favor the electric companies, cannot be induced, it is said, to accept it. For this reason there may be no legislation on this question, owing to the failure of the House and Senate to agree upon a bill. The projected new electric roads and extensions of existing city lines would be of great service to the residents of the city and of the suburban districts, but the opposition of the steam companies to the granting of privileges that may affect their traffic injuriously cannot easily be overcome.

ABOUT two months ago the New York Legislature appropriated $10,000 to defray the expense of conducting experiments in propelling canal boats by electricity. At the present time several projects are under consideration and it is hoped that a practical scheme will be evolved that will prove commercially successful. One of the most promising plans submitted is that of a Buffalo engineer who has worked out the details of a very elaborate system. This scheme in some respects follows the general line of the trolley system of street railways. Power plants will be constructed at regular intervals along the route of the canal, from which current will be supplied by an overhead trolley system to the boats. Three trolley wires will be suspended over the bed of the canal and these will be so adjusted that allowance will be made for a boat departing from its regular course. This, of course, would be necessary in order to allow boats to pass each other and make turns and stops at docks. In the stern of the boat will be placed a motor to drive the screw which will propel the boat.

The same considerations which have led to the substitution of the electric motor for animals upon street railways apply to the propulsion of canal boats by electricity. At the present time, it is the practice to provide accommodations for horses upon the boats, and this means that much valuable space is devoted to stalls and feed bins which could be utilized to advantage. But much more important than mere commercial advantages are the sanitary considerations which should influence the legislature in adopting an electric system. There is no doubt that the presence of horses and mules on the boats is not conducive to good health, and the practice of throwing refuse from canal boats into the sluggish stream is reprehensible. Under the present conditions, however, it is certainly almost impossible to enforce sanitary regulations. New York has a fine waterway in the Erie canal which, if equipped electrically, would be greatly enhanced in value, and would prove an important factor in regulating freight rates. It is to be hoped that the present movement will be followed up until the proposed system shall have been given a fair trial.

Death of A. W. Meston.

A. W. Meston, superintendent of the Emerson Electrical Manufacturing company, St. Louis, died of consumption at his home Friday night, May 12th, after a lingering illness of several months. He had recently returned from a trip to Jamaica in company with E. J. Bagnall. This trip had been taken upon the advice of H. L. Parker, president of the company, and several friends, with a view of benefiting his health, but it proved to be of little benefit, for since returning home about five weeks ago he had been confined to his room or bed almost constantly until his death. Mr. Meston was born near Edinburg, Scotland, twenty-six years ago, and came to this country at the age of fourteen. During the past eight years he had lived in St. Louis, during which time he took a short course in electrical engineering at Washington University. In 1890 he left the university and engaged in the manufacture of electrical apparatus in a small way, in which venture he was associated with his brother, Charles R. Meston. This venture resulted in the organization of the Emerson Electric Manufacturing company in October, 1891, of which he became superintendent and engineer.

Mr. Meston was a close student in electrical matters, both in the university and in the practical work in which he afterward engaged. His special study was that of alternating current motors. His work in this field will probably always be recognized as that of a pioneer, and resulted in one of the first and most successful alternating current fan motors on the market—the Meston alternating fan motor.

Mr. Meston was only twenty-six years of age, hardly yet in the prime of life. Although never strong in constitution he was always a hard worker. His unflagging zeal was almost self-sacrificing until, too late, he was compelled to desist and seek rest. Personally he was a most excellent gentleman, always kind and courteous, yet frank and outspoken with every one. He was a member of the St. Louis Electric club, but owing to late illness he had been unable to take much interest in its active work.

Controversy Over Blue Prints.

No further developments of a sensational character have been published during the week in the controversy between the Westinghouse and General Electric companies over the blue prints which the former charges the latter with having secured through unlawful methods. A dispatch from Pittsburg of May 10th says:

The hearings of Morris W. Mead, superintendent of the city bureau of Electricity, and others charged by the Westinghouse company with conspiracy to purloin blue prints of the Niagara contract from the office of the latter concern, was called this afternoon. All of the defendants, through their attorneys, waived the preliminary hearing and gave bail for trial at court.

The Westinghouse company issued an official statement immediately after this proceeding, reiterating its charges and disclosing that it had in its possession ample proof to sustain them.

William R. Rankin of New York, secretary of the Cataract Construction company, says that corporation is in no way interested in the controversy between the Westinghouse and General Electric companies, and that its division would in no way be affected by the present litigation.

In an interview telegraphed from Pittsburg, District Attorney Burleigh denied a statement in connection with the alleged electrical conspiracy which has been published in New York papers. The story was to the effect that immediately after the arrests in Pittsburg young Ashton, one of the defendants, had gone to Mr. Burleigh and made a full confession of his part in the alleged plot of the General Electric company to steal Westinghouse plans from the main office. Mr. Burleigh says that this story has no foundation whatever, and in his official capacity he has had nothing to do with the case so far. "I do not know Ashton," said the district attorney, "and he has made no confession, so far as known, nor has anyone else. The case up to the present time is in the hands of the private counsel of the electric companies. No papers that I know of have been prepared for the grand jury."

Transmitting Power from Niagara Falls.

A dispatch from Niagara Falls says: "It is understood that a contract has been made between the Niagara Falls Power company and the Cataract Electric company of Rochester, N. Y., by which the former is to furnish to the latter any part of twenty-five thousand horse power of electric energy as soon as the transmission line can be laid from Niagara Falls to Rochester. This power is generated by the waters of the Niagara river passing through the great tunnel which has just been completed." The route will be laid along the line on which the greatest demand is made for power. The distance between Niagara Falls and Rochester is more than 70 miles, and the experiment of transmitting 25,000 horse power this distance will be watched with considerable interest. It is also the intention of the Niagara Falls Power company to furnish power to Buffalo, Tonawanda and Lockport.

Driving Calico Printing Machines by Electricity.

In a recent paper read before the New England Cotton Manufacturers' association C. J. H. Woodbury of Lynn described the successful application of electric power to the printing machines at the Dunnell Print Works in Pawtucket, R. I. He said: "The operation of a calico printing machine presents the greatest difficulties in the application of power of any machinery in textile manufacture. The machine must be driven at will with variable speed, and any shock in the gradations from one speed to another may impair either the machine or the product. The cloth must be moved at times to a slight extent in either direction, and the whole must be absolutely under the control of the operator. Up to the present time a double cylinder steam engine to each machine has furnished the best method of driving, notwithstanding that the heat and the floor area occupied by the steam engine are necessarily an interference in the printing room. When the printing machine stops the rolls sink into the blanket, and it requires an excess of power to start it, as if it were a heavily loaded team on a soft road. The recent application of electric motors has given practical results of the greatest importance in operating printing machines at the Dunnell works. This work was undertaken in the face of the opposition of the men at work in the printing room. There were some difficulties, primarily owing to the fact that the electricians were not skilled calico printers, as well as that the printers were not electricians. It required a little time for each to learn of the other. However, since several modifications in the system were introduced, the operation has been not merely satisfactory, but has given results in advance of any other method of driving a printing machine. This is the first practical use of motors for such purposes."

International Congress of Electricians at Chicago.[1]

By E. Hospitalier.

The provisional programme proposed for the International Congress of Electricians in Chicago in 1893 by the American Institute of Electrical Engineers of New York, has borne fruit. Approvals and criticisms elicited by the programme have shown the value of opening in advance a discussion which is to be settled by the congress in the form of clearly expressed decisions and votes. At the present time when everything or nearly everything has been said upon points of detail, in a rather desultory way it is true, it seems opportune to consider the matter as a whole systematically and methodically, by examining each question in its logical place, and by following the natural order of the successive definitions, which have led to the C. G. S. system. In the following discussion we shall consider only the quantities and units of the C. G. S. system based upon three fundamental measurements, length, mass and time, and their respective units, centimeter, gramme and second. Certain writers still use the phrase "absolute system," but it should be discarded, as it does not sufficiently designate the C. G. S. system. There are many absolute systems of which the C. G. S. adopted by the International Congress of Electricians in 1881 is only one.

The formation of new physical quantities, their names and their units has heretofore been intrusted to the caprice and fancy of writers, and thus it is not unusual to find many definitions of the same physical quantity or unit, or even what is even more serious, the same name applied to several quantities and to absolutely different units.

Is it not possible to do for physics what a century ago Guyton de Morveau did for chemistry, and has not the time come for a congress to define the general rules that should control the naming and defining of quantities and units? If after such modifications as are deemed useful, these rules receive the sanction of the congress, they will greatly simplify the work of future congresses, for it would be sufficient to apply them vigorously to create, automatically, so to speak, the new quantities and new units rendered necessary by the incessant progress of the science and the art.

We shall not assume to formulate the rigid principles and absolute rules which should prevail, but it seems worth the while to lay out the rough canvas upon which more competent and skillful savants may work their graceful arabesques.

Every physical quantity that is distinct from every other physical quantity must be designated and clearly defined once for all in the following respects:

1st. A special name.
2d. An international symbol.
3d. An equation of definition in terms of the fundamental quantities or other derived quantities.
4th. A C. G. S. unit, and for such as are frequently used a special name with corresponding definition.
5th. One or more practical units, multiples or decimals of the C. G. S. unit with corresponding abbreviations, as otherwise the C. G. S. unit and the practical unit would be confused. When the physical quantity admits of standards they should be added.
6th. A fundamental standard for scientific investigations and work necessitating great precision.
7th. A practical standard adapted to the needs of the art.

1st. *Name of Physical Quantities.*—A specific designation is necessary for each physical quantity, but it is not always essential that this name should be a single word. It will be advantageous to adopt rules to govern the designation of new quantities required by practice. We propose to add to physical quantities connected with length the terms respectively linear, superficial or sectional and cubic or volumic to indicate what new quantity is in question; *e. g.*, the linear capacity of a submarine cable, the quotient of its capacity by its length, will be measured in microfarads per kilometer, while the linear insulation of a line, the product of its insulation resistance and its length, will be measured in megohms per kilometer.

The words "kilometric capacity" and "kilometric insulation" possess the prime inconvenience of defining the quantity by introducing a particular unit, the kilometer, while only physical quantities should appear in the definition of a physical quantity.

The energy embraced in a dialectric or a magnet and that dissipated by hysteresis is, in the case of uniform electrization or magnetization, proportional to the volume of the substance considered and to a certain factor to which we have heretofore given the name of specific energy, and which is expressed by $\frac{W}{V}$ where W is the energy and V is the volume. With the rule, which we propose, specific energy would be simply the cubic or volumic energy.

It is understood, of course, that these rules would be applied only in cases where new words were to be formed and that, to cite an example, the quotient of the mass of a body by its volume would preserve its name of density, instead of being called the cubic or volumic mass.

We would wish to go still farther, and find terms to designate physical quantities connected with mass and time.

We wish especially, in proposing rules for forming new physical quantities, to avoid in the future those fantastic definitions, for which the English have been so often responsible, and which consist in writing in a definition physical quantities and units, whereas there should enter into a definition of a physical quantity only physical quantities.

It is illogical to say that speed is a length per second, that power is work per second, that specific resistance is resistance per square centimeter, that magnetic induction is a number of lines of force per square centimeter, that the frequency of an alternating current is the numbers of periods per second.

2d. *Symbols.*—Each physical quantity should be represented in a formula by a particular symbol always the same and adopted once for all, in order that the reading of equations may be facilitated and simplified. The systematic use of italic letters and Greek letters was recommended by the Frankfort Congress in 1891; it remains to establish an international agreement for the definitive adoption of these symbols. We shall indicate later, those which seem to us to have the best chance of adoption.

3d. *Definition Equations.*—In a coherent system of physicial quantities each of them is deduced from those previously defined in a simple equation, which constitutes the algebraic expression of the definition. It is easy to deduce from it the equation of the corresponding equation of dimension by substituting dimensions for each of the quantities that appear in it and by simplifying the expression.

4th. *C. G. S. Unit and Abbreviation.*—The C. G. S. unit of a derived physical quantity is deduced from the equation of dimension by making all its terms equal to a C. G. S. unit. This is the invariable and universally applied rule, and it is unnecessary farther to consider it. It may be useful in practice, however, to give special names to certain of these units which are in frequent use, several magnetic units in particular, as has been done in the case of the dyne and erg.

When the unit is composed of two others it is the rule to unite them by a hyphen if the two units are multiplied, and to separate them by the word "per" if the units are to be divided. (Ampere-hour, watt-hour, meter per second, watts per candle.) The abbreviations of these C. G. S. units will be Roman letters in accordance with the vote of the Frankfort Congress, the abbreviation being formed by the first letter or the first few letters of the name itself.

5th. *The Practical Unit and Abbreviation.*—The practical unit adopted for the measure of a physical quantity will be defined as a multiple or a decimal of the corresponding C. G. S. unit. Abbreviations of practical units will be formed and written in accordance with the rules hitherto mentioned as governing the formation of the C. G. S. units.

6th. *Fundamental Standard.*—Every fundamental standard which serves as the common measure for given physical quantities should be either a copy, as exact as possible, of an accepted standard (meter and kilogramme in the archives), or it should be defined with such precision that it can be reproduced without error or ambiguity.

The Chicago congress in dealing with the matter will be obliged to define two important fundamental standards, one of resistance and one of electromotive force, but to avoid confusion with corresponding standards defined by former international congresses and conferences, it will be necessary to add to each of the standards thus defined a characteristic designation, such as Chicago ohm, ohm$_{93}$, ohm$_{100.5}$, etc. The name ohm without designation should be reserved for the practical C. G. S. unit, which is defined as being equal to 10^9 C. G. S. units.

7th. *Practical Standard.*—It seems difficult for a congress to reach decisions relative to the adoption of practical standards for the measure of physical quantities

1. *L'Industrie Electrique.*

The electrodynamic balance of Lord Kelvin and the ampere standard of M. Pellat constitute true standards for the measure of current strength; a certain number of voltaic combinations give electromotive forces sufficiently constant and of potential well enough known to constitute standards, but their more or less general adoption is a question of detail not within the jurisdiction of a congress. We thought it worth while to call attention to the importance of the matter, but not with a view of urging an international agreement on this score.

Duplex Electric Sinking Pump.

The difficulties heretofore encountered in obtaining an electric sinking pump, light in weight, compact in form, of good capacity and efficiency, and not liable to damage from moisture or hard usage, have been to a great extent overcome in the pump here illustrated. The motor with gearing and operating mechanism is entirely contained in a cast-steel casing, absolutely water-tight. The pumps are of the duplex double acting type, with outside packed plungers. The only moving parts visible are short sections of the plungers and rods. All wearing parts are readily accessible for examination and can be quickly and easily replaced. This pump is not susceptible to damage from water, and its form is such that it will stand considerable hard usage without injury. It will work as well under water as out of it. If, therefore, the precaution is taken to use thoroughly insulated cables for conveying the electric energy to the pump, it may be "drowned" by a sudden rush of water in the mine and still continue operating. This pump is economical in the use of power and has a very high efficiency. It has a capacity of 125 gallons per minute against a vertical head of 200 feet; occupies a space of only 24 inches by 26 inches by 86 inches, and weighs complete 3,000 pounds. Pumps of this type are manufactured in various sizes and are put on the market by the

General Electric company of Boston and New York.

Fig. 1 shows a front view of the pump. Fig. 2 represents a side section.

The Stanley-Kelly Motor.

To the Editor of the WESTERN ELECTRICIAN.

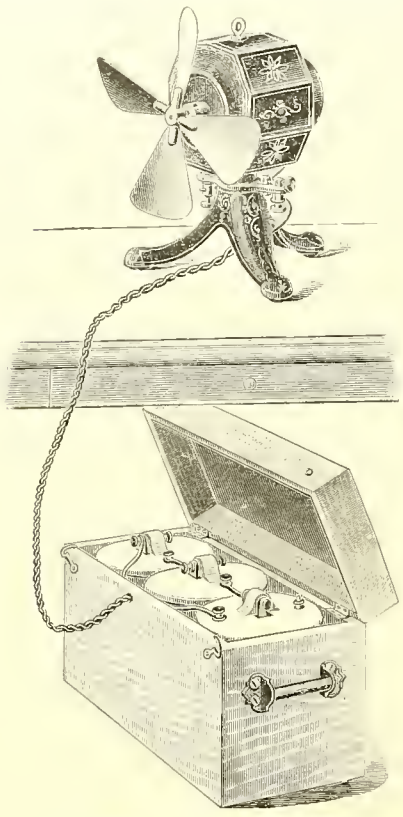
In connection with the article in your issue of the 29th ult. allow us to say that throughout the development of our system we have received great aid from all our associates, and that we are indebted to them for valuable suggestions, especially so to C. C. Cheaney and W. B. Tobey.

WILLIAM STANLEY, JR.,
JOHN F. KELLY

The Macon Electric Railroad company, Atlanta, Ga., will build a line five miles long from Atlanta to the United States barracks.

New Ironclad Battery Fan Motor.

The fan motor illustrated in the accompanying cut, has been designed with special reference to primary battery operation. The friction of its armature bearings and brushes has been reduced as far as practicable, so it may run a 7-inch four-bladed fan at 1,000 revolutions per minute, with 2 amperes and 1.5 volts at the terminals. The battery consists of three Edison-Lalande cells, enclosed in an oaken box. The capacity of one charge in this battery is 150 ampere hours. The armature is entirely enclosed in an iron box or ornamental field frame, with a glass window at one end, through which the brushes and commutator may be inspected.



NEW IRONCLAD BATTERY FAN MOTOR.

The Edison Manufacturing company, 110 East Twenty-third street, New York, manufactures these motors.

CORRESPONDENCE.

New York Notes.

NEW YORK, May 13.—Pending the settlement of the moot point whether engine No. 999 really did travel a mile in 32 seconds, the Broadway company has begun its final series of experimental tests on its road bed and cables, and expects by June 15th to remove all its horses, and give New Yorkers quicker traveling along their principal thoroughfare than they have ever yet enjoyed. The speed of the cable cars is to be limited for a while to six miles an hour, but as soon as the gripmen have graduated in the school of instruction that has been established for them, and are thoroughly familiar with their duties, it is proposed to put the cars along at a lively gait. The rolling stock will comprise 186 new cars. An interesting problem offering itself for solution now is how long, judging by what is taking place in other parts of the country, will it be before the new line is worked by electricity? The cable engineers do admirable work and pave the way for a good electric conduit system.

The negotiations between the Rapid Transit commission and the Manhattan Elevated company are proceeding leisurely. The action of the commission is severely criticized. Although it has in its hands the disposal of a valuable privilege, which the Manhattan Railway company may reasonably be regarded as anxious to secure and to pay well for, it is allowing itself to be put in the position of a supplicant, while it permits the company, which is in reality asking for the privilege, to dictate its own terms. As a leading daily has pointed out, the commission has practically put itself in the position of supplicating favors at the hand of the Manhattan company by abandoning all other means of doing anything for rapid transit. It recognizes the necessity of doing something, and it has virtually admitted that it can be done only through the elevated railroad monopoly. But the city is not wholly dependent upon the Manhattan company. Further transit facilities, even by elevated roads, if that is a necessity, can be obtained without it. Reasonable requirements should be insisted upon, and if they are not accepted, an alternative plan should be adopted and offered for competition. If the Manhattan will not take the present opportunity, which it does not deserve, it should be turned over to somebody else.

Great interest centered on the General Electric stock on the opening of the market on Monday morning on account of the litigation between it and the Westinghouse company. The stock fell 7 1-8 points in the first fifteen minutes, but recovered somewhat before the close of the day. On Wednesday it ran down to 70½ in the face of a very explicit statement by President Coffin that there was no foundation for the rumors that the company is in danger of reorganization, because of insufficient cash resources to to meet its floating debt. Mr. Coffin added that the cash which the company now has on deposit is greater than its entire maturing obligations for the next sixty days, including interest and dividend, and that its obligations and those of its underlying companies have been decreased more than $2,000,000 since the annual statement at the close of the fiscal year; that it has over $4,000,000 unfilled orders on hand, which were all practically taken for cash, and that it is taking no bonds and stock in payment for apparatus as currently reported. To these assurances, which were sent at length over the tapes, was added the further statement that the company was in a perfectly easy financial condition. The stock closed to day at 73, and the chances are that it will exhibit no considerable fluctuation for some time to come.

It is satisfactory to know that in spite of the financial embarrassments of Erastus Wiman, the prospects of the electric light plant at Livingston, Staten Island, which figured so prominently in his assets, are not likely to

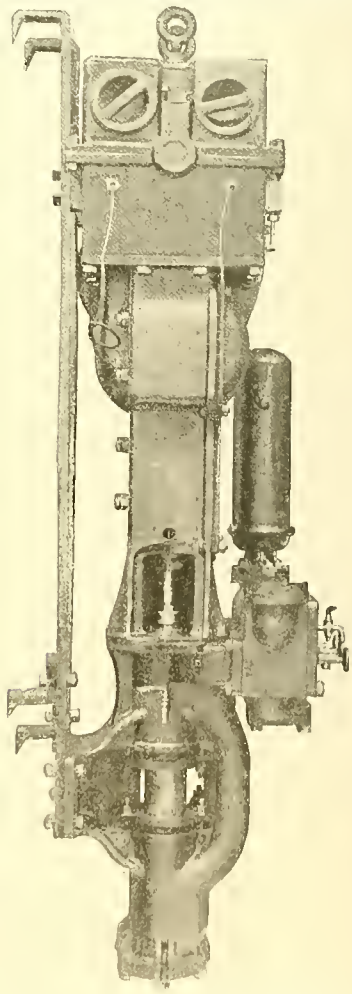


FIG. 2. DUPLEX ELECTRIC SINKING PUMP.

suffer. About $170,000 has already been sunk in the undertaking, and about $130,000 more will be needed to put it into working order. But a large business has already been built up on the island. A considerable demand for power for manufacturing purposes and a large demand for electrical energy to operate electric roads on the island justified the expenditure of a large sum for the Livingston plant, which is now nearly completed. It is asserted that with the cooperation of the company's creditors it will be quite possible to extricate it from its present difficulties. The completion of the plant will be essential to the recovery of the amount invested, and it is said that there is sufficient profit in the business at St. George to

pay the interest on the money necessary to complete the works. The receiver thinks that a satisfactory arrangement will be made with the creditors, and says there is no reason for any anxiety on the part of the Staten Islanders, as the light will be furnished as heretofore.

The attorney for the Thomson-Houston company here has been interviewed in regard to the suit brought by that company to restrain the Winchester Avenue & West Haven Electric railroad company and the Westinghouse Electric company of New York and Pittsburg from operating an electric trolley railroad. This suit is for infringement on a trolley patent taken out by the Thomson-Houston company April 11th. It is a test case which was decided on long before the patent was granted, and the Thomson-Houston company is now pushing it in accordance with a pre-determined plan and quite independently of the trouble between the General Electric and the Westinghouse Electric companies. The patent granted to the Thomson-Houston company is claimed to cover two parts of the trolley now used on the roads equipped by the Westinghouse Electric company. It will probably be a month before an answer is filed by the Westinghouse company and the New Haven company, and it may be three or four months before a preliminary hearing is reached.

A syndicate with $4,000,000 capital was formed in this city yesterday to construct and equip an electric transmission line from Niagara Falls to Albany. The route of the line has not been fully determined upon. It is, however, expected to supply the cities, towns and villages on the way with electricity for light, heat and power. Central stations are to be built at various places, from which current will be distributed. The syndicate is said to represent interests allied with those concerned in the construction of the Falls tunnel.

The trouble between the striking electric linemen and the Brooklyn City railroad was amicably settled on the 11th inst. It was agreed that the men should receive $3 a day according to their demand. Those of the strikers who had obtained work in other cities were notified and returned to work. No agreement has been reached between the union and the Citizens' Electric Lighting company.

The strike among the linemen of the New York & New Jersey Telephone company continues, and fifteen more telephone linemen, employed by the company in Staten Island, went out on a strike two days ago for an advance from $2.50 to $3 a day.

Dr. Cyrus Edson sends from Washington some news that will be gratefully received in Chicago. He went to Washington to find out if the government authorities have more information about the cholera than is obtainable in New York. He says: "Their advices are of the same tenor as ours, and are very reassuring. There is no cholera in Europe now, except in Russia, and the outlook is good that we will not have a visitation of the scourge this year." Dr. Edson sees further cause for satisfaction at this prospect from the fact that "the presence of cholera in the United States this year would be a tremendous misfortune. It would mean the collapse of the World's Fair and the financial ruin of thousands." W. F. O.

New England Notes.

BOSTON, MASS., May 13.—The storage battery petitioners, who ask for the use of the tracks of the West End street railway, have again demonstrated their strength in the Legislature. The bill giving them this right was passed to its third reading by a large majority. William S. Hall, one of the petitioners for the incorporation of the storage battery company, president of the Hopedale Electric company, which controls the patents of the Milford & Hopedale Street Railway company, reports concerning a month's trial of the Milford cars, that "for thirty days our cars ran on an average over 200 miles per day. To propel these three cars we used five batteries, and the total cost of running each car per mile was 19.34 cents; to this we add 7-10 of a cent per car mile for taxes, insurance against fire 27-100 of a cent per car mile, insurance against accidents 34-100 of a cent. per car mile, damages not covered by accident policy 27-100 of a cent per car mile. This makes the total cost per car mile 20.92 cents. The same cost on the West End road for the year ending September 30, 1892, was 27.42 cents per car mile, and the average cost per car mile on all the street railways of the state was 25.19 cents per car mile. We have operated our cars for two years giving uninterrupted service all the time including Sundays. They have frequently been loaded to their maximum capacity, but this has never caused any trouble even on the ten per cent. grades. We have carried upwards of 280,000 passengers without an accident." In the face of these statements Prof. Dolbear of Tufts College and other electrical experts state unqualifiedly that the storage battery can not be made a commercial success in the operation of street railways. The city of Ansonia, Conn., which has become interested in the matter, has sent a committee to examine into the operations of the Milford road and report if it is a commercial success. One member of this committee is a Trinity College professor.

The fight made in the Connecticut Legislature by the steam roads against their electric rivals has taken a decided and unexpected turn in favor of the latter. On May 3d, the House of Representatives amended almost beyond recognition a bill passed by the Senate for the regulation of electric street railways. The chief feature of the bill as it came from the senate was a provision prohibiting the paralelling of a steam railroad by an electric street railway without the permission of the railroad commissioners, and also forbidding electric roads to carry freight. The action of the house came as a result of a reaction against the high handed methods of the steam companies, who were attempting to thwart legitimate enterprise and prevent competition. It is understood that the Senate will maintain its position, in which case the success of the numerous street railway companies which have applied for charters will be endangered.

The Legislature has at last produced something as the result of its long continued series of hearings, which looks as if an intelligent attempt were really to be made to solve the rapid transit problem. The committee on railroads has reported a bill providing for the erection of a gigantic union station for the railroads entering Boston on the north and east. This, in fact, was what the Boston & Maine company was contemplating, but the Legislature has embodied a feature that goes far beyond anything that has been proposed by the railroad companies. This station is to be an elevated one and built so as to enable passengers to be transferred direct to the cars of an elevated street railroad, should such a road be built. And were it not probable that such an "L" road were to be built one can be sure that such a provision would not have been included. The three stations now operated and used by the Boston & Maine company and the section of the Fitchburg railroad are to be consolidated. The plan is elaborate in its details. It provides that the Boston & Maine company shall do the work. In compensation for the accommodations the Fitchburg company is to receive a satisfactory rental which it shall pay for these privileges. The commonwealth and the city of Boston are also included, for it is provided that the commonwealth shall from time to time, as the work progresses, pay over to the Boston & Maine company 35 per cent. of the outlay it has made. Of this 35 per cent., the city of Boston is to pay the commonwealth two-sevenths or 10 per cent. of the whole cost. The penalty for refusing to build this station is set at $500,000 with $5,000 a month additional penalty for neglecting to submit plans for the approval of the railroad commissioners. The plan also includes a complete rebuilding of the various railroad bridges and draws over the Charles river. All grade crossings are to be abolished. The estimated cost of the whole project is $7,000,000. But the railroad people say it will cost several millions more than this figure.

The legislative committee on mercantile affairs gave a public hearing on the matter of underground wires on Monday evening. There was a lively discussion, and many of the companies affected were represented by counsel who took strong ground against the bill to create a separate commission with the most arbitrary powers. The companies represented were: New England Telephone company by S. L. Powers, Edison Electric Light company by J. C. Wardwell, Massachusetts Electric Light association by E. W. Burdette, Boston Electric Light company by E. W. Burdette, Mutual District Messenger company by D. J. Hearn. Beside these President F. A. Gilbert of the Boston Electric Light company and F. A. Houston of the New England Telephone company were present. The representatives of the electric companies criticised the bill because it gave unlimited authority to the commissioners who are to superintend the removal of the wires, and is to take effect all over Boston at once, instead of specifying certain parts where the wires might be removed from time to time. They object to the companies being dictated to by a commission, only one member of which knows anything about such business. The bill would not affect at all a great number of overhead wires such as the burglar and police alarm systems and numerous private wires.

The Worcester board of aldermen has imposed the severest conditions ever known in New England in granting franchises for electric street railways lately. The State Central Street Railway company has the past week been given permission to build in three streets to the Shrewsbury line provided it paves one of these streets for half a mile its full width and macadamizes the other two streets. It is also required to widen the bridge over the Boston and Albany railroad, and also a causeway across the lake. Several other franchises have been granted with conditions in most instances requiring either the complete paving of streets or macadamizing. All such franchises must be accepted in 30 days.

The new municipal electric lighting plant of the town of Peabody has been turned over to the town authorities. The total cost of the plant has been nearly $50,000. The building is of brick and put up according to mill construction with a granite foundation. The boiler room contains two 125 horse power tubular boilers. The capacity of the engine is 150 horse power, which is about half as much again as is required at present. Four Edison arc dynamos are in use provided with Schuyler regulators. The town is thus wired in four circuits, each dynamo being interchangeable on the circuits and independent. Forty miles of wire are used in lighting 23 miles of streets.

The tracks of the Brockton street railway are to be extended to East and West Bridgewater and Bridgewater this spring. All the stock has been subscribed for to make these extensions. The road now takes in Brockton, Whitman, Avon, Randolph and Holbrook.

The Taunton city council has given the Taunton Street Railway company permission to operate double tracks by electricity from Weir Bridge through Weir street, City square and Broadway to Bay street. This is to be an outlet from Taunton for three separate lines.

The New England Telephone & Telegraph company has purchased the Young Men's Institute at 7 Chardon street and is to tear it down and erect a new building to be used as its West End exchange.

The Fall River Electric Light company has petitioned the Legislature for permission to furnish electric power as well as light.

The contract for rebuilding the car house of the West End street railway at Everett, which was burned some months ago, has been let. The plans call for a building 283 feet long and 80 feet wide. There will be an addition of brick 105 feet long and 16 feet wide. This is to contain six fire-proof apartments. The building is to be ready for use in about two months.

A bill to incorporate the Malden, Melrose & Stoneham Street Railway company has been reported to the legislature. It provides that any power other than steam may be used.

An Atlanta, Ga., syndicate is negotiating with the Boston capitalists who own the road for the purchase of the Atlanta Consolidated Street Railway.

The Northampton Street Railway company has been granted a franchise to extend its tracks and put in electric power. The next day a majority of the stock was bought by men interested in the Springfield Street Railway company. These capitalists now own 60 miles of track in three adjoining Connecticut valley cities.

The owners of the Fairhaven & Westville Horse Railroad of Connecticut made $55,000 recently without turning a hand. A Boston syndicate, headed by A. C. Pond, president of the Winchester Avenue road of New Haven, Conn., paid this amount to horse railroad officials for an option to buy their road for $1,500,000. They were given until April 15th to raise the balance. Mr. Pond searched Boston, New York and Philadelphia in a vain effort to raise the money and consequently the capitalists are mourning the loss of their money while the horse railroad is that much in.

Five suits against the West End Street Railway company of Boston have been brought by passengers in an electric car which suddenly became ignited through a defective motor. The suits were for $5,000 each, but the jury awarded $250 to one man and smaller sums to the others.

The Clinton Street Railway company has been given permission to build 10 miles or more of electric road in that town, the main line to run from the Lancaster town line to the Berlin town line with branches to the trotting park, the Catholic cemetery and the South Clinton station of the Central Massachusetts railroad. The company is to allow any or all of the lines which ask for franchises to run over its rails by making satisfactory financial arrangements. The new line must be completed by November next. It is owned mainly by E. C. Swift of Chicago.

The Lynn & Boston Street Railway company now runs only electric cars between Chelsea and Boston, gaining 18 minutes on the old horse car schedule.

L. D. Dumouslin, who resigned recently as superintendent of the West End Street Railway department, has gone into the electrical underground conduit business.

The Edison Illuminating company is to put in a 360 light dynamo for an isolated plant for Fobes, Hayward & Co., candy manufacturers.

The Brockton & Stoughton Street Railway company has received a location between the two cities. Four and one

half miles of rails will be laid, work being begun at once.

The Worcester board of aldemen has granted a franchise to the Consolidated Street Railway company to double-track its line to the village of Quinsigamond on condition that it pave the street nearly the whole distance. On one street the company is compelled by the terms of its franchise to pave 18 inches each side of the track and macadamize the remainder of the street.

The New Hampshire Legislature has changed the name of the Laconia & Lake Village Horse Railroad company to the Laconia & Lakeport Street Railway company and authorized an increase of ca ital from $30,000 to $100,000.

The East Middlesex Street Railway company, with sixteen miles of track running from Woburn to Revere Beach has been purchased by the North Shore Traction company.

The Newton & Boston Street Railway company has decided to establish a power plant and furnish its own power for the operation of its line from Newtonville to Newton Upper Falls.

An electric road, for the benefit of summer tourists, is proposed from the village of Bethlehem, N. H., to the top of Mt. Agassiz.

The Brockton Street Railway company has leased the Holbrook & Brockton street railway for 99 years.

Boston capitalists have secured control of the Woonsocket street railway. They will make electric extension up the valley.

The assignee of the Germania Electric company reports that the liabilities exceed $100,000. The assets are figured at about $27,000. Of this amount $5,000 is for lamps on hand which would really be worth $25,000 were it not for the injunction which the Edison company has secured.

The Leominster & Fitchburg Street Railway company is to equip its lines with electricity this year.

The Rockland & North Abington Street Railway company has contracted for 10 Westinghouse car equipments and two 150 horse power generators.

J. C. E.

Northwestern Notations.

MINNEAPOLIS, May 13.—Joseph M. Green, Chamberlain, S. D., has sued the Western Union Telegraph company for $10,000. Mr. Green is chairman of the state Republican committee and he claims that last fall at the beginning of the campaign he made a contract with the company for a private wire into his private office, to be used by his operator. About three weeks before election the Democrats discovered that the private wire had been strung from the main wire outside the city. It was possible for an operator to hear in Green's office all messages received in or sent out of Chamberlain. The matter came to the attention of Superintendent McMichael of Minneapolis, who ordered the wire cut, and Green was compelled to get his messages through the offices. He brought suit against the company, claiming that during the last days of the campaign lack of wires seriously inconvenienced him in directing political work. The company sets up a general denial to the charge that it had a contract with him. The case was set for hearing last week, but was postponed to the fall term of court at plaintiff's request, and an effort will be made to avoid a trial.

It is believed that an ordinance has been framed that will solve the St. Paul street railway riddle. The board of alderman has passed it and the assembly is said to be ready to do so at the earliest opportunity. It is acceptable to the company, concessions having been made at several points. The new measure does not touch either the interurban transfers or the through line to Hazel Park. It simply calls for the immediate construction of a line to Lake Como, allows until June 1, 1894, for the completion of the Maria and Stryker avenue lines, and provides that no new lines shall be ordered until September 1, 1895. The change of the Seventh street cable to an electric line is not insisted upon, but Mr. Lowry will probably make the change.

Dow S. Smith, the new superintendent of the Twin City Rapid Transit company, has arrived in Minneapolis and assumed his duties at the central station. Since the promotion of Willard J. Heild to the general managership, the company has been without a superintendent.

Charles J. Glidden, secretary and treasurer of the Northwestern Telephone company, has been in Minneapolis and St. Paul, accompanied by J. W. C. Pickering and Charles E. Adams, directors of the company. They are on their semi-annual tour of inspection. Mr. Glidden says the telephone business is increasing very fast in the twin cities, last year being the most prosperous in the company's history. The Northwestern company will at once complete a new pole line to St. Paul, as the present one will not carry any more wires. It will also build lines from Shakopee to Mankato, Anoka to St. Cloud, and Hastings to Winona.

The city council at Marshfield, Wisconsin, has entered into a contract with the Marshfield Water, Electric Light & Power company for lighting the city for five years at the annual rental of $1,800 per year. The contract calls for 23 arc lights of 2,000 candle power.

The Columbian Electric company of St. Paul has filed a schedule of its assets and its liabilities, from which it appears that the former, including $15,323.56 book accounts, amount to $55,727.43, and the latter to $27,747.75. The Anchor Investment company, which holds notes to the amount of $11,000, is the heaviest creditor. The company has sued to recover $10,829.41 on four promissory notes.

There is a rumor that the Bryant avenue end of the Lyndale car line in Minneapolis is to be extended to the shores of Lake Harriet, but the officials of the company have not confirmed the report.

C. N. Parker of the Brainerd electric street car line has been elected president of the board of trade at Brainerd, Minn.

The Western Union Telegraph company has notified its employes in Minneapolis that hereafter all over-time put in by the operators will be computed at the rate of seven hours for a day's work.

The Minneapolis fire deparment is to be supplied with ten telegraph poles and 150 miles of wire.

The Northwestern Water & Light company of LeMars, Ia., has been organized; capital stock, $200,000. The officers of the company are: President, J. H. Whinchell; vice-president, Dr. M. W. Richey; secretary and treasurer, J. K. Alline. The new company will extend the facilities of the plant, and will also build, equip and operate electric light and water works plants at other places.

There has been incorporated at St. Cloud, Minn., the Water, Light & Power company, with a capital stock of $300,000. This includes the Water Works company, Water Power company and Electric Light company, and it is organized under the new act of the Legislature. The incorporators and officers are: President, H. M. Byllesby; secretary, J. A Chase; treasurer, N. O. Searle, and William Westerman. The limit of bonded indebtedness is $1,000,000, The dam will be raised three feet and other improvements made.

The partnership known as the Sneller Electric company has been dissolved. John W. Sneller withdraws. It is a Minneapolis firm.

The case of the Fargo Gas & Coke company against the Fargo Gas & Electric company was decided in favor of the plaintiff, the jury's verdict giving the plaintiff the full amount asked, $17,000. The latter company in March, 1889, purchased the plant of the former for $85,000. It refused to pay $13,000 on the ground of false representation, and was sued. The Gas & Electric company will appeal.

The Hartman General Electric company of Duluth will at once begin the extension of the incandescent line to Oneota, and will make other improvements.

City Engineer Cooper of West Superior, Wis., has furnished the common council an estimate for an electric light plant to be owned by the city. It is designed to supply an arc light circuit and its cost is estimated at about $100,000. Mr. Cooper says the cost of a complete system of arc lighting to cover the territory now covered, using 300 lights of 2,000 candle power each, will be $61,738. This contemplates twenty-eight miles of wire, 2,480 poles, 6 dynamos, of 60 horse power capacity each, a three hundred horse power compound engine, a brick building 50 by 100 feet, and one lot on water front. The full capacity of the plant would be 300 lights.

C. P. Wainman, Minneapolis, superintendent of the Northwestern Telephone Exchange company, has been at Sioux Falls, S. D., making arrangements for a complete remodelling of the telephone system of that city. About $5,000 will be spent.

G. A. Van Schriltz of Grand Forks, N. D., is contemplating putting in a telephone exchange at Crookston, Minn. He wants to construct a line from Crookston to Grand Forks.

Work has been commenced on an electric light plant at Chamberlain, S. D., for lighting the city.

It does not seem probable that Fargo and Moorhead will secure any street railway lines for the present. It is understood that the men represented by Mr. Bowman will not be able to secure from the councils of the two cities such franchises as they demand.

The case of Ilida Nelson against the Twin City Rapid Transit company is a peculiar one, and opens up a new idea in damage suits. It appears that the lady settled her claim some time ago with the company and signed a release of all claims against it. Afterwards she was not satisfied, and wanted to sue, and for the purpose of doing so claimed that she did not know how sick she was at the time of the settlement.

The St. Paul fire department has had considerable trouble with the Chandler fire alarm boxes, and agent E. B. Crandall, representing the company, has been sent on to see if he can rectify the difficulty. It is claimed that several bad fires could have been avoided had the alarm system done its work properly.

Murray Snell, for many years manager of the Western Union Telegraph company at Watertown, S. D., has been transferred to West Superior, Wis. He will be manager there.

The latest report from Deadwood, S. D., is to the effect that work will be begun soon on the proposed electric motor line from that city to Leadville.

The new car barn at Superior, Wis., will have accommodations for 13 double tracks. Offices for the superintendent and others will be provided in the building.

The electrical station for the Water, Light & Power company of Superior, Wis., will consist of two buildings, one for arc lighting and one for the incandescent system. Both buildings will be of brick and iron, and very complete in their equipments.

Egbert G. Handy, a St. Paul real estate man who failed this week, says that his trouble is due partly to the drain on his resources through his connection with the Columbia Electric company, which recently failed.

T. B. Walker and other capitalists interested in the proposed electric line from Minneapolis to Lake Minnetonka are said to be negotiating with J. J. Hill, of the Great Northern road, with a view to leasing his line to cover part of the distance.

N. L. P.

PERSONAL.

Elmer A. Sperry of the Sperry Electric Railway company is in Chicago. Mr. Sperry spends the greater part of his time at present in Cleveland, O.

NEW INCORPORATIONS.

Suffolk Gas company, Islip, N. Y; capital stock, $200,000; to manufacture and use gas and electricity for light, heat and power.

Huntington Electric Light, Heat & Power company, Huntington, N. Y.; capital stock, $20,000; to manufacture and use electricity.

American Electric Heating corporation, Portland, Me.; capital stock, $5,000,000; to manufacture and deal in all kinds of electric heating apparatus; Drummond & Drummond, Portland, Me.

Wallkill Valley Electric Light & Power company, Walden, N. Y.; capital stock, $16,000; manufacturing and using electricity.

Warrenton Electric company, Warrenton, Mo.; capital stock, $5,600; operating electric light plant; Peers & Morsey, Warrenton, Mo.

Texas Electric Burglar & Fire Alarm company, Corsicana, Tex.; capital stock, $30,000; to manufacture and sell electric burglar and fire alarms; D. L. Blackmon, Corsicana, Tex.

Spangler & Hastings Electric Railway company, Bellefonte, Pa.; capital stock, $42,000; constructing and operating an electric railway in Cambria county, Pa.; W. F. Reeder, Bellefonte, Pa.

Suburban Railway company of Philadelphia, Philadelphia, Pa.; constructing and operating an electric railway in Philadelphia, Pa.; William Jenks Fell, 131 South Fifth street, Philadelphia, Pa.

Philadelphia & Rosemont Passenger Railway company, Philadelphia, Pa; capital stock, $150,000; constructing and operating an electric railway in Philadelphia; Paul W. Smith, 411 Walnut street, Philadelphia, Pa.

Eureka Coal company, Seattle, Wash.; capital stock, $100,000; to own and operate coal and other mines, railroads, docks, wharves, electric light and power plants, etc; Preston, Albertson & Donworth, Seattle, Wash.

Chicago Electric Transit company, Chicago, Ill.; capital stock, $150,000; to locate, lease and operate street railroads with such power as necessary; Willits, Robbins & Case, 318 Home Insurance building, Chicago, Ill.

East End & Sharpsburg Electric Railway company, Pittsburg, Pa.; capital stock, $300,000; constructing and operating an electric railway in Pittsburg, Pa.; Edward Fell Lukings, 812 Girard building, Philadelphia, Pa.

Electric Traction company of Philadelphia, 2501 Kensington avenue, Philadelphia, Pa.; capital stock, $50,000; supplying motor power to passenger railways, etc.; William Henry Lex, 51 North Sixth street, Philadelphia, Pa.

Manchester Electric Truck company, Manchester, N. H.; capital stock, $600,000; to manufacture and sell trucks, wheels, motors, engines, machinery, cars, tools, and electrical appliances; David Cross, Manchester, N. H.

Pricesburg Electric Light company, Dickson City, Pa.; capital stock, $20,000; supplying light, heat and power by means of electricity, etc., to persons, partnerships, and associations residing in or adjacent to Dickson City,

Lackawanna county, Pa.; Patterson & Wilcox, Library building, Scranton, Pa.

Signal Alarm company, New Orleans, La.; capital stock, $10,000; to do general dealing in patent rights and to manufacture and vend electrical appliances under the Hall-Lillard patents; Isaac Kinsey, New Orleans, La.

Clay City Manufacturing company, Clay City, Ind.; capital stock, $25,000; to manufacture and sell cooperage material, purchase or lease timber lands and timber, and to do electric lighting and generate power; B. M. Gnirl, Clay City, Ind.

Grand Island Rapid Transit, Light & Power company, Grand Island, Neb.; capital stock, $250,000; to construct and operate a street railway by electricity, horses, mules or cable, and to furnish power in the streets of the city of Grand Island, Neb.

Bliss Engineering company (incorporated in West Virginia), Washington, D. C.; capital stock, $500,000; buying, selling, contracting and operating electric supplies, plants, etc., for railways, lighting, etc.; Needham & Cotton, 14-15 Sun building, Washington, D. C.

United Electric Light & Power company, Bayonne, N. J.; capital stock, $50,000; to construct, maintain and operate works for the supply and distribution of electricity for electric light, heat and power, etc.; VanBuskirk & Parker, Fuller building, Jersey City and Bayonne, N.J.

Equitable Dynamo company, Chicago, Ill.; capital stock, $100,000; to manufacture and deal in electrical machinery, appliances, etc., to erect and operate plants for generating and supplying electric light, heat and power; Reed & Brown, Home Insurance building, Chicago, Ill.

Pine Bluff Water, Gas & Electric Light company (incorporated in West Virginia), New York, N. Y.; capital stock, $500,000; purchasing and constructing water works, gas works and electric light plants in Pine Bluff, etc.; Hobbs & Gifford, 58 William street, New York, N. Y.

ELECTRIC LIGHTING.

The Salisbury, Md., electric light plant was destroyed by fire recently. The loss is $16,000.

James H. Garrett of Anaconda, Mont., proposes to erect an electric light plant at Bonner's Ferry, Idaho.

The Electric Light company of Springfield, Mass., contemplates building a $125,000 power station at Indian Orchard.

The city council of Medford, Mass., has authorized the mayor to petition the Legislature for a special act to construct and operate an electric light plant.

The electric light plant at La Junta, Colo., was destroyed on the evening of May 10th. It is stated that an explosion took place and blew up the building leaving it a total wreck, killing one man and seriously injuring others. The plant was owned by McComb & Brannon of Denver, was valued at $20,000 and is a total loss.

ELECTRIC RAILWAYS.

A survey is being made for the building of an electric railroad between Carlisle, Ky., and Sharpesburg.

It is stated that the Chicago & North Shore electric street railroad will be opened for operation June 11th.

The street railway company of Escanaba, Mich., will build several extensions to its lines the coming summer.

Double-decked storage battery cars have been operating in Paris from La Madelaine to St. Denis for more than a month, and are said to be giving satisfaction.

It is stated that the extension of the electric line from Pikesville to Arlington, Md., will be completed by June 1st. The extension will consist of seven miles of track.

The Detroit Suburban Railroad company, Detroit, Mich., has been granted a franchise by the village of Grosse Point to extend its line to the eastern limit of that village.

The Globe Street Railway company, of Fall River, Mass., has completed the work of changing its motive force to electricity. The company has about 24 miles of track and one of the finest plants in the country.

The elevated portion of the Lake Roland electric railroad was tested on May 2d, by running a motor over it to the center of the city. The Roland Park division of the line will be in operation to the down town terminus in a few days.

The Buda-Pesth Tramway company, Austria, which has been operating its lines by horse power, has been amalgamated with the electrical town undertaking. If this agreement is carried out Buda-Pesth will have an electric tramway system on a gigantic scale.

The General Electric company has just completed an electric locomotive for the Crescent Beach branch of the Boston & Maine road, and it is stated that the locomotive will be employed regularly to haul goods and passenger carriages over the branch mentioned.

The Third Street Railway company, Dayton, O., is experimenting with a storage battery car, which, it is said, is proving satisfactory. The total number of miles of street railroads contemplated in Dayton by recent ordinances is about 50, or double the present street railway mileage in the city.

The Southwest Missouri Electric company, which is building an electric line connecting Carterville and Webb City with Joplin, Mo., is considering plans to extend the line to Carthage and to Galena, Baxter Springs and Kansas City. Baxter Springs offers a right of way and water power free. The road, if constructed, will be 40 miles long.

The East Side Railway company, Portland, Ore., has opened its standard gauge electric line, fifteen miles in length, from East Portland to Oregon City. The Portland General Electric company supplies current from its Oregon City station to Milwaukee, or about half of the distance. The remainder of the line is operated from the East Side station in Portland. An hourly service is given.

The work of building the electric railroad from Mayfield, Cal., to the Stanford University will begin shortly. It is said that the storage battery system is to be tried on this line. The name of the corporation is the Mayfield & Stanford University Electric railroad. The route is from the Southern Pacific depot at Mayfield up Lincoln street to Yale street in College Terrace; thence, through Palo Alto avenue to Bowdoin street; thence, to Mayfield thoroughfare, to a point opposite the quadrangle of the class rooms. This is as near as Senator Stanford will permit any company to approach the university. He has announced his purpose to lay a track from the quadrangle to the Mayfield thoroughfare, a distance of about a quarter of a mile. The company will be permitted to run its cars over this track to the quadrangle. The new electric road is built for the accommodation of students who reside in Mayfield and College Terrace, and for those who desire to reach the former point to take the cars either for San Jose or San Francisco.

POWER TRANSMISSION.

The General Electric company of New York, through the Grand Rapids Electric company, has closed a contract with the Western Michigan Electric company for the electrical apparatus to be used in the transmission of electrical power from Lowell.

At the last meeting of the Lynn board of aldermen the Thomson-Houston company asked permission to lay wires underground from its present works on Center and Federal streets to the river works. This is for the purpose of transmitting power from the power house, which will be located on the marsh, to the Center and Federal street works. These works will be run with the power generated at the power house.

LEGAL DECISIONS.

A message filed with a telegraph company at a city in Texas, addressed to the sender's agent in California read as follows: "Close the trade. I will come soon." On his arrival the sender discovered that the message had not been delivered, and that the deal had failed, thus requiring him to return to Texas. The court held that his expenses to and from California were proper items of damages against the telegraph company, but losses resulting from the sale of his property at a sacrifice before starting were not. The telegraph company having received full pay for transmission of the message to its destination, without any contract limiting its liability to its own line, was bound to deliver the message to the sender's agent, even though it had to be sent part of the way over the line or another company. The sender's testimony showed that the message was not written on a blank contract of the telegraph company, and that, when he returned from California, he examined the original copy, which was not then attached to one of such blanks. The company's agent testified that when he received the message he immediately attached it to a blank contract form, and that he was not authorized to receive or send a message unless on such blank. The testimony justified the court in finding that the message was not attached to a blank contract form when received by the agent.

Two telegraph companies made a written agreement whereby one was to build and equip certain lines and connect them with those of the other. The second was to issue and deliver to the first its bonds secured by a mortgage on all its property, including the lines contracted for. On the next day, this second company agreed with the stockholders of the first to exchange those first company bonds for first company stock in equal amounts. The bonds were issued and exchanged as agreed, the second company thereby getting control of the first, electing its own officers to the offices of the first, and managing the two companies as one concern. The new lines were built in part by the second company, as contracted, and connected with the system of the first company, the second raising the money therefor by issuing its own bonds secured by a mortgage covering after-acquired property. This mortgage was not recorded until after the recording of the mortgage by the first company. In the agreements and the acts done in pursuance thereof, there was nothing contrary to law or good morals. The act connecting the new lines with those of the first company, and their use as a part of the first company's system, was a sufficient delivery of them under the contract, and the new lines then became subject to the first company's mortgage, and the lien thereof took precedence of the second company's mortgage. A foreclosure sale of the new lines under the second company's mortgage, or the sale of part thereof under a judgment, would not affect the rights of the first company's mortgagees, they not having been parties to either suit. United Lines Telephone company vs. Boston Safe Deposit & Trust company, 13 Sup. Ct. Rep. 396, Jan. 30, 1893.

MISCELLANEOUS.

Fire destroyed electrical machinery of the Union Electric company, New York, last month to the amount of $5,000

It is rumored that the Canadian General Electric company is contemplating purchasing the Royal Electric company of Montreal and the Ball Electric company of Toronto. By buying out the former company, the Canadian General Electric company secures the Thomson-Houston patents for Canada on arc lighting.

The power house, car house, and cars of the Grand View Beach railroad, running between Charlotte and Manitou, two pleasure resorts near Rochester, N. Y., were destroyed by fire last week. The loss is estimated at $60,000 in addition to this summer's traffic, as the road cannot be equipped for several months.

The Western Electric company of Chicago has a base ball team of which it is proud. On Saturday of last week the nine played with an aggregation known as the Coals, defeating it after an interesting contest by a score of 9 to 6. The game was played at Washington Park, and the batteries were: Western Electric, Smith and Hunstock; Coals, Murray and Wink.

George Westinghouse, jr., has applied to the United States Circuit Court in New York for an injunction against the General Electric company, to prevent it from using in the manufacture of converters a device which he claims to have invented and patented. He also asks for an accounting of the profits made by the General Electric company while using this device.

The Westinghouse Electric & Manufacturing company has received a contract from the Philadelphia Traction company for 600 motors and 8,500 horse power in generators. It also has the contract to supply all the electrical apparatus to be used on the line in that city. It is claimed that this is the largest contract that has ever been let to any electric company for street railway apparatus.

W. M. Stine, who has taken charge of the department of electricity and electrical engineering at the Armour Institute, Chicago, announces that this department is being equipped for technical work of the highest grade. Its aim is to do work which differs from other technical schools in this respect. While laying full stress on theoretical training, it intends to combine as much of the practical as circumstances and time will permit.

The Concord Land & Water Power company, Concord, N. H., has purchased from the Gas & Electric Light company all its electric apparatus, franchises, poles and lines. It will also utilize the water power at Garvin's Falls in the Merrimac River. This gives the Land & Water Power company the entire control of the electrical interests in the city and removes its chief competitor. It has now about 10,000 horse power available for electrical and manufacturing purposes.

TRADE NEWS.

D. W. Davis, western manager of the Phœnix Iron Works company, has recently moved into more commodious quarters at 519 Rookery, Chicago.

The New York Insulated Wire company, New York, has issued its World's Fair edition of its catalogue and price lists. The book is compiled in a neat manner, and is fully descriptive of this company's assortment of wires and tubing.

The Redding Electric company of Boston, Mass., has removed its offices to 336 Congress street, where it will have increased facilities for handling its growing business. This company's catalogue of Iona specialties is a comprehensive book and will well repay perusal.

W. R. Brixey, manufacturer of Day's Kerite wires and cables, New York, has taken the contract to manufacture and lay for the Metropolitan Telephone & Telegraph company two No. 18 conductor submarine cables, similar to the nine in service at the present time between New York and Jersey City, under the North River.

I. L. Faucett, Quincy, Ill., has issued a neat little advertising hand-book called "Scraps for Engineers," the object of which is to place engineers, firemen, etc., in correspondence with leading representative houses in the country in mill supplies, steam engines, boilers, pumps and other mechanical devices. It contains several concise tables of valuable information of interest to engineers.

The Ball Engine company, of Erie, Pa., has received orders during the past week for one 100 horse power cross compound engine from the Compania Mexicana Del Gas y Luz Electrica; three 100 horse power tandem compound condensing engines from the Fond-du Lac Light, Power & Railroad company, and one 130 horse power engine from the International Electric company, Salt Lake City, Utah.

The Hanson Battery & Power company, of Washington, D. C., after two years of practical contact with the lines of electrical trade, is now making what it claims to be one of the best batteries on the market. A large number of installations have been made in the East and West for power to run launches, lighting plants, pumps, etc., and none but the most satisfactory reports have been received from them.

The Electric Appliance company is supplying its customers and the general trade with a complete catalogue of the Meston motor, showing its various adaptations for ventilating, dental, sewing machine and light power work. The Emerson company is a pioneer in this field of electrical work, and as this is the first catalogue of the kind ever published, it makes very interesting reading, and contains valuable information for central stations supplying alternating currents.

Cummings & Engelman is the style of a firm which has recently been organized in Detroit for the purpose of doing electrical construction work, succeeding Cummings & McCoy. The firm is composed of two capable and energetic young men and proposes to get its share of the

business in the West by good workmanship, moderate prices and careful personal supervision. Especial attention will be paid to underground work and the transmission of power. Mr. Cummings' conduit for underground conductors will also be exploited. The office of the firm is at 25 Cleland building, Detroit, Mich.

The Ansonia Electric company, Chicago, is having excellent results with its new street railway appliances for overhead construction. The new material is guaranteed both for strength and insulation, and has received the indorsement of railway experts. The Ansonia Electric company has added to its list of contracts for overhead equipment the road thirteen miles in length, running between Goshen and Elkhart, Ind. This company has also recently secured a thirty ton order for its P. & B. line wire.

Diehl & Co. of New York are sending to the trade neat little pocket pamphlets, with illustrated description of their type of motor, with price list, etc. This motor is used in connection with the exhaust disc wheel combination. Another pamphlet is an illustrated catalogue of the Diehl electric fans. The special feature of these fans is that no shafting or belting is required. Each fan contains its own motor, wound for 110 volts or under, continuous incandescent, or for any number of amperes continuous arc circuit. It can also be effectively operated in series on a 220 volt or 500 volt street railway current.

Taylor, Goodhue & Ames have received the best proof that their moving from 827 Monadnock block to 348 Dearborn street, Chicago, was a wise step, by the increased number of orders that they are receiving from city customers. The demand for the Wagner direct current fan motor continues very large, and it is reported that these motors are giving the best of satisfaction. The demand for alternating motors, both for power and fan work, continues to be very satisfactory. Taylor, Goodhue & Ames keep a large stock of these motors continually on hand so that any unnecessary delay in shipping and consequent annoyance to the purchaser is avoided.

The Ansonia Electric company, Chicago, is calling particular attention at this season, preparatory to the approaching warm weather, to its stock of Edison fan motors run by the Edison-Lalande battery. The company's stock of fan motors is very extensive, consisting mostly of seven and nine inch outfits. The seven inch outfit is complete, with chemicals sufficient to run the motor for 70 hours continuously, and the nine inch outfit to run the motor for 100 hours continuously. In addition to the fan motors, the Ansonia company is well stocked with the Diamond carbon battery. This battery is a favorite among physicians, and the many testimonials received by the company endorsing its merits are a source of much gratification.

The several new buildings of the Page Belting company, Concord, N. H., which have been in process of construction for some time past, are now completed. The largest of the buildings, the belt shop, is three stories high and 264 by 58 feet. It is fully equipped with new and special machinery for the manufacture of belts. Electricity is the company's principal motive power, and it possesses an extensive system of electric lighting in its buildings and on its grounds. A monster belt was recently completed by the company for exhibition at the World's Fair. It is 102 inches in width and more than 200 feet long, and is probably the largest belt in the world. Two other large belts have been turned out, one 72 inches and the other 73 inches in width, and they are intended to drive Westinghouse dynamos for lighting the buildings at the fair.

BUSINESS.

The Conover Manufacturing company of New York is now located at 39-41 Cortlandt street.

The Peckham Motor Truck & Wheel company of New York has moved from 45 Broadway to the Havemeyer building.

Manager W. C. Brown of the New York office of the Wainwright Manufacturing company of Boston will hereafter be found at 68 Cortlandt street.

The Backus Water Motor company, Newark, N. J., has changed its name, and all communications to this company should be hereafter addressed to the Backus Manufacturing company.

The Ansonia Electric company, formerly the Electrical Supply company, Chicago, recently closed another contract in Iowa for Helios arc lamps, to be used in street and commercial lighting.

W. R. Ostrander & Co., manufacturers of speaking tube and electric bell supplies, 197 Fulton street, New York, have moved to 201 Fulton street, where they have increased facilities for carrying on their growing business.

Sixteen carloads of material for the new boiler plant of the North Shore Traction company have arrived at the power station in Salem, Mass., and the work of erection will be pushed forward rapidly. The boilers are of the National water tube type, manufactured by the National Water Tube Boiler company, of New Brunswick, N. J., and are representatives of the most advanced practice in modern boiler construction.

Taylor, Goodhue & Ames expect that much interest will be created among World's Fair visitors by the exhibit of their alternating current power motors. Two of these will be installed in their exhibit in electricity building; one two horse power coupled direct to an exhaust fan, and one ten horse power which will operate a direct current generator. These motors are single phase, no special circuit being required for their operation.

The firm of H. Ward Leonard & Co., New York, has met with success in its peculiar line of bulk electric contracting which is most satisfactory. The business of the company amounted to $530,000 during the first year, and its business is increasing rapidly, both in New York and throughout the country. Since the first of January the capital of the company has been doubled, the fully paid capital now being $120,000.

J. G. Brill & Co., Philadelphia, manufacturers of electrical cars and car equipments, claim to be the only firm in the country which equips cars electrically in every particular prior to shipment. All cars and trucks built by the Brill company and equipped before shipment are tested on the company's private track, one-third of a mile in length, including sharp curves and heavy grades, insuring accuracy in the electrical work as well as certainty of operation when the cars reach destination.

The Phœnix Iron Works company, manufacturer of automatic engines, boilers, heaters, etc., Meadville, Pa., reports constantly increasing sales. Both engine and boiler departments are crowded and working overtime. Additions to the works are contemplated to take care of increasing business. Among some of the more important recent sales may be mentioned eight horizontal tubular boilers, 1,200 horse power, for the Allentown, Pa., Street Railway company, two 300 horse power condensing compound engines for the Saginaw, Mich., Power company, and numerous others.

The Chicago readers of the WESTERN ELECTRICIAN will be pleased to learn that Frank S. Bishop, Chicago representative of the Illinois Central railway, has been promoted to the position of superintendent of ticket agents for his company. Mr. Bishop will have charge of the Chicago terminal district, with his office at 58 Michigan avenue. Mr. Bishop, it will be remembered, is the gentleman who, in company with Jesse Scribner, of the western department of the General Electric company, made such a success of the St. Louis convention train. Mr. Bishop on this trip made many friends for his road among the convention delegates, who will be glad to learn of his promotion.

Word has just been received from Alfred C. Einstein, president and treasurer of the Consolidated Engineering company, Security building, St. Louis, that his company has just succeeded in securing in Nashville, Ill., a contract for a 40 light arc and 650 light incandescent plant, together with an Ideal engine and steam plant. The contract in Nashville includes the building and, in fact, the entire construction of the plant throughout. The Consolidated Engineering company has opened an electrical supply house and will carry a full line of everything in electrical goods, from the smallest screw to the largest dynamo. The officers of this company are well known in the electrical business as energetic men, and it is safe to predict that they will make a success of this new branch of their business.

ELECTRICAL PATENTS.

Issued May 9, 1893.

496,859. Transfer System for Telephone Switchboards. Emery A. Clark, Sioux City, Ia.

496,863. Apparatus for Electrolysis of Salt. Thomas Craney, Bay City, Mich.

496,864. Electrolytic Apparatus. Thomas Craney, Bay City, Mich.

496,865. Electrolytic Apparatus. Thomas Craney, Bay City, Mich.

496,871. Electric Meter. Oscar Ericsson, Sioux Falls, S. D.

496,878. Galvanic Battery. Charles W. Holtzer, Brookline, Mass.

496,882. Electric Arc Lamp. Martin Kruegar, Chicago, Ill.

496,890. Method for Welding Metal. Arthur J. Moxham, Johnstown, Pa.

The method is more particularly designed for welding pieces having varying widths throughout the cross-section. The ends of the pieces are cut away at points where the width is greatest, so that the thinner parts will come in contact, transmit the welding current and become welded before the thicker parts come in contact. By this means a weld of equal strength throughout the entire cross section is obtained.

496,896. Contact for Underground Electric Railways. William O. Prewitt, Lexington, Ky.

496,901. Switchboard for Electric Circuits. Albert L. Rohrer, Lynn, Mass.

496,904. Multiple Switchboard Apparatus. Charles E. Scribner, Chicago, Ill.

The apparatus is designed for metallic circuits, and the subscriber's generator, when operated, is brought automatically into a circuit formed by grounding the open limb of the metallic circuit at the subscriber's station, the limb thus grounded being connected through the subscriber's annunciator and battery to ground at the central office, the other limb of the metallic circuit being normally open at the central office and being connected with the test pieces of the switches of the line, and being branched to a normally open contact spring of a grounding switch. The subscriber's generator, when not in use, is shunted to remove its resistance from the circuit. A combined calling, listening and grounding switch is provided of such construction that when the plug is lifted the operator's telephone and the individual annunciator are bridged across the strands of the cord of the loop plug.

496,905. Multiple Switchboard System. Charles E. Scribner, Chicago, Ill.

The subscriber's bell is placed in a normally closed ground branch, and the subscriber's generator and telephone are so arranged that when the telephone is on the switch the telephone will be shunted and the generator included in the circuit, while, on removing the telephone from the switch the generator will be shunted and the telephone brought into circuit, the ground branch through the bell being opened also by the removal of the telephone.

496,906. Multiple Switchboard Testing Apparatus. Charles E. Scribner, Chicago, Ill.

496,907. Testing Aparatus for Multiple Switchboard Systems. Charles E. Scribner, Chicago, Ill.

The telephone lines are connected through the metallic circuit with the different switchboards the limb of each circuit which connects with the springs and test pieces being normally grounded through the subscriber's bell when the telephone is hung up, while the other limb is normally open at the subscriber's station. The limb which is grounded is permanently connected through the high resistance individual annunciator of the line at the central office. The connections are such that when the terminal plug of one line is inserted in the spring jack switch of another line the opposite corresponding limbs of the two circuits will be reciprocally connected together; that is, that limb of the circuit connected with the sleeve of the plug will be connected with the test portion of the other line, while the test portion of the first line, which is connected with the tip of the plug, will be connected with the limb of the other line which extends to the spring of the switch in which the plug has been inserted.

496,918. Safety Connection for Induction Coil Systems. Elihu Thomson, Lynn, Mass.

The invention is designed to prevent accident caused by coming in contact with an electric circuit normally of low tension, when the latter shall have accidentally come in contact with a high tension circuit which is grounded at some point. A device is included in a grounded circuit from a low tension line which is adapted to be actuated when said high tension current shall reach said line to open up a connection to ground of low resistance, and thereby shunt the body of the person in connection with the low tension line.

496,945. Electric Traveling Crane. William H. Morgan, Alliance, O.

496,959. Apparatus for Utilizing Solar Heat. Melvin L. Severy, Boston, Mass.

496,962. Dynamometer. Joseph A. Wade and John Cherry, Hornsea, Eng.

496,963. Dynamometer. Joseph A. Wade and John Cherry, Hornsea, Eng.

497,001. Method of Making Conductors for Armatures. Rookes E. B. Crompton, Chelmsford, Eng.

497,014. Process of Separating Precious Metals From Ores. Frederick W. Cleghorn, Salt Lake City, Utah.

497,023. Means for Displaying Advertisements. Edward O. Hart, Chicago, Ill.

497,024. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa.

The trolley makes contact with a series of sectional conductors, each section being connected by a branch with the supply conductor. In the branch is included an electro-magnetic device of high resistance, but so adjusted that the strength of the current passing through the same when the trolley arrives upon any section, will be sufficient to attract an armature which closes a short circuit between the section upon which the trolley has reached and the supply conductor.

497,025. Overhead Electric Railway. Rudolph M. Hunter, Philadelphia, Pa.

497,038. Electric Lamp. John Waring, Manchester, Conn.

An incandescent lamp is filled with a gas composed wholly or largely of elements of high atomic weight, as bromine, the bulb of the lamp being hermetically sealed to retain the bromine. The inventor claims that, by thus using a gas of high atomic weight, air washing of the carbon is prevented.

497,061. Electric Railway Switch. Edward F. Stone, Hyde Park, Mass.

497,062. Shoplifting Detector. Fred Sturtevant, Charlestown, Mass.

497,104. Automatic Switch for Mast-arms. William A. Turbayne, Detroit, Mich.

497,110. Multiphase Electric Motor. Paul A. N. Winand and Carl O. C. Billberg, Philadelphia, Pa.

The invention consists in winding the coils of the armature, which are supplied with alternating currents of different phases, so that the coils overlap each other, and this in such a manner that each coil has a magnetic effect on the core greatest at the center of the coil and diminishing towards the opposite ends of the coil, where it laps or is overlapped by the other coils.

497,111. Grain Binding Machine. William Bayley, Springfield, O.

497,113. Transformer Motor. Otto T. Blathy, Buda-Pesth, Austria-Hungary.

The motor comprises two magnetic fields lying in parallel planes and preferably at right angles to each other. The fields are excited by coils supplied with alternating currents of phases differing by 90 per cent. A single armature is provided whose coils extend into both fields. Since the magnetic fields are at right angles the maximum strength of the one will occur at the time of the minimum strength of the other, and the currents thus induced in the coils of the armature cause the latter to rotate.

497,117. Magnetic Ore Separator. Charles G. Buchanan, New York, N. Y.

497,120. Electrical Circuit. Charles E. Chinnock, Brooklyn, N. Y.

497,123. Commutator for Electric Generators or Motors. Midbury W. Hassan, Rochester, N. Y.

497,129. Electro-plating Apparatus. Albert R. Reams, Elmira, Cal.

497,144. Pedal Switch for Electric Motors. Levi Teal, Philadelphia, Pa.

497,197. Portable Electric Abrading Device. Aaron J. Nellis, Pittsburg, Pa.

497,200 Electric Lamp Support. James Nortney and Frank Schefold, New Albany, Ind.

497,203. Electric Time Stock Feeder. Herbert S. Page, Medford, and Livy Spear, Boston, Mass.

497,251. Coupling for Electric Light and Gas Fixtures. George Peeples, Philadelphia, Pa.

497,263. Electric Cigar Lighter. William P. Carstarphen, jr., Denver, Colo.

497,281. Signal Transmitting Apparatus. Morris Martin, Malden, Mass.

497,293. Trolley Wire Support. Henry A. Hamlin, Minneapolis, Minn.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, 10 strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

ESTIMATES SUBMITTED. 809-817 S. Seventh Street, ST. LOUIS, MO.

$25 to $50 per week, to Agents, Ladies or Gentlemen, using or selling "Old Reliable Plater." Only practical way to repair rusty and worn knives, forks, spoons, etc.; quickly done by dipping in melted metal. No experience, polishing or machinery. Thick plate at one operation; lasts 5 to 10 years; fine finish when taken from the plater. Every family has plating to do. Plater sells readily. Profits large. W. P. Harrison & Co., Columbus, O.

HAVE YOU EXHAUST STEAM GOING TO WASTE?

Are your FEED WATER HEATERS obtaining the best results, in heating and purifying the feed water for your boilers? Are you heating your buildings with live steam or exhaust?

IF YOU DESIRE TO GET BETTER RESULTS from your present feed water heaters, and to heat your building by exhaust steam, without back pressure upon engines, saving power and water of condensation, together with **GREATER ECONOMY IN FUEL**, send for our catalogues of **Webster Vacuum Feed Water Heater and Purifier, and Williames Vacuum System of Steam Heating**, which contains some of the largest plants in the United States as references. We visit plants in any part of the United States, at our expense, furnish our apparatus, which may be attached to your present plant, upon trial, under guarantee.

Patentees, Proprietors and Manufacturers of the Webster Vacuum Feed Water Heater and Purifier.

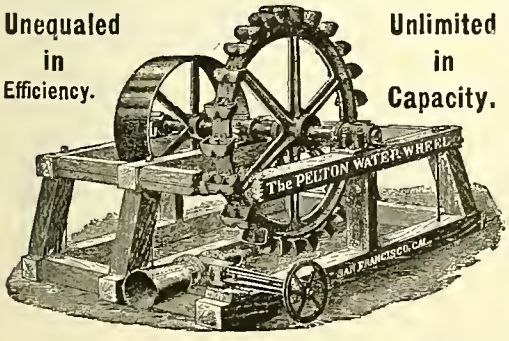
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

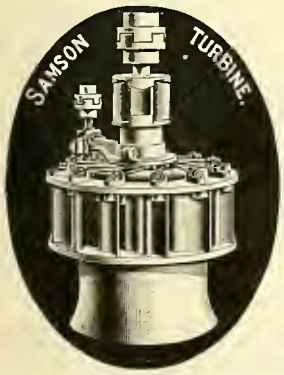
THE PELTON WATER WHEEL CO.,

121-123 Main St., San Francisco, Cal., U. S. A.

143 LIBERTY STREET, - - NEW YORK.

☞ It having come to our notice that our patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted.

PELTON WATER MOTORS. Varying from the fraction of 1 to 15 and 20 horse power, unequaled for all light running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ Send for Motor Circular. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates.



JAMES LEFFEL WATER WHEELS

Thie Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

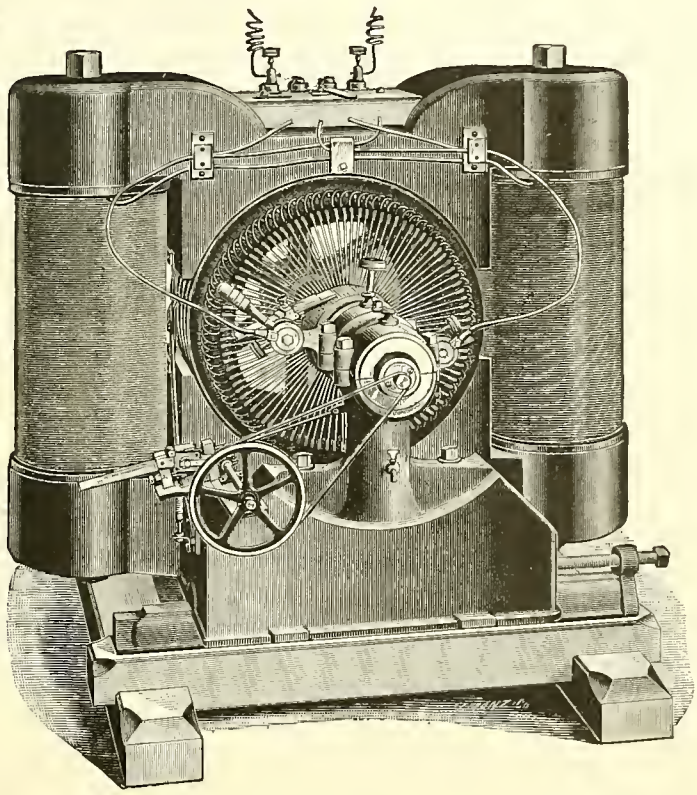
BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



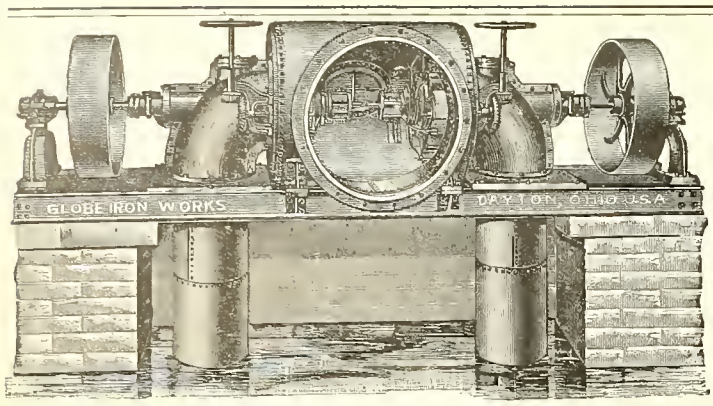
ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.



THE NEW AMERICAN
TURBINE WATER WHEEL.

PARTICULARLY ADAPTED TO DRIVING

Electric Light and Power Stations

On account of its high efficiency at all stages of gate, steadiness of motion and easy working gate, the construction of which makes it the most sensitive to the action of a governor of any wheel on the market.

Orders for APPARATUS, REPAIRS and SUPPLIES formerly furnished by the United States Electric Lighting Co., Newark, N. J., should now be sent to this Company, where they will receive prompt attention.

BRANCH OFFICES IN ALL THE LEADING CITIES.
AGENTS FOR CANADA: AHERN & SOPER, OTTAWA, ONT.

"NOVAK"

(TRADE MARK.)

We take pleasure in informing the public that after many months of experimenting we have succeeded in producing an incandescent electric lamp superior to any of the numerous lamps hitherto offered to the public. The importance of the discovery may be realized when we inform you that the lamp now manufactured by us is a total departure in principle from all other incandescent lamps. Our lamp will maintain its INITIAL CANDLE POWER at its INITIAL EFFICIENCY throughout the usual average life of incandescent lamps.

The importance of this improvement can only be realized by those who have had he usual experience with lamps which begin to DECREASE IN CANDLE POWER, and at the same time INCREASE THEIR CONSUMPTION OF ENERGY as soon as put into service.

THE "NOVAK" LAMP MAINTAINS ITS FULL CANDLE POWER AT THE SAME EFFICIENCY THROUGHOUT ITS LIFE.

The "Novak" lamp is fully protected by patents of our own, and is free from any possible claims of infringement of other patents.

The efficiency and average life of the "Novak" lamp are fully equal to those of any other lamp ever offered.

The filament used in the "Novak" lamp is the celebrated "PERKINS" FILAMENT the superior quality of which is too well known to need comment by us.

We respectfully solicit correspondence in regard to the "Novak" lamp, feeling sure that a lamp possessing the superior qualities of this lamp, and manufactured by a company whose business it is to supply the general public WITHOUT DISCRIMINATION, will be appreciated.

"STANDARD" Single Push Button Flush SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this switch single pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt current or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

Weston Standard Portable Direct-Reading HIGH RANGE AMMETER (One-half Size.)—In Ranges up to 500 Amperes.

These instruments are very compact, and of the highest accuracy attainable. In the latest models the instrument is wound with a material without temperature coefficient; the instruments may therefore be **LEFT IN CIRCUIT CONTINUOUSLY** without being affected in the least by the passing current.

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters. (See Illustration.)

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

Vol. XII. CHICAGO, MAY 27, 1893. No. 21

Electricity at the World's Fair.

To the practical man there few plants in the electricity building that will appeal more strongly than that of the Fort Wayne Electric company, which is illustrated on this page. The installation also has the distinction of being one of the first in the department to be completed, and it now carries a considerable proportion of the arc and incandescent lamps burning in the building. The plant is located in the southwestern portion of the building, on the ground floor, in the space known as section M. It is especially noteworthy from the fact that, although confined exclusively to the products of the Fort Wayne company, it forms a working exhibit of nearly every system of electric lighting in commercial use, including high and low tension and alternating arc lighting and direct current and alternating incandescent work. One dynamo is also shown that may be run on the three-phase system. Power is furnished by two Wood direct current motors—one of 125 horse power and the other of 80—which take current from the 500 volt circuits supplied from the company's generators in machinery hall, in which building the company also has an exhibit of fourteen Wood arc dynamos, which from a portion of the Exposition company's service plant. These two large motors drive a fine line of countershafting supplied by the Falls Rivet & Machine company of Cuyahoga Falls, O., which is completely equipped with friction clutches, shaft couplings and all the needful mechanical devices for power control. From this line of shafting are driven a Slattery 1,300 light alternator, a Wood 1,500 light alternator, a Wood 40 light arc machine and two Wood direct current incandescent dynamos, one of 400 lights and the other of 250 lights capacity. The Slattery machine is of the familiar type, as are also the Wood continuous current incandescent and arc dynamos. The Wood alternator, however, is a new machine and a separate view of it is given in Fig. 2. This dynamo is iron-clad and of the slow speed type. High claims are made for its efficiency, and particular attention has been paid to the ventilation of the armature, which is said to be indestructible. The lines of the machine are very graceful and it presents an extremely handsome appearance. The exhibit includes a number of other dynamos in addition to those enumerated. Among these is a 120 light Wood arc dynamo, wound for a maximum potential of 6500 volts. This is thought to have the greatest capacity of any arc machine yet constructed. It is not a pleasant machine to handle, however, as may be readily imagined, and is probably too dangerous for ordinary commercial use. It does not differ from the ordinary Wood arc dynamo in appearance, although somewhat larger. One interesting feature of the exhibit is shown in Fig. 3, which represents a small alternating current dynamo built by James J. Wood in 1879, and which in 1880 was awarded the medal for superiority at the American Institute Fair. The machine is mounted on a wooden beach and is driven by a Wood motor of 1½ horse power capacity supplied with a 500 volt current by concealed wires. The little dynamo is equipped with a commutator, rendered extraordinary by the fact that it is so arranged that either direct, alternating or three-phase current can be taken from it without stopping the machine to perform the necessary manipulation. The dynamo is also remarkable in that, although constructed thirteen years

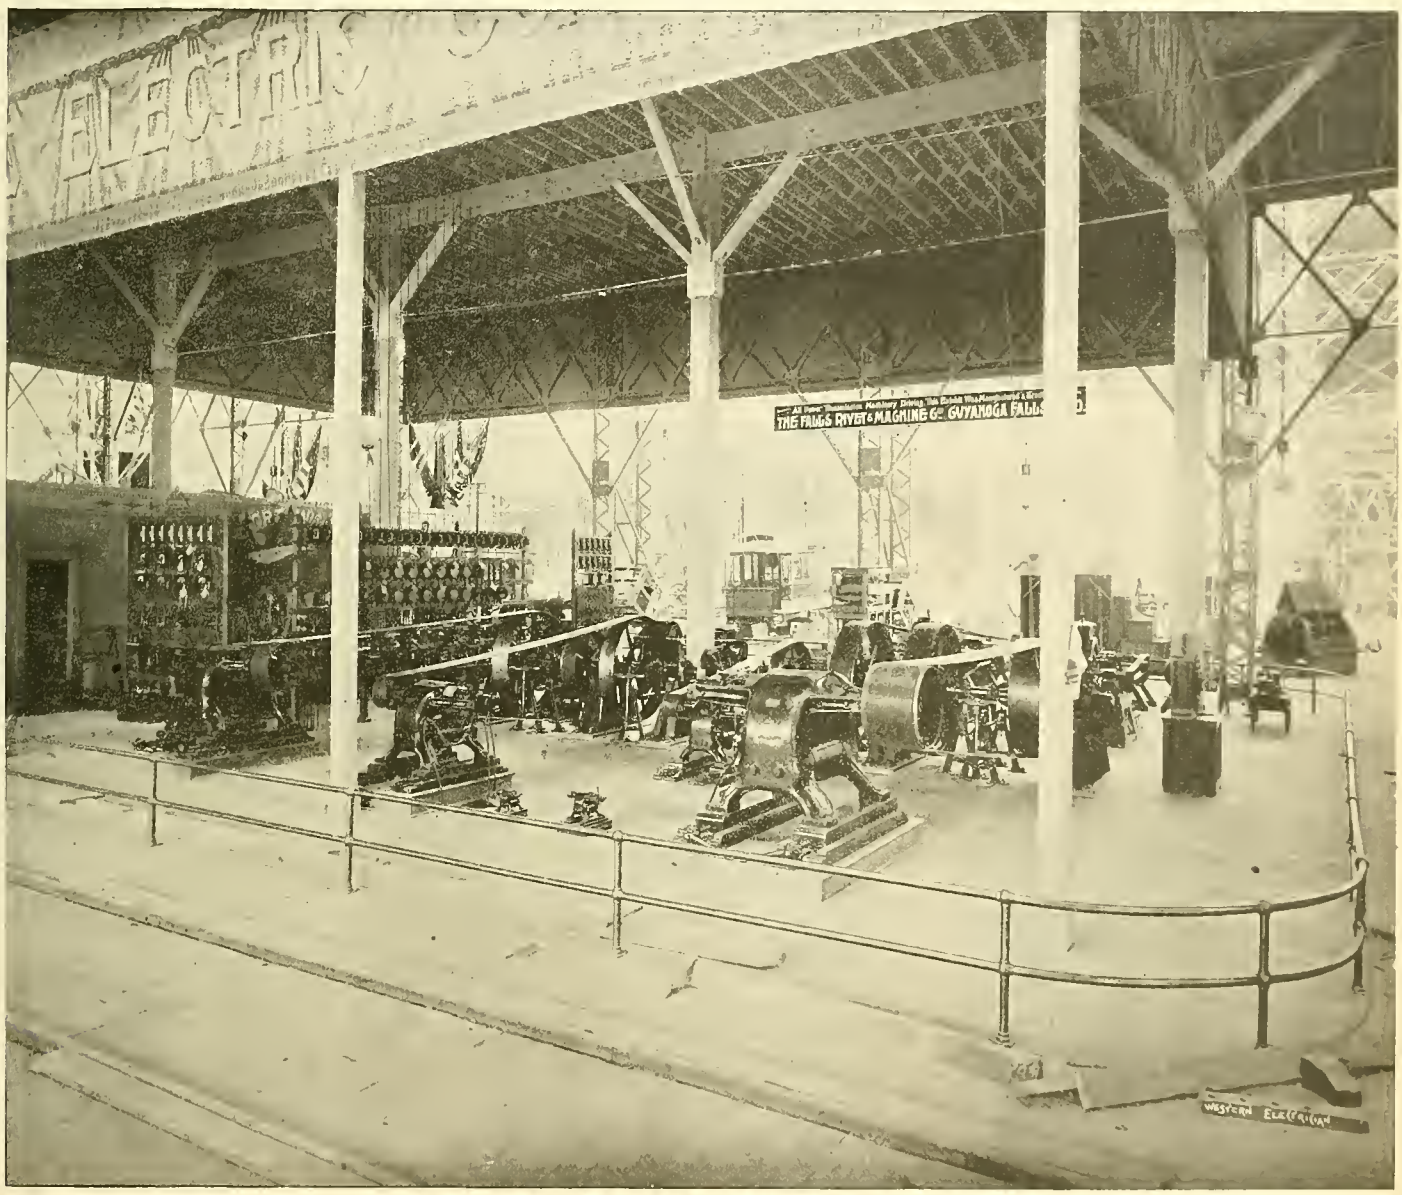

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—FORT WAYNE PLANT, ELECTRICITY BUILDING.

ago, it contains all the essential features of the most modern dynamos. The armature is iron-clad, the field magnets are multipolar and cast in one piece, and the internal resistance, measured from binding post to binding post, is but one ohm. It gives ten amperes of current and 50 volts pressure at 1,700 revolutions per minute. The total weight is 86 pounds. The commutator is interlocking and can be connected to produce the different varieties of current enumerated. The dynamo can also be used to run three independent circuits. As shown in electricity building the sturdy little machine operates a direct current arc lamp, shown in the illustration, to the wonder and delight of spectators. This historic dynamo is well and compactly built and does not differ greatly from the alternators of the present day. It is worthy of a visit from all interested in the progress of electricity. The plant includes three switchboards—one for the power circuits, another used as a distributing board for incandescent circuits, and an arc switchboard. The second is the most interesting. It is a skeleton framework of ash, arranged for both direct and alternating current circuits, and is susceptible of 12 combinations. Beyond the switchboards is a rack containing 26 varieties of arc lamps. Taken altogether, the exhibit is valuable and instructive. It reflects much credit on E. A. Barnes, the gentleman who designed and installed it and who is now in charge.

Chief Barrett of the department of electricity has issued an order giving notice of the promotion of J. W. Blaisdell to the position of general superintendent of the department of electricity, ranking next to himself and Assistant Chief Hornsby. Mr. Blaisdell is an affable and accomplished gentleman, and his friends will rejoice in his advancement.

The office of the operating staff of the exposition electrical service plant has been located in the southwestern corner of machinery hall, near the center of the plant and adjacent to the block of Standard arc machines. This department is under the direction of the following named officers: Superintendent of operation, J. H. R. Ward; assistant superintendents, H. M. Reynolds, Wynn Meredith, Sidney Sprout. When the plant is in complete running order about two hundred dynamo tenders, oilers, trimmers and "trouble men" will be employed.

The meager display made by England in the electrical department, taking up something less than 400 square feet, is generally deplored, although the English have no one but themselves to blame, as is recognized by the special correspondent of the London *Daily News*, who says: "We come out poorly in the superb department of electricity. The Germans, who have been pouring out money like water, are masters of the situation, apparently, here. An eminent American electrician in Chicago became (for an American gentleman who has been a soldier) quite emotional as he deplored to me the fact. He lamented the absence of the chairman of the committee, Mr. Preece, at the opening, and thought England ought to be better represented by electrical exhibitors. The fact is we sing small in this department, and perhaps it is useless to inquire why. The explanation, if wanted, must be sought for at home, for Sir Henry Wood and others did all they could to produce a better result."

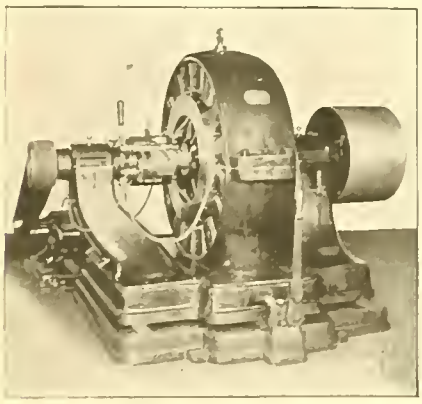

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.—NEW WOOD ALTERNATOR, ELECTRICITY BUILDING.

The American Society of Civil Engineers has appointed a committee consisting of Edward P. North, L. L. Buck and Foster Crowell to entertain and enlighten foreign engineers visiting this country to see the World's Fair and passing through New York. Among other societies the British Institution of Electrical Engineers has been invited to share the civil engineers' hospitality at their club house, 127 East Twenty-third street, New York.

Of great popular interest will be the large display of phonographs and phonographic appliances shown by the North American Phonograph company in the southwestern corner of the gallery of electricity building, a view of which is given in Fig 4. A particular effort is made to show the commercial possibilities of the phonograph. One section is devoted to an exploitation of the machine for use in business offices in connection with the typewriter in answering letters, thus doing away with stenographers. The communication is spoken into the phonograph at the convenience of the proprietor or manager, and the cylinders are then laid aside for the young ladies manipulating the typewriters, whose phonographs are geared to a speed admitting of the transcription of the letter on the typewriter without interruption. In another space is shown the use of the machine for educational purposes in class work, as now conducted in some of the large schools, and also for the purposes of teaching languages, for which it is especially adapted. The pleasure and profit to be obtained by the employment of the phonograph in the home is also demonstrated. Phonographs of all descriptions are displayed, from the original tin-foil type to the present perfected machine. The very first phonograph ever constructed, however, is not shown, as that machine is in the possession of the Kensington Museum, in London, which would not allow it removed. A large picture of this interesting relic has been secured for the exhibit, however, and from it the illustration presented in this issue, Fig. 5, has been reproduced. The display is essentially an Edison one, and pictures of the great inventor form a prominent part of the handsome decorations. A number of attractive young ladies, who are thoroughly up on the intricacies of the instrument, add greatly to the enjoyment of visitors. The exhibit is in charge of P. R. Lombard, who hopes to add to his attractions at a later date Edison's late invention, the kinetograph, and an authentic phonographic message from the pope. A number of coin-controlled phonographs for the entertainment of the public are provided in the northeastern bay, on the ground floor of the building.

THE WESTERN ELECTRICIAN

LAKESIDE BUILDING CHICAGO

6 ELECTRICITY AT THE WORLD'S FAIR.—SPECIMEN OF CABLE TELEGRAPHY, ELECTRICITY BUILDING. FIG. 6.

Another display that excites much attention from the average visitor is that of the Commercial Cable company at the center of the western gallery of the electricity building. Nine-tenths of the people have but the vaguest idea of the manner in which telegraphic messages are transmitted under the sea between America and Europe. A visit to this exhibit clears up the mystery, however, for all of the cable company's operations are illustrated by models or actual demonstration. The most interesting feature is the improved siphon recorder, developed by Charles Cuttriss, which is the machine employed by this company for transmitting and receiving messages. In this instrument the principal parts are a light rectangular coil of silk covered wire and a powerful magnet. The coil is suspended between the poles of the magnet, and when excited by the electric current from the cable, swings on a vertical axis. Its movements are recorded on a paper ribbon drawn at a uniform speed before the point of a fine glass siphon no thicker than a human hair, which conducts a stream of ink from a reservoir to the paper ribbon. The marking end of the siphon responds to and multiplies every movement of the coil, and leaves on the ribbon an inky trail, which is an exact and permanent record of the movements of the coil under the influence of the currents from the cable. The coil is pivoted in jewels, and its motion controlled by magnetism so applied as to take the weight of the coil off the pivot and hold the coil almost suspended in the air, thereby securing the maximum freedom of motion and of control. This method of controlling recorder coils renders them so delicate that a speed of 250 to 300 letters per minute is maintained. Visitors are presented souvenirs in the shape of messages transmitted through the siphon recorder, with the characters indicated by ordinary Roman letters underneath. Those who are not familiar with cable telegraphy will be interested in the sample "inky trail" of the recorder presented in Fig. 6. The exhibit, which is in charge of H. F. Harrington and E. Desnoyée, contains many other interesting features, and is well worth a visit.

Chief Barrett has written a circular letter to exhibitors, requesting them to note any errors that may have crept into the first edition of the catalogue, in order that the list may be correct in the forthcoming edition.

The Ansonia Electric company has transformed the third floor of its building, at the corner of Michigan avenue and Randolph street, Chicago, into club rooms, to which it extends a cordial welcome to visiting electrical men. All the conveniences of club life will be provided. The arrangements for the carrying out of this hospitable scheme have been placed in the hands of George B. Shaw. Mr. Shaw has also charge of the exhibit made by the Ansonia Electric company, which can be found in the attractive pavilion occupying the north end of the gallery in the electricity building.

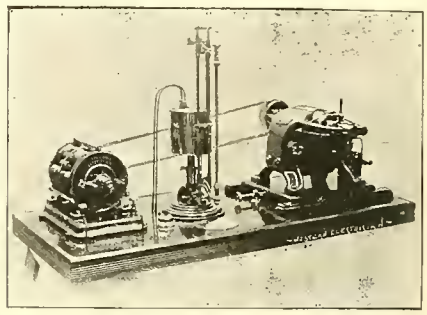

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.—HISTORIC WOOD DYNAMO, BUILT IN 1879, ELECTRICITY BUILDING.

On Thursday evening a test was made of the electrical fountains, and the results were such as to warrant the prophecy that, when fully completed, the fountains will surpass anything of the kind ever attempted. The principal cause of delay now is in the pumps and hydraulic arrangements.

The most noted visitor at the Bell telephone pavilion last week was Prince Roland Bonaparte. The distinguished Frenchman was entertained by General Manager Hovey. He expressed great interest in the very complete telephonic display, particularly in the tests of the long-distance instruments.

Among the late exhibitors is the General Incandescent Arc Light company, which has space in the northeastern portion of electricity building, on the ground floor. An elaborate display of novel arc lamps is promised by Charles A. Noll, the general agent of the company.

Many of the most attractive and novel exhibits in electricity building are in the gallery, and visitors who neglect to ascend the stairs will miss some of the most striking novelties. The phonograph, kinetograph, telautograph, deep sea cables, electrical engraving machines, foreign telegraph displays and rare instruments are nearly all in the gallery. And who will care to go away without at least a peep at the headquarters of the paper that prints all the electrical news at the World's Fair, the WESTERN ELECTRICIAN? This attraction, too, is in the gallery in the northwestern portion of the building. The official designation of the space is Y-32. Don't forget the number.

Arrangements have been perfected for the operation of an electrically operated time-ball on a flagstaff surmounting the dome of the government building. It will drop precisely at 11 o'clock every morning, when it is noon at the Naval Observatory in Washington, from which the time is sent over Western Union wires.

A very successful evening illumination was given last Saturday. The attendance was larger than at any other time since the opening of the exposition, and the scheme of electric lighting was the most elaborate yet attempted. The northern electric fountain was running, but as the arrangements are not completed, little idea could be given of the effects that will be ultimately attained.

World's Congress of Electricians.

The following important announcement has been made by Prof. Elisha Gray, chairman of the World's Electrical Congress committee:

We have the pleasure to announce that in accordance with the expressed wish of the American branch of the advisory council of the World's Congress of Electricians, the secretary of state has appointed Profs. H. A. Rowland, Johns Hopkins University; T. C. Mendenhall, superintendent standard weights and measures; H. S. Carhart, Michigan University; Elihu Thomson, Lynn, Mass., and E. S. Nichols, Cornell University, to sit in the chamber of delegates as the duly authorized United States delegates.

While there are many electricians in the United States who could fill with dignity and credit to the profession

this honorable and responsible position, yet the profession is to be specially congratulated that the United States is to be represented by men of such high standing, both as gentlemen and members of the profession.

We also have the pleasure to announce that the Royal Commission has named W. H. Preece, Prof. S. P. Thompson, Prof. W. E. Ayrton, Major Cardew and Alexander Siemens as delegates from Great Britian.

There is every reason to believe that the success of the congress is now assured, and that all the important countries will be fairly represented.

The following self-explanatory telegram was received by Prof. Gray last week from Prof. Edwin J. Houston, the newly elected president of the American Institute of Electrical Engineers:

The American Institute of Electrical Engineers at its annual dinner assembly wishes to convey to you its desire for the success of the Electrical Congress and its intentions to lend all its energies towards that end.

Annual Meeting of the American Institute of Electrical Engineers.

The annual meeting of the American Institute of Electrical Engineers for the reception of the yearly reports, the election of officers and other business proceedings was held at the headquarters of the Institute, No. 12 West Thirty-first street, New York, at 4 P. M., Tuesday, May 16th. President Frank J. Sprague was in the chair. The reports of the treasurer and secretary were read. The finances of the association were shown to be in a healthy condition, there being a balance of several hundred dollars in hand. The membership of the Institute is now close on 700, as the secretary's report showed 673 on the list and 22 new members were elected at the council meeting. There is now such a demand for admission that the Institute hopes to attain a membership of 1,000 before it completes its tenth year.

The distribution of the official ballots by the secretary was followed by the distribution of what was announced as a "members' ticket," accompanied by a circular signed by about thirty members. By enclosing a stamped envelope, votes were no doubt secured from many who otherwise would have neglected their privilege. Out of a membership of 673 returns were received from 466, and of these 427 were counted, the remainder being thrown out for various defects. T. C. Martin and George A. Hamilton were appointed tellers and devoted several hours to their duty of counting, and the final result was announced as follows. President, Edwin J. Houston; vice-presidents, H. Ward Leonard, P. B. Delaney, William Wallace; managers, Charles Hewitt, William J. Hammer, Harris J. Ryan, J. J. Carty; treasurer, George M. Phelps. Under the new rule the secretary is elected by the council.

The vice-presidents whose terms expire in 1894 are: A. E. Kennelly, Nikola Tesla and Oscar T. Crosby; managers, Dr. Louis Bell, Herbert Laws Webb, Prof. Alfred G. Compton and James Hamblet. The managers whose terms of office expire in 1895 are Charles Wirt, Augus S. Hibbard, Dr. Michael I. Pupin and Charles P. Steinmetz.

During the counting of the ballots an extended discussion took place upon the question of holding regular meetings in other cities. It was brought up by Dr. Perrine, who is about to locate on the Pacific Coast, and who desired to ascertain what steps could be taken toward calling such meetings. The discussion was entirely informal, but elicited the fact that there was no objection to such a plan provided a sufficient number of members could be assembled to make the practice a success. Upon the reading of a preliminary report by the tellers announcing the vote for president as 236 for E. J. Houston and 145 for Thomas D. Lockwood, the meeting adjourned and the members reassembled at "The Arena," where about 75 sat down to the annual dinner. Professor Houston presided and appointed Past-president Sprague as toastmaster. Appropriate remarks were made by Messrs. Lockwood, Emery and Martin.

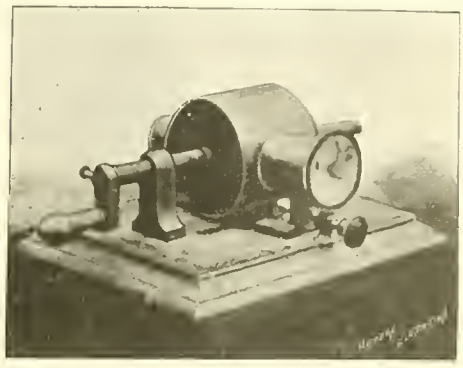

FIG. 5. ELECTRICITY AT WORLD'S FAIR.—EDISON'S FIRST PHONOGRAPH.

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—PHONOGRAPHIC EXHIBIT, ELECTRICITY BUILDING.

The general meeting assembled at headquarters on Wednesday morning, and papers were presented as follows:

'On the Behavior of Fuse Metals in Direct and Alternate Current Circuits," by Charles P. Matthews, of Cornell University, Ithaca, N. Y.

"A Modified Deprez D'Arsonval Galvanometer," by Lieut. Charles D. Parkhurst, of Watervliet Arsenal, West Troy, N. Y.

"The Variation in Economy of the Steam Engine due to Variation in Load," by Prof. R. C. Carpenter, of Cornell University, Ithaca, N. Y.

"An Automatic Printing Speed Counter for Dynamo Shafting," by Prof. Geo. S. Moler, of Cornell University, Ithaca, N. Y.

After luncheon the following papers were read.

"A New Method and Apparatus for Measuring Conductivity," by E. G. Willyoung, of Philadelphia.

"The Heating of Armatures," by A. H. and C. E. Timmerman, of Cornell University, Ithaca, N. Y.

A. E. Kennelly then opened the discussion on the Provisional programme for the World's Electrical Congress, which was participated in by Messrs. Houston, Lockwood and Pope.

In order to avail himself of suitable apparatus, Dr. Pupin invited the members to meet in Prof. Chandler's room in Columbia College at 4 P. M., where he lectured on the "Practical Aspects of Electrical Resonance." The lecture was well received and the author was highly complimented upon his researches by Mr. Tesla who was present. The meeting then adjourned.

In the evening, on the invitation of the New York Electrical society, the members attended the lecture at Columbia College on "A Brief Glance at Electricity in Medicine," by Dr. W. J. Morton, in which some novel effects were shown to illustrate some possibilities at present but little known of the influence machine in electrotherapy. The lecture will be incorporated in the minutes of the Institute.

Friday afternoon was devoted by the electrical engineers to a visit to the Crocker-Wheeler new factory at Ampere, N. J., whither they were taken by a special train, and they were greatly interested in the equipment of machine tools with electric motors, whereby the necessity of belting and shafting is entirely avoided. The system was well shown in the machine shop where, in place of the ordinary shafting, a line of half inch bare copper rods twenty feet in length, and held in position by a special porcelain insulator runs the whole length of the shop. The rods are joined together by sleeve couplings and soldered, the pine board which carries them being fixed to the roof beams. The arrangements for taking off the current are perfect.

This visit brought to a close what has been a most successful meeting of the Institute. Its general programme was purposely made much less elaborate than usual, in view of the fact of the near approach of the Electrical Congress, and a great deal of the work was made to bear on matters the discussion of which will be resumed at Chicago in August. All the officers of the Institute are anxious that the Electrical Congress shall be a great success, and are bending every effort in that direction.

The committee on invitations to the congress availed itself of the fact that most of its members were in town to hold its latest meeting, and transacted a large amount of work, the results of which will be published in a week or two.

Distributing Niagara's Power.

Attention was directed in the last issue of the WESTERN ELECTRICIAN to the formation of a company for the electrical distribution throughout New York of power generated at Niagara Falls. Concerning the plan to compete with the local company at Rochester, which utilizes the water power of the Genesee River, the *Herald* of that city says:

Rochester capitalists interested in the organization of the Cataract Electric company, which proposes to bring electricity from Niagara Falls to this city and farm it out to manufacturers, and in fact to all who have any need for the fluid, do not seem at all disposed to talk just at present about their plans. A *Herald* reporter learned yesterday that the company had not yet been actually formed but that its projectors are sanguine of success and hope to file incorporation papers in the near future.

Men who think favorably of the enterprise are to be found on all sides. Some express a willingness to invest in the enterprise and yet are unable to say what the capital of it will be. When questioned they invariably refer their interrogator to Frank W. Hawley, of Pittsford, who undoubtedly is the prime mover in the scheme, but Mr. Hawley is hard to find, as he spends the greater part of his time in New York.

Henry C. Brewster, of the Traders' Bank, is another of the interested ones. While Mr. Brewster professes no great knowledge of electricity he thinks the scheme a practicable one, and under certain circumstances would put money into it. What these circumstances are and how heavily he would be likely to invest Mr. Brewster refuses to say. Within two weeks he thinks the organization of the company may be made public, but he would give no positive statement of facts.

Secretary Moss, of the Chamber of Commerce, knows none of the interested persons, but thinks the scheme capable of accomplishment. As evidence that electric power can be transmitted from Niagara Falls to this city he cites the mode of supplying Frankfort, Germany. The plant is located at Lauffen Falls, 100 miles distant, and supplies Frankfort with both light and power. As to the expense, compared with steam power, Mr. Moss was unable to speak.

Mr. Moss' opinion is at variance with that of the superintendent of the Rochester Electric Light company, 70 Mumford street. Quite naturally, he is not over enthusiastic concerning the scheme's success. He thinks the plan as yet impracticable, inasmuch as no cable has yet been constructed capable of carrying so great a voltage. He was in Buffalo Friday and talked with a gentleman controlling large manufacturing interests in that city as to the feasibility of using Niagara Falls electricity as motive power in

Buffalo. The manufacturer stated that at the prices announced, even should the scheme proved successful, it would be more expensive than steam, and he would continue using the latter.

City Surveyor McClintock was seen at his office in the City Hall. He said he was not in a position to make a statement concerning the matter, as his information in relation to the project was derived wholly from the newspaper reports. If practicable he thought the product would likely find a market here notwithstanding the water storage project. The competition thus created would be of great benefit to the city, and the city's growth in his opinion demands more power. He wishes the enterprise to succeed, but first looks for the acceptance of Niagara's force as a motive power by the manufacturers of Buffalo.

Concerning the Frankfort Lauffen experiments it may be said that the opinion entertained by many persons outside of the electrical fraternity corresponds with that expressed by Secretary Moss of the Rochester Chamber of Commerce. They do not realize that the experiments there made were not successful from a commercial point. It is to be hoped that the projectors of the enterprise have something more promising than the German experiments upon which to base their expectations.

Electricity in a Welsh Mine.

The first electric haulage plant in South Wales has recently been installed in the Abercanaid pit of the Plymouth company at Merthyr Fydfil. The installation was made for the purpose of hauling 500 tons a day, and as the mechanical power will replace 27 horses and as many men, the plant has attracted a very large share of attention in the Welsh coal mining districts, where economy in working is a matter of prime importance. The power station, which is shown in Fig. 1, is 61 feet in length, 32 feet in width, and 36 feet in height. It contains a 40 horse power compound engine, made by Marshall & Co. of Gainsborough, which by means of a fly wheel drives a Compton dynamo, the output of which is 180 amperes at 500 volts. Current is conducted down the shaft along the workings to a point three-fourths of a mile distant, where there is situated a hauling engine, Fig. 2, which is fitted with two drums, each of which is provided with a clutch and foot brake. The drum shaft is driven by spur gearing from a countershaft on which is a rope wheel grooved for six ropes of one inch in diameter. These ropes pass around a smaller pulley on a series wound Crompton electric motor which is operated by a current of 80 amperes at 450 volts.

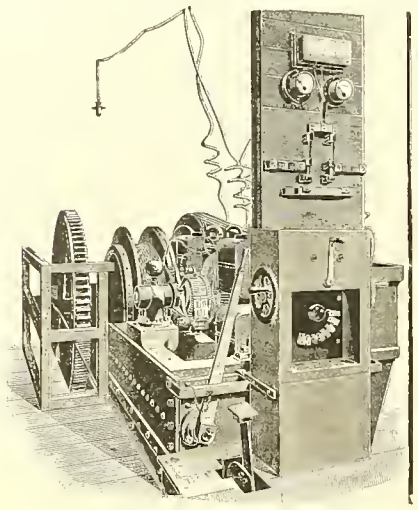

FIG. 2. ELECTRICITY IN A WELSH MINE.

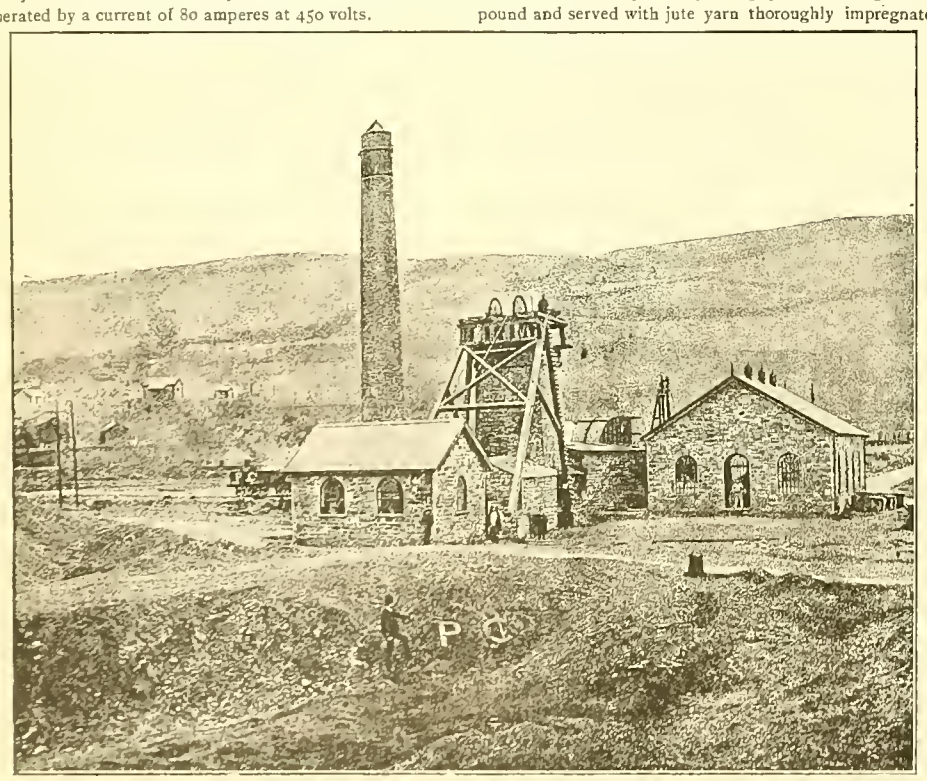

FIG. 1. ELECTRICITY IN A WELSH MINE.

It is governed by a Howell-Powsall switch, arranged to deal with currents of great pressure and magnitude without injurious sparking. The motor is mounted on the end of a wrought-iron frame, which forms a bed for the drum and spur gear. This plant will haul coal from three different parts of the pit, and although these are not far from the moter at the present time, it is expected that eventually coal will have to be dealt with from nearly a mile distant.

The Abercanaid pit is fortunate in being quite free from gas, so that no precautions have to be taken to prevent sparking at the commutator and switch. It is, however, liable to falls of roof and other accidents that might damage the conductor, if not efficiently guarded against. A very heavily armoured cable has, therefore, been laid down, of a length of 3,200 yards. It is carried down attached to the side of the shaft, and from the shaft to the hauling engines it is run underground along the roadway.

The conductor of the cable consists of 37 wires, each No. 14 S. W. G. of tinned copper, of 98 per cent. conductivity. The section of conductor is therefore .191 square inch. This strand is insulated by means of a solid sheath of vulcanized bitumen, put on in one operation under heavy pressure. This is protected by two layers of bitumenized tape, compounded, and over this a bedding of jute yarn is formed by two heavy servings, well dressed with preservative compound. On this are wound the two layers of steel wires which form the armor. The first consists of 24 wires, each .160 inch (No. 8 S. W. G.), laid right-handed; the second is of 30 wires of similar size, laid up left handed. This was supplied by Callender's Bitumen Telegraph & Waterproof company, London.

The cable is completed by being passed through compound and served with jute yarn thoroughly impregnated with Stockholm tar, and then dressed with asphalt compound. The diameter of the cable is 2 15 inches. It was made in lengths of 150 yards, each weighing, without the drum, about 3,000 pounds. Owing to the difficulty in handling the cable in the limited space available, it was not considered prudent to supply it in longer lengths. Each length was finished by a copper end-piece, which was sweated on to the conductor before being laid, and these end-pieces were subsequently bolted together and protected by strong cast iron boxes, which boxes were run in solid by insulating material. Any length can be disconnected for testing at a few minutes' notice, and reconnected without requiring any joining or soldering. In addition to the haulage plant, electric lighting is effected from the power station. There are 100 incandescent lamps of 16, 32 and 50 candle power, distributed about the engine house, pithank, screens, and various other positions on the surface. There are also twenty-five 32 candle power lamps distributed over 1¼ miles of village streets, and 100 16 candle power lamps fixed in various positions underground, along the main roadways, in the stables, etc. Figs. 3 and 4 were photographed by aid of electric lights, the latter being the pit bottom in the South Duffryn Colliery, and the former the underground engine plane at Abercanaid Colliery. The plane is worked with endless rope haulage, and as shown, is temporarily obstructed by the cables used in the electric lighting. The cuts are reproduced from London *Engineering*.

American Institute Badge.

The American Institute of Electrical Engineers has adopted an official badge, the design of which was selected by a committee composed of Dr. F. Benedict Herzog, Horatio A. Foster and William J. Hammer. It is neat and appropriate, and embraces the following characteristic features:

Franklin's kite, which demonstrated the identity between lightning and electricity, and represents static electricity. It is a recognition of America's first electriciana nd philosopher, Benjamin Franklin.

A diagramatic representation of Wheatstone's bridge, one of the most important pieces of electrical testing apparatus.

The galvanometer, another equally important piece of testing apparatus and which represents magnetism and induction.

The amber, of which the galvanometer is made, represents the first conception of electricity dating back to 600 years B. C., when Thales, the Greek philosopher, recorded the fact that amber, when rubbed, attracted light particles to it, and the Greeks worshipped it, believing the gods had endowed it with life and that it possessed a soul. In 1600 A. D. Dr. Gilbert, court physician to Queen Elizabeth, coined the word electricity from the word elektron, the Greek name for amber.

A. I. E. E. represents the initials of the American Institute of Electrical Engineers.

$C=\frac{E}{R}$ represents Ohm's law—a fundamental law in electrical work.

The pin is made of white enamel with the lettering and front portions in 18 karat gold and the back in 14 karat gold. The secretary, Ralph W. Pope, announces that the badges are now ready for distribution and can be procured by members.

Electricity in Medicine.

A remarkable lecture was given at Columbia College before the New York Electrical Society on the 17th inst. The subject was "A Brief Glance at Electricity in Medicine," and the lecturer was Dr. W. J. Morton, professor of diseases of the mind and nervous diseases and electrotherapeutics at the post graduate school and hospital, New York. Dr. Morton's standing as an expert in these branches in this country corresponds to that of D'Arsonval in France, and, as might be expected from the eminence of his reputation, the lecture brought together a most appreciative audience, in which were found some of the foremost medical and electro-therapeutic practitioners of the city. The subject was treated under the following heads: The Various Currents used in Medicine; The Properties and Applications of the Respective Currents; High Frequency; High Potential Currents; Electrostatics of Franklinism Tesla Currents, from Alternators, Air-gap, Condenser and Induction Coil; Morton Currents, from Influence Machine, Air-gap and Condensers; D'Arsonval Currents; Sinusoidal Currents, from Alternating Dynamo Machines.

Premising that the pursuit of truth was to electricians, who dealt with electricity applied to inanimate objects, a far less onerous task than that undertaken by electro therapeutists, who, outside of the necessity of a thorough technical equipment in the physics of electricity, were confronted with the perplexing problem of the laws which govern life in animate objects—the problem of biology—Dr. Morton described the effects of the electric current according to the divisions into which it has been classified for medical use, viz.: Galvanism, Faradism and Franklinism. An investigation then followed into the nature of the gross substance, the human body, to which the current had to be applied and the reactions of electricity upon it, and an examination was made of the principles, the instruments and the method of application, the knowledge of which constitutes the science of electro therapeutics. The physical properties of the current were classified into heat, light, magnetic, induction, chemical, electrolytic and cataphoric, and the physiological properties into contraction of proto-

plasm, excitation of nerve and muscle and electrotonus. In using electricity to cure disease, the physician was compared to a huntsman, who has a certain number of arrows in his quiver, each adapted to different purposes. He selects an arrow—a property of the current—and projects it against a disease or morbid condition. "At least," said the lecturer, "that is what he should do; but it is unfortunately a fact that physicians are wofully ignorant about

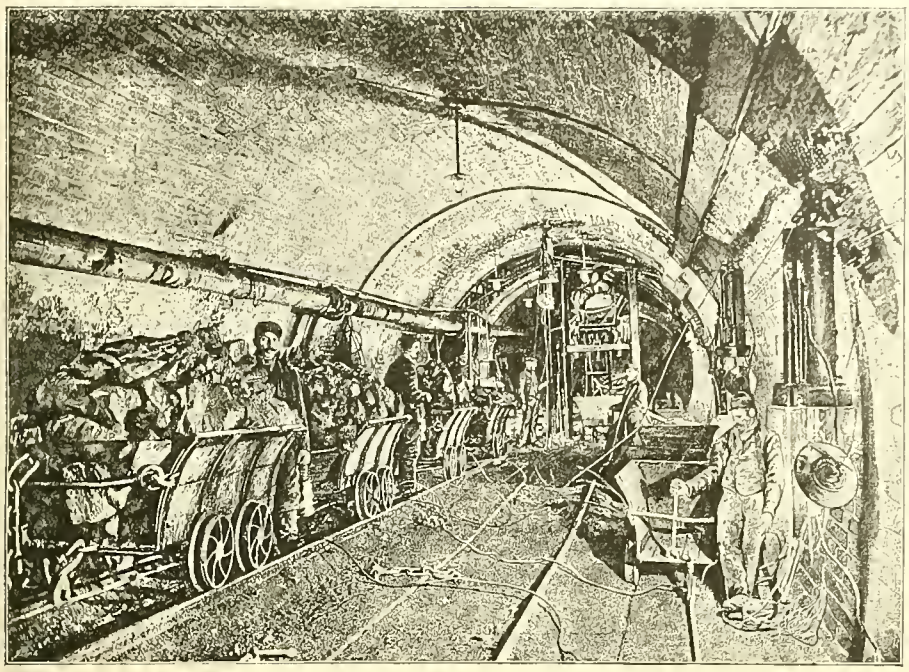

FIG. 3. ELECTRICITY IN A WELSH MINE.

what electricity will do upon inanimate and still more so upon animate matter. The general impression seems to be that electricity is to be injected into a human being by a small sponge electrode, much as one would inject a medicated fluid in through the skin by a hypodermic needle, and it is then to run about the system, hunt up the diseased spot, make a diagnosis, and chase out the disease, much as a ferret might run a rat out of a hole."

In detailing the electrical discoveries which have been silently working a revolution in various branches of medical practice, the lecturer said that some recent advances in the application of electrolysis are of great value and deserve to be better known. One of these, termed metallic electrolysis of soluble metals, has been taken up by Gautier of Paris, and developed into a curative system which has before it a brilliant future. An iron needle connected to the positive pole, plunged into human tissue, is quickly attacked by the oxygen and chlorine set free at this pole. It is converted into oxychloride of iron, a double salt, and is soon completely destroyed. The same is true of any metal attacked by oxygen or chlorine. A copper needle or bulb is converted into oxychloride of copper, zinc into oxychloride of zinc, and so on. The general effect of this treatment is antisepetic and healing, and it is of immense benefit in gynaecological work, in unhealthy ulcerations, tumors and dischargiog cavities. But the direction in which it will most probably appeal to the general public is its marvelous results when applied to catarrh. The results that are already on record would induce the belief that almost any case of catarrh will yield to this treatment in the hands of a skillful practitioner, and in its speedy effects it presents a very agreeable contrast to the tediousness of conventional treatment. Next to electrolysis, cataphoresis, or the flow of a liquid with the current from the positive toward the negative pole, is the most important property of the galvanic or continuous current. This cataphoric property of the current renders available a very interesting method of introducing medicine into the human body and blood stream through the skin or mucus membrane. The process is termed "cataphoric medication." In this manner iron, mercury, quinine, morphia, cocaine and a further great variety of medicines may be caused to affect the patient without entering the stomach. The practice is of great value to produce local anaesthesia by cocaine, and also in many cases, as in skin diseases, where a potent local effect of the medicine is desired. There is no good reason why a "medicated bath" should be an adjunct of quackery. If the medicated water of the bath is made the positive electrode, a patient in this bath, with hands and arms out of it, and in connection with the negative electrode, will receive by cataphoresis through the skin, a large amount of any desired medicine, and this, too, in the purest and most active state of the medicine. The reverse of this phenomenon is also of interest. It is found that by cataphoric demedication medicines like, for instance, arsenica and mercury, may be removed from the patient, and be visibly deposited upon the negative electrode, according to the usual rules of electro plating. A curious feature of electrical application is the different effect of different currents on the respective fibers of which the human body is composed. For instance, striped muscular fiber constitutes the bulk of the human body, and, while it contracts to an alternating current, it does not contract to a continuous current. On the other hand, the smooth muscular fibers which make up the heart, the uterus, and other important organs, and exist in the intestinal walls, contract powerfully to a continuous current, but are not so readily affected by an alternating current. This distinction leads to a very important differentiation in electro-therapeutics, and one which is scarcely yet recognized in practice. An illustration of this is afforded in cases of occlusion and paralysis of the bowels, in which intestinal movements will be best set up by a continuous current, which would not cause a contraction of the biceps or other muscle composed of striped muscular fiber. This law of electrical selection is also displayed to a marked extent in electro-diagnosis. Where muscle degeneration is suspected, if the faradic or induced current is turned on, it will be found that the muscle, if degenerated, has lost in a greater or less degree its power of contracting, simply because in its changed condition no single electric impulse lasts long enough to affect it. If the galvanic or continuous current is turned on, the muscle contracts to single impulses, because they last longer; but the singular fact is brought out that, whereas in the healthy muscle the negative pole causes the greatest contraction, in the diseased muscle the maximum contraction is caused by the positive pole. This law, which is called the Reaction of Degeneration of Erb, is the physician's great reliance for prognosis or diagnosis in many most serious diseases of the nervous and muscular systems. No general fact associated with the administration of electricity is more familiar than that the general health—the nutritional processes—are promptly and greatly improved. The exchanges between the blood and the tissues are augmented, the patient absorbs more oxygen and excretes more carbonic acid and urea, and he gains in weight and comfort. Dr. Morton pointed out the enormous power, in these and many other ways, possessed by electricity over some of the functions of the living tissue. In fact, as he put it, the trouble is, not that electricity does so little in our human bodies, but that it does so much, and in utilizing it in the interweavings of tissue the electro-therapeutist pauses, bewildered with the problems of biology and the processes of disease. In discussing the physiological effects of the Tesla, Morton and D'Arsonval currents, the lecturer spoke of the static induced current which he introduced into medical work in this country in 1881, and which has since borne his name. Of the capabilities of this current, some interesting illustrations were given by means of the influence machine. Dr. Morton concluded what will be a memorable lecture in the history of the New York Electrical society by asking electricians to join hands with the medical profession in turning electricity to the amelioration of the ills and sufferings of humanity.

Projected African Telegraph Line.

Capital to the extent of $700,000 has been subscribed for building the telegraph line from the Cape of Good Hope, Africa, to Cairo, Egypt, which is considered sufficient to carry the line as far as Uganda. The materials are now being ordered in London, and will be shipped shortly. The poles are to be of iron of light construction, in order to outmanœuvre the white ants, which would eat away wooden poles. From Fort Salisbury the line is to be carried to Tete, on the Zambesi, and from thence to Balantyre. There Consul Johnston will report the result of his surveys as to the best manner of proceeding on to Uganda, and the constructing party will have to come to terms with the natives and Arabs by subsidizing the chiefs and others of influence. There are two alternative routes for the conveyance of the materials. There is good transport from the Transvaal to Fort Salisbury, or a shorter route would be adopted if materials were shipped direct to Bejra, carried along the railway now being built as far as it extends, and then conveyed the rest of the distance by ox-wagons. The scheme is being pushed forward with great activity.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

THAT was a queer application of electricity shown in Ottawa, Ont., a few months ago, when electricity generated by water power was used to produce steam in an electrically heated boiler, the steam thus generated being utilized in driving an engine. This is on a par with the transmission scheme at the World's Fair where water is taken from a tank by an electric pump and forced through a pipe to operate a water wheel, which in turn drives a dynamo to generate electricity of another phase. Neither of these demonstrations are designed to illustrate commercial possibilities, but both show the wonderful adaptability of electricity.

ANNOUNCEMENT is made this week of the appointment of the governmental delegates to the World's Congress of Electricians. The selection of Profs. Rowland, Mendenhall, Carhart, Thomson and Nichols to represent this country will be generally approved by the fraternity. They are men of reputation in the profession, and no doubt they will reflect credit upon this country by their contributions to the congress. It is also announced that W. H. Preece, Profs. S. P. Thompson and W. E. Ayrton, Major Cardew and Alexander Siemens have been named as representatives of Great Britain. These gentlemen are well known by reputation at least in this country and they will be heartily welcomed by American engineers.

THERE is certainly a divison of public sentiment on the question of opening the World's Fair on Sunday; everybody is in favor of evening opening. The exposition has not yet been opened to the public on the first day of the week, but several evening sessions have been given, and have proved very successful. Why, then, now that the electric lighting plant is so near completion, do not the directors at once abrogate the present clumsy evening closing rule and declare in favor of an open fair every evening? This step would be at once sensible and popular. The evening and Sunday opening questions are entirely distinct, and should not be confounded by any managerial juggling.

ATTENTION is called to the WESTERN ELECTRICIAN headquarters at the World's Fair, the address of which is published at the head of this page. To those unacquainted with the division of space in the electricity building it may be explained that "Y–32" indicates a space in the northwestern portion of the gallery of the building, on the aisle overlooking, from the east, the light well in that portion of the edifice. The diagram published in the issue of May 6th will serve to give a more exact idea of the location, although it must be observed that a change has been made since the list of exhibitors' spaces then published was prepared, by which the allottment to this journal was changed from Y–31 to Y–32. Here the friends of the WESTERN ELECTRICIAN who visit the World's Fair will always be greeted with a cordial welcome, and any information desired in relation to the electrical features of the exposition will be gladly furnished.

THE Patent Office should be above suspicion, but the revelations of the last few months have tended to weaken the faith which has generally been reposed in that department. Charges have been made against a former commissioner of patents and the attorneys of the Bell company for alleged irregular practices in connection with the issuance of several telephone patents. It is claimed that the commissioner caused certain applications to be copied for his own private use and for the Bell Telephone company. Chief Clerk Bennett of the Patent Office does not deny making the copies for ex-Commissioner Simonds. He says he was merely acting under orders and that in his position he could do nothing else but obey. The proceedings in the telephone controversy should be subjected to a thorough and critical examination. The present trouble may lead to a thorough reorganization and a much needed reform in the patent office.

NEGOTIATIONS between the rapid transit commissioners and the Manhattan Railway company of New York have been temporarily suspended. The company has refused to agree to the extension of the elevated system as proposed by the commissioners. It realizes that it is master of the situation and it evidently intends to wait for the commissioners to come to its terms. Already there are signs of uneasiness on the part of many who fear that further negotiations with the Manhattan company may be impossible. The straits to which the people are pressed is shown by the fact that many of those who have heretofore bitterly opposed the L scheme are now ready to turn over to the company at its own terms the most desirable streets and boulevards of the city. The necessity of increased means of travel between the upper and lower parts of the city is recognized. The city wants better service, and while its pressing needs may be temporarily filled by the proposed L system, it should not be expected that anything like permanent relief will be afforded.

THE election of Prof. E. J. Houston to the position of president of the American Institute of Electrical Engineers was a fitting recognition of the valuable work which that gentleman has done in the interest of electrical science. Prof. Houston's name is familiar to everybody acquainted with the development of the electrical industry in this country, although he has really had no connection with the commercial side and has been content to follow his experimental work and study at his own convenience. His excellent work in the early days of the electric light was enough to ensure his reputation and his more recent work as an author and instructer has added to his fame and given him a much greater following. During the next year the Institute hopes to add many new names to the list of members, and it has been suggested that meetings be held upon the Pacific Coast in the near future. It would certainly be gratifying to know that the electrical interests of that section had advanced sufficiently to warrant such a step. Of course a great deal of work has been done and much is in progress at the present time, while the future is bright with promise. At the present time the Institute has several members who are engaged, temporarily at least, upon the coast and they would no doubt do much toward securing new members if there were an opportunity for having a gathering occasionally.

RAILWAY telegraphers are still engaged in disputes over wages, hours of labor and other points, on many roads, and much uncertainty and uneasiness in business circles has resulted from this protracted agitation. It would appear that the organization which is supposed to represent the railway telegraphers of the country is under control of professional agitators. This organization formerly pronounced against strikes and under its conservative policy would have nothing to do with them, but the men in control to-day have departed from this course. Last week a strike was threatened at Chicago because an operator was discharged for insubordination and the cry was raised that the "order" was being attacked. The operator had been instructed to explain certain duties to a novice and he refused to obey. His discharge was followed by visits from grand chiefs and committees and a strike was threatened. It is certainly to be regretted that such an intelligent lot of men as those that compose the telegraphers of the country can be dominated by a few professional agitators, and be held up to ridicule before the world.

RECENT experiments in reducing the time of making a trip between Chicago and New York have developed the fact that with improved road beds, reduced curves and grades and improved machinery the running time can be materially lessened. Big railroad companies are taking advantage of these experiments. The cause of all this experimentiog and the willingness of railroad companies to put on faster trains is not due entirely to competition among themselves, nor any special demand by the public for these flyers. It is suggested that great strides made in the telephone business have stimulated railway men since the use of telephone for the last three or four years has somewhat cut off business travel on railways. It is possible for a board of directors, part of whom live in Philadelphia and a part in New York, to hold its meeting by telephone, and one of the courts has decided such meetings to be legal. Since the long-distance telephone system has made it possible for New York and Chicago to communicate as easily as in a personal interview it has been noticed by the railway managers that there has been some decrease in business travel between the two cities. It seemed to be necessary, therefore, for the railways to maintain themselves against this extraordinary and unexpected competition, and it is partly on account of the facilities which telephoning affords that these fast trains have been added.

IN a brief comment on the congratulatory dispatch sent by Mr. Preece, on behalf of the electrical engineers of England, to Prof. Elisha Gray on the occasion of the opening of the World's Fair, the *Electrician* of London says:

Whatever views may be held as to the utility of English firms exhibiting at Chicago, or whatever other opinions may be held about the exhibition, this expression of friendly congratulation may be taken as representing English appreciation of the energy which has carried the enterprise through, notwithstanding many adverse circumstances and a general lack of enthusiasm outside the United States.

The complimentary portion of this paragraph will be appreciated, but when our contemporary speaks of "a general lack of enthusiasm outside the United States" it evidently jumps to the conclusion that the whole world is indifferent to the exposition because it can discern no great manifestation of interest within the narrow confines of the island of Great Britain. The fact is that Germany and France have never before exhibited so much interest in an international exhibition held beyond the borders of their respective domains. In vying with each other to make the most impressive foreign exhibit, each of these countries has spent millions of dollars and they will send over many thousands of visitors. Austria-Hungary, Russia, Belgium, Holland, Italy and Spain are also creditably represented in nearly all the departments, while very extensive displays are made by Japan and New South Wales. Canada, China, Ceylon, India, Persia, Turkey, Egypt, Mexico and Brazil are all represented. In short, there is hardly a civilized or uncivilized country on the globe that is not interested, more or less, in the World's Columbian Exposition. Great Britain is not adequately represented, and this is particularly true in the department of electricity, where its small exhibit is completely overshadowed by both France and Germany. But this is no reason for asserting that there is a lack of foreign enthusiasm over the fair, which is far from the truth.

Practical Applications of Electric Heating.

As has frequently been pointed out in these columns, electric heating has occupied much more attention in Canada than in the United States, so far, at least, as its application to every-day uses are concerned. Recent advances are shown in several installations which are herewith illustrated. The first of these, Fig. 1, shows an arrangement for heating a conservatory in Ottawa. The furnace was placed in the basement, the controlling switches on the floor above, and all connected with the 50 volt lighting circuit. Three hundred feet of pipe was employed in the

FIG. 1. PRACTICAL APPLICATIONS OF ELECTRIC HEATING.

conservatory and the current absorbed was about 3 horse power. The amount charged by the local company was based upon the cost of an equal amount of power from a motor circuit. The plant has worked continuously without attention since last October. The second installation, illustrated in Fig. 2, was made in a drug store in the same city. The premises were piped throughout for hot water heating last November and the electric furnace was placed in the basement. This 50 volt furnace was constructed in five independent heaters radially connected to a common supply pipe. Each heater was independent of its neighbor, the five sections being connected in multiple both mechanically and electrically. Each section was controlled by five ten ampere switches, which were placed in a row in the store above, so that for all conditions of weather the heat could be regulated by turning off or on any of the five

FIG. 2. PRACTICAL APPLICATIONS OF ELECTRIC HEATING.

sections into which the furnace was divided. Another important consideration which suggested this design was that in the event of trouble with any of the five sections comprising the complete furnace, it could be detached by closing the valves, and the particular section which might require examination could be removed without disturbing the others. Despite the fact that last winter was unusually severe, this outfit worked without a hitch and without attention of any kind, and provided at all times the heat desired. For the usual Christmas display of the Chaudiere Electric Light company an electric upright boiler, Fig. 3, was designed which operated a one horse power engine, both the engine and boiler being placed upon a large table in the company's office. The boiler was provided with steam gauge, water glass and safety valve. Being nickel plated throughout, it presented a very handsome appearance. The safety valve was set for 35 pounds pressure, which operated the engine. As heretofore steam engines have been employed in applying the power necessary to energize dynamos, the novelty of this outfit consisted in the fact that the electricity was developed by water power, which was converted into heat making steam in the boiler, and which was then used in driving the steam engine.

In these installations the Ahearn electric heater was the type employed. The principle and details of construction of these heaters have been fully described in this journal.

Pentz-Reckenzaun Electric Meter.

In the accompanying cuts the details of the new Pentz-Reckenzaun electric meter are illustrated. James A. Pentz and Anthony Reckenzaun, the inventors, have given much attention to the elimination of faults that have hitherto been considered inherent in such meters. In this meter there are no springs, no loose hanging pendulums, no clock-work arrangements, no escapements, and owing to the force of gravity being utilized for actuating the oscillating bars, it is claimed that it is a perfect time-keeper.

The replacement of escapement spring clocks by electro-gravity synchronized pendulums, the double pendulums, metal case and slate base, and the exemption of the clocks

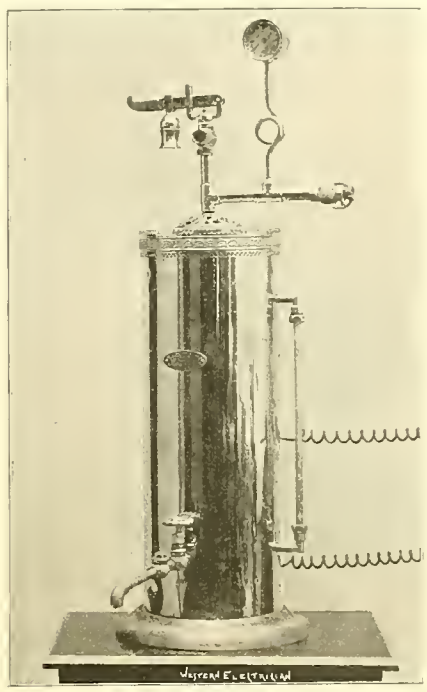

FIG 3. PRACTICAL APPLICATIONS OF ELECTRIC HEATING.

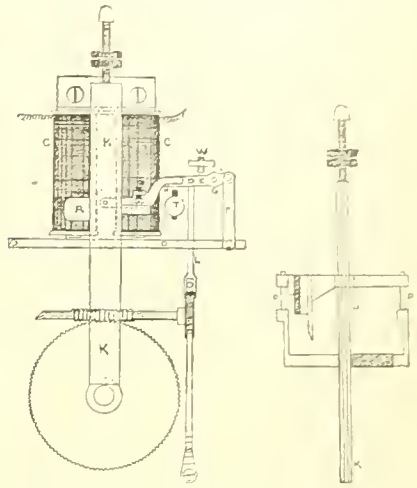
from driving any gear and reducing them to simple governors, their proper function, will rank as advances.

The new meter requires no attention in the way of winding, being driven by current taken from the supply. The cost of maintenance and driving should be small. An extremely low current is used in the driving magnets, somewhere about one-sixtieth of an ampere. The recorded value can be given directly in units. The permanent magnet meter is, of course, restricted in its employment to direct current circuits, but a similar adaptation is in view to make the meter of use for alternate current work.

The mechanism in the meter may be considered under three heads: First, the standard metronome; second, the electrically influenced pendulum and its gear; third, the recording and indicating apparatus. The electro-magnetic driving apparatus and the pendulum bar of one side of the meter are shown in Fig. 1, while the side view of the pendulum is given in Fig. 2. Fig. 3 shows the connections of the meter in a circuit, and introduces the relay which closes the driving circuit when the meter is in action. When a current circulates in the main coil owing to a demand on the consumer's premises, the magnetic needle of the relay is deflected, closing the driving circuit and starting the pendulums. As the arrangement of both pendulums is electrically similar, it will only be necessary to trace the course of the current in Fig. 1, which represents half of the mechanism, to understand the action of the meter. The bar A' is insulated from the frame, and is connected to one end of the electro-magnet coil C. The other end of the coil C is taken to the negative side of the lamp circuit, through a resistance of 5,000 ohms, and the potential terminal on the right hand side of the principal terminal, which is connected to the other side of the circuit by a small, well insulated wire. The positive side of the circuit is made through the relay to the frame of the magnets, and thereby the contact screw enables the current to flow to the pendulum bar, thence through the coils and the route described. At the moment the current is turned on, the armature D will be attracted, and consequently the pin H, on the lever K, will fall, permitting the full weight of the gravity piece J to drop upon the cross piece K, which is a lateral extension of K', and thus the latter is started into vibration. When the end of



FIGS. 1 AND 2. PENTZ RECKENZAUN ELECTRIC METER.

the gravity piece strikes the stop T, the driving circuit is broken by R, leaving the screw S; the armature D therefore, immediately falls, and in so doing resets the pin H to its first position, being limited in its upward movement by the stop screw W. On the pendulum swinging back, the cycle of operations is again repeated, and this continues so long as the relay needle is deflected by current passing through the main coil. The driving power of the metronomic system is, therefore, obtained by the force of gravity, which acts upon a definite mass free to fall a given distacce, and is, therefore, independent of the variation in driving current due to fluctuations in the voltage in the mains. The registration is effected by causing the dependent catch bar L to actuate the ratchet wheel shown on Fig. 1, so that for every complete swing of the bar K' a tooth in the wheel is moved forward and the swing registered upon the recording apparatus.

The arbor of one clock being hollow allows the arbor of

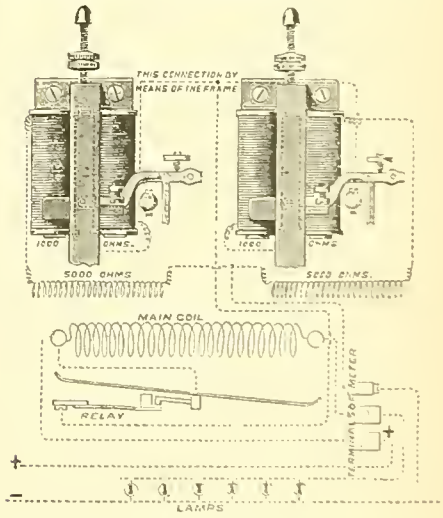


FIG. 3. PENTZ RECKENZAUN ELECTRIC METER.

the other one to be brought through it. The former carries the dials on a frame, the latter a wheel which gears into one on the frame, so that if the two axles revolve together the relative position of a pointer fixed to the wheel carried by the frame and a point on the dial itself is unaltered. When, however, one axle is given a higher rate than the other, the difference is indicated by a displacement of the pointer, and by suitable counting gear the registration of consumption is effected.

Such sparking as might occur with the small current broken periodically at S has been practically eliminated by a special compound winding of the magnet coils. The bar R and screw S are at different radii from centre of

vibration of K, so that a rubbing contact is insured in preference to merely the butt contact which might foul slightly after a period of use under practical conditions. The main coil, through which passes the current to be measured, is a solenoid of special shape and very low resistance. It is placed with its center below the point of suspension of the magnetic pendulum, whose rate of vibration it accelerates positively by virtually increasing the effect of gravity upon the bar. The relay needle underneath the main coil is deflected by less than the current required by one lamp,

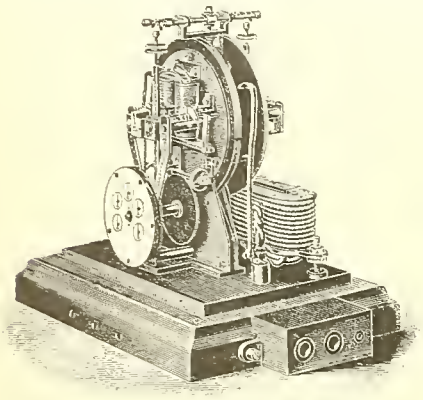

FIG. 4. PENTZ-RECKENZAUN ELECTRIC METER.

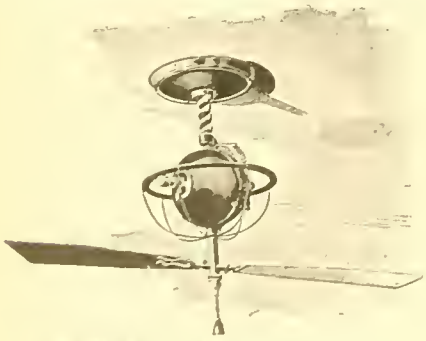
and so starts the clocks, which cease to register when the current is switched off.

The adjustments are threefold, the first and second being only attempted by the makers, while the third is open to the meter testers of supply companies. For synchroniz'ng the two bars and timing their vibratory beats two nuts are arranged on screwed extensions of the pendulums, while the fine adjustment is given by slight variation in height of contact screw S. These two means enable meters to be calibrated so as to start registering without difficulty, maintain straight line curves, and read directly in units.

If, however, the standards of makers and consumers vary, a final adjustment can be made by raising or lowering the main coil, which is mounted on screwed legs with leveling and back nuts for this purpose. There can be no tampering when the metor has been passed for service, as two covers are used, the first covering up the mechanism and being sealed by the local inspector, while the second contains the three terminals only, the access to which would be open to the central station company, but sealed by it to prevent unauthorized interference. The case of the meter is of japanned metal, fitting air-tight to the base. The parts are mounted on a slate base set within a cast metal frame for strength, while the supporting framework of the parts is utilized as magnetic shields, screening the driving gear of the clocks from one another and from the magnetic pendulum which is given every surrounding possible to ensure accuracy. These meters are manufactured by the Pentz-Reckenzaun Electric company, 1001 Chestnut street, Philadelphia, Pa.

The Lundell Ceiling Fan Motor Outfit.

The accompanying illustration shows an ingenious combination of a big two blade fan and a small compact motor. The device is so constructed as to depend from



LUNDELL CEILING FAN MOTOR OUTFIT.

any ceiling at the correct distance for the required effect. The blades of the fan are constructed of hard wood, and the pitch of them can be changed to suit requirements by loosing the screws which hold them in position and resetting them.

The method of transforming the motion of the commutator shaft of the motor into a motion at right angles to it is worked out so cleverly as to obtain an absolutely noiseless result at maximum speed. Upon one end of the motor shaft a small friction wheel is attached. Encircling the motor and resting on this wheel is a thin circular ring plate which receives its motion by friction from the small wheel. This circular ring plate is in turn connected with the fan shaft by four curved metal braces, making a solid and strong construction.

The relation of the speed of the fan to that of the motor thus becomes as one to eight. To operate this outfit only six tenths of an ampere of current is required, or about the same amount as is required for an ordinary 16 candle power lamp. The motor is the invention of Robert Lundell, and the outfit is placed on the market by the Interior Conduit & Insulation company, New York.

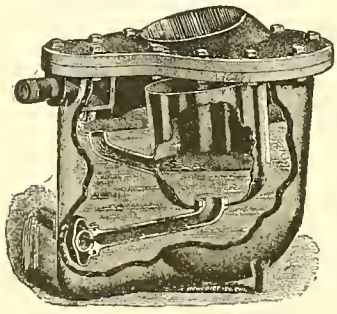
Fidelity Steam Trap.

The accompanying cut represents the Fidelity steam trap, manufactured by the Van Auken Steam Specialty company of Chicago. This trap is made especially for high pressure and heavy duty. All parts are made extra heavy, and its proportions are such that it will stand any pressure carried on steam apparatus. High pressure does not retard its operation. It is provided with an open float, to which is attached the hollow valve arm, ground to fit the outlet plug. It continues to wear its own seat and remains tight, hence it never needs grinding. Its main features are that it has no closed float to collapse or fill up or complicated valves that are liable to stick. The action is positive under all conditions, and the valve opens to such an extent that it discharges the condensation in the same volume as it enters the trap.

These traps, which are now used at the Adams street station of the Chicago Edison company, are designed to be used for draining the condensation from heating systems, steam separators, dry-kilns, evaporating pans, etc., and they are said to work on pressures as high as 150 pounds.

Elliott Car Brake.

The brake invented by G. R. Elliott of Boston, Mass., a cut of which is here presented, is the embodiment of simplicity and efficiency, and is constructed on mechanical principles unerring in their operation and positive in their results.

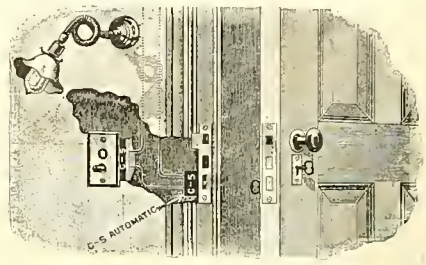


FIDELITY STEAM TRAP.

A chilled iron cylinder having a screw thread cut upon its surface is firmly fixed upon the axle of one pair of wheels of the truck of a car; a like cylinder, of smaller dimensions, is hung in bearings at the lower end of a lever frame in such a manner as to bring it parallel to that upon the axle. The fulcrum of this lever frame is an iron rod having loose bearings in the woodwork of the truck frame, and with this rod the lever frame carrying the smaller screw cylinder reciprocates.

To the the uper end of the lever frame is attached the rod leading to the brake handle, which rod is divided, and has a spiral spring interposed at the junction in such a manner as to make the pull of the brake elastic. A half turn of the brake handle draws this rod forward, causing the lower part of the lever frame, which bears the small screw cylinder, to move toward the larger screw cylinder fixed upon the axle of the wheels with which it engages, and by which it and the lever frame carrying it are moved toward one one side or the other of the car, according to the direction in which the latter is moving. A link-arm, one end of which is attached to the lever frame and which, moving with it, is connected by its other end to the end of one arm of a three-armed rocking lever, fulcrumed at the junction of its three arms and operating in such a manner that whichever direction the lever frame takes, by reason of its small screw cylinder engaging with the screw cylinder on the axle, the three-armed rocking lever will be moved so as to cause one of two links connecting two of its arms to an ordinary straight lever at one end of the truck frame, to draw inward, thus causing the other end of the last mentioned lever to move outward, carrying with it the rod connecting it with the beams of the brake shoes, and thus bringing the brake shoes against the thread of the wheels against the stress of springs, which withdraw the shoes the instant the brake handle is released.

A very slight turn of the brake handle will bring the screw cylinders into engagement, and the smaller cylinder will immediately begin to move in a direction at right angles to the length of the car, and parallel to the axis of the axle upon which the fixed screw cylinder is located, and it will continue to move in this direction until the strain upon the brakes exceeds the pressure exerted upon the brake handle, when it will disengage and fly back toward its former position; engaging again instantly, the excessive pressure ceases, and repeating this action until the car stops. This is accomplished so rapidly that the

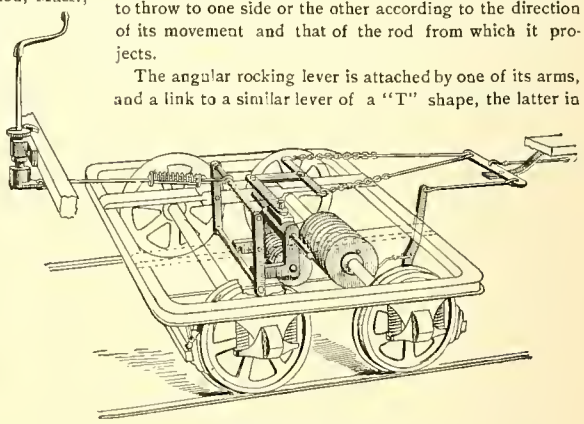


A NOVEL APPLICATION OF THE "C-S" FLUSH AUTOMATIC SWITCH.

effect upon the car is the same as would result from a continuous pressure of the brake shoes against the wheels, yet the several pressures have the effect of destroying the sudden jerk resulting from the locking of the wheels, and while avoiding the friction and consequent flattening of the peripheries of the latter, is none the less effectual in bringing the car to a stop.

In one end of the rod forming the fulcrum of the lever frame carrying the small screw cylinder is fixed a pin which reciprocates with the rod and causes an angular three armed rocking lever in the crotch of which it plays to throw to one side or the other according to the direction of its movement and that of the rod from which it projects.

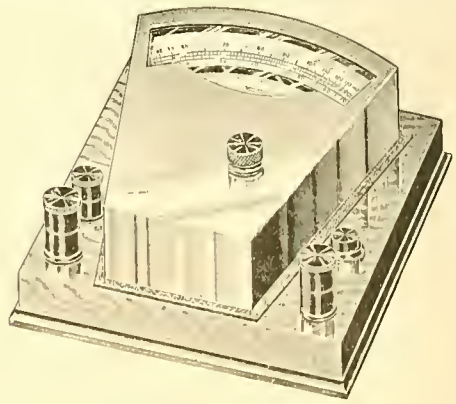
The angular rocking lever is attached by one of its arms, and a link to a similar lever of a "T" shape, the latter in



ELLIOTT CAR BRAKE.

turn operating an arm arranged above a rheostat. The rheostat also has an arm, against one side of which the last mentioned arm is pressed when going in the direction to cut off the current when the brakes are put on; but when the brakes are released the rheostat arm is left turned so that the motorman must by the ordinary means within his control turn on the current to start.

It will thus be seen that while putting on the brakes



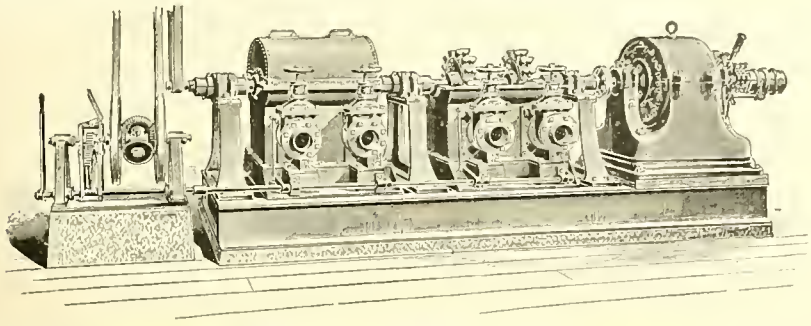
NEW WHITNEY ALTERNATING CURRENT INSTRUMENTS.

turns off the current, throwing off the brakes does not turn on the current, but leaves the car at a standstill until the motor man chooses to start it, when the brakes are in position not to retard its progress. Considering the fact that the greatest power necessary under any circumstances only requires that the brake handle be turned one-half of a revolution, it is clear that the action of the brakes is almost

if not quite instantaneous and that its lack of the rigid characteristics of the ordinary brakes makes the wear upon the wheels uniform, thus prolonging their life and usefulness.

Electricity In Mining Operations.

The accompanying cut shows an application of Pelton wheels to electric generators by direct connection to armature shaft. The wheels, four in number, are mounted on one shaft and connected to the generator shaft by an insulated coupling. They are 21 inches in diameter and have a combined capacity of 250 horse power, with a speed of 860 revolutions, under a running head of 340 feet. The



ELECTRICITY IN MINING OPERATIONS.

power from the station is carried thirteen miles and is used for general mining purposes.

The application here shown illustrates the extreme flexibility of the Pelton power system, and the facility with which adaptation can be made to all varying conditions.

The Pelton differential automatic governor, as shown on the left of the cut, insures absolute control, it is claimed, maintaining a uniform speed on the wheel, with instant and wide variations of load, and affords reliable means of of operating electric machinery by water power with a security and satisfaction.

A Novel Application of the "C-S" Flush Automatic Switch.

The accompanying cut shows a novel application of the "C-S" switch, described in a recent issue of the WESTERN ELECTRICIAN, in which it is so arranged that it will arbitrarily cut out the current from a hotel room by the process of locking the door from the outside.

As is shown in the cut the switch is placed in the moulding of the door jamb, immediately back of the striker plate, in such a manner that the push of the switch is directly in line with the movement of the bolt that is operated from the outside of the door. With this arrangement, when in the process of locking the door from the outside, the bolt is thrown, it engages with the switch push, thus opening the switch and turning off the lights, while locking the door from the inside has no effect whatever upon the action of the switch.

To provide means whereby the occupant of the room may turn the light off from the inside when desired, an auxiliary switch is placed on the inside of the room, in circuit between the controlling door lock switch and the lamps, in such manner that while the door remains unlocked upon the outside, the lamps may be turned on or off at will in the usual manner; but, whatever the position of this auxiliary switch may be, when the occupant locks his door from the outside upon leaving the room, the lights are invariably turned off.

This unique device is manufactured by the Cutter Electrical & Manufacturing company of Philadelphia.

New Whitney Alternating Current Instruments.

The Electric Appliance company, Chicago, is much elated over the success of the new Whitney instruments for alternating work. The alternating current voltmeter is an instrument with an almost uniformly divided scale, guaranteed absolutely accurate for the most careful measurements on any alternating current, being unaffected by variations in frequency. The Whitney instruments can be used on any kind of an alternating circuit or machine without in the least affecting the reading.

The uniform divisions of the scale is another point to which particular importance must be attached. Improvements in this respect are being continually made, and the voltmeter scales as now divided are even more uniform than shown in the accompanying cut. The 0 to 75 scales read from 15 to 20 in one-volt divisions and from 20 to 75 in half-volt divisions. The 0 to 150 scales read from 30 to 40 in two-volt divisions and from 40 to 150 in one-volt divisions. The double scale instrument combines both of these scales and reads in the same way.

The Whitney company has also met with success with its ammeter. Heretofore it has been almost impossible to make accurate quantity measurements of the alternating current without the use of a dynamometer requiring elaborate laboratory manipulation and considerable mathematical computation. This company is now supplying its agents and the trade and securing splendid results with an alternating ammeter guaranteed to be absolutely accurate and satisfactory, readable as low as one twentieth of an ampere in the small sizes with correspondingly small divisions for the larger capacities.

The Electric Appliance company is the general western agent for all of the Whitney products.

The Hawley Down Draft Furnace.

On account of the rigid smoke ordinances in Chicago and other western towns, the importance of equipping

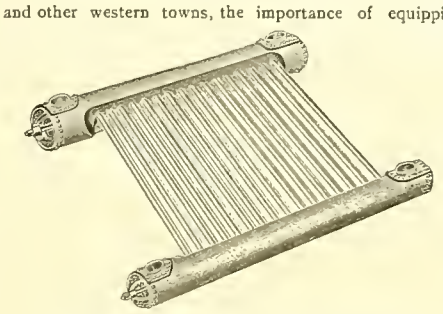


FIG. 2. HAWLEY DOWN DRAFT FURNACE.

steam plants with thorough smoke-consuming devices has been brought into prominence. In the East this important question has not received its share of attention, from the fact that anthracite coal is so largely used for commercial purposes; and wherever the smoke has occasionally proved offensive, some such appliance as a steam jet has been employed without regard to the small extra cost.

The accompanying illustrations show the operation of the Hawley furnace, as applied to a tubular boiler of the ordinary type. The upper grate, upon which the fuel is thrown, is formed of a series of tubes, opening at both ends into steel drums or heaters, which are connected by pipes to the boiler and through which, also, a constant circulation of water passes. By this arrangement the equivalent of a small water-tube boiler is added to the plant, and placed in the hottest part of the flame, thus greatly adding to its efficiency. A strong down draft carries the fuel through to the lower grating when partly consumed, and here it completes the combustion with an up draft, which thoroughly consumes all gasses and particles of carbon.

Thus the down draft system has two special features of very great advantage—a perfect combustion, which permits of the use of the poorest kinds of slack and refuse fuel with a very high efficiency, and an addition to the boiler in the water-tube grate, which increases both the economy and the capacity of the plant by almost fifty per cent.

No steam jets or other mechanical devices are employed, for they are unnecessary and only waste a portion of fuel already consumed. The saving in a short time from the use of the down draft furnace is enormous. Aside from the all-important feature of being absolutely smokeless, the saving in fuel is so great that in most cases the original outlay is paid for in the course of a year; in several instances in an even shorter time, by the greatly increased economy and efficiency obtained.

It is claimed for this furnace that it will burn any quality of coal with a consumption of ninety-five per cent. of smoke under all circumstances. From thirty to forty-five pounds of coal may be burned per hour over each square foot of grate surface with an evaporation of more than ten per cent. more water per pound of coal than is usually obtained. A uniform temperature of over 2,500 degrees Fahrenheit is reached in every part of the heating surfaces. With this furnace it is an easy matter to keep the boiler clean, since all impurities are quickly ejected from the steel drums at the end of the upper grate bars.

For electrical work, where sudden and heavy demands are frequently made on the boilers, the down draft system is of especial advantage. It has been found in the Edison stations in Chicago and at the city water works and gas works to meet every exaction beside being entirely smokeless. Some recent tests at these places have given surprising results as regards economy.

In most of the large cities of the West this type of furnace has been extensively introduced by the Hawley Furnace company. The principal office is at 806 Security building, Chicago, under the management of Dion Geraldine, late city engineer. Ellis Wainwright is president.

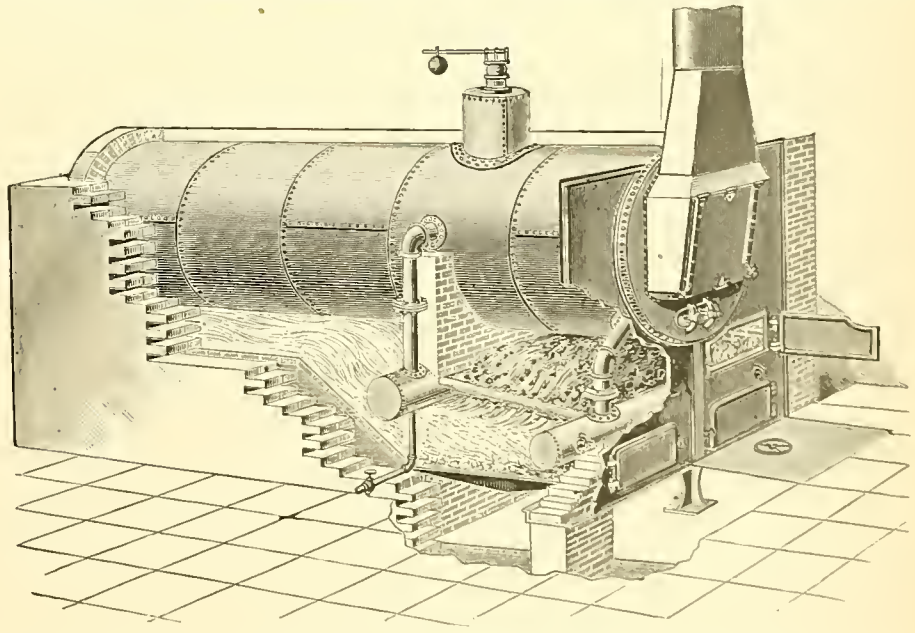

FIG. 1. HAWLEY DOWN DRAFT FURNACE.

It is rumored at Toledo, O., that the right of way has been secured into the heart of the city for an electric railway, which will connect Toledo and Detroit. There can be no doubt of the success of the scheme, as it is backed by two noted Michigan men, who are abundantly able to carry out the project—Senator James McMillan and Millionaire Joy. The line will strike Ohio just above Manhattan and will have its terminus at the junction of Oak and Summit streets. The capital stock will be about $600,000, and it is proposed to carry passengers between the two cities for $1.50, as compared with $2.60 by steam railroads.

A company is being formed at Chambersburg, Pa., for the purpose of putting in electric street railways on the main streets of the city; also to extend the road to Fayetteville and Green Village. It is said that capital to the amount of $500,000 has already been obtained for the new enterprise.

CORRESPONDENCE.

New York Notes.

NEW YORK, May 20.—The attempt to secure rapid transit for New York is blocked again. The free comment which has been recently passed on the action of the Rapid Transit commissioners seems to have had the effect of arousing that body to a sense of responsibilities, and a disposition to bring to bear on the situation the judgment and firmness it demands has, alas, too late, begun to manifest itself. At the meeting the commissioners on the 15th Comptroller Myer advised the commission to adhere to the original demand in the matter of the extension of the Manhattan elevated railroad, namely, that the company pay to the city 5 per cent. of its net receipts, meaning the gross receipts, less operating expenses and taxes, as compensation for the privileges of extending its lines over the routes agreed upon. He insisted that it would not be fair to the city to accept 5 per cent., after taxes, operating expenses and interest on funded debt were deducted, and upheld the fairness to all concerned of the original demand. On the 17th inst. there was another meeting of the commission, at which these ideas were embodied in a letter to the Manhattan Railroad company. In a letter received to-day by the commission, George J. Gould, president of the Manhattan Railway company, announces that the directors cannot accept the terms proposed, and do not feel called upon to modify the suggestion made to the Rapid Transit commissioners in their letter of May 5th. The Manhattan company asked the commission not to tax the interest on its funded debt,—aggregating $40,000,000, which interest would be $2,000,000 per annum, but expressed its willingness to pay 5 per cent. tax to the city on its net income, provided the $2,000,000 was deducted therefrom. The remaining point at issue is the Kingsbridge extension to the city line. The Manhattan company refuses to make the extension until the city extends its growth in that direction. So there is a block, and the situation is pretty well defined in the words of one of the commissioners, who at the last meeting is reported to have said: "There is no question that now the Manhattan has us just where it wants us. This commission has played into the hands of that corporation. Just what I have been fighting against has happened. This, I maintain, is a sad day for rapid transit in New York city. It simply kills the whole matter." New York, suffering and helpless in the grip of corrupt and unscrupulous corporations, is a sorry sight in these enlightened days.

The general assignment of Erastus Wiman for the benefit of his creditors is said to have been caused by the recent excitement in Wall street. Mr. Wiman states that he had nearly effected an arrangement with the General Electric company, which would have relieved him of liability for the payment of $150,000, and would have provided the money necessary to complete the new plant of the electric lighting company at Livingstone, now almost finished. The condition of the money market led the General Electric company to withdraw, and Mr. Wiman, having separated himself from other sources of supply, was compelled, after consulting with the Boston banks, which held the company's notes, to apply for a receiver. The result, so far as Mr. Wiman is concerned, is that liabilities of $150,000, which he had good reason to believe would be extinguished, are in force, while assets, which have cost him in cash $200,000 practically sink out of sight. Thus a difference of $350,000 is made in his estate. It is understood that the negotiations had progressed so far that the General Electric company paid two weeks' pay rolls of the Staten Island company, and had three of its representatives elected upon the board of directors.

The phonograph bucket shop at 40 New street has been "pulled" by the police. It was a scheme for speculating on four mining stocks with marked prices made on the premises. The chief factor in the business was a big phonograph which recorded the "fluctuations" of the stocks already loaded on the cylinder, and whose records were taken down on the blackboards by two clerks. There were two parties in this interesting game. One was Rumble & Co., the power behind the phonograph; the other was the customer. The customer put down the money, and Rumble & Co., after a few turns of the phonograph cylinder, raked it in. The crop of gambling fools is surely never ending, or such a transparent fraud as this would deceive no one. As it was, however, Rumble & Co. did a roaring business, and felt greatly aggrieved at the officiousness of the authorities in putting a stop to their roguery.

News comes from Washington that formal charges have been filed against W. E. Simonds, the late commissioner of patents, and Foster & Freeman, the Washington attorneys for the Bell Telephone company, alleging improper inspection of the secret files in the Drawbaugh telephone cases, and the unlawful taking of copies thereof for the private use of Mr. Simonds and of the Bell telephone company. Chief Clerk Bennett of the Patent Office is also mentioned in the transaction. The charge is said to be indignantly disowned by Foster & Freeman. Mr. Bennett states that he furnished the copies, and would do so again, as a simple discharge of his duties, if he were called upon to do so. W. F. O.

Milwaukee, Wis.

MILWAUKEE, May 20.—A peculiar accident occured a few days ago at the power house of the West Side Railway company. The water main in front of the power house burst, filling the street with water. The submerged tracks and the impossibility of getting water for the boiler made it necessary to abandon the whole line. The break occured at 8 o'clock in the evening and it was 10 o'clock before the water could be turned off. Supt. Trapschuh, of the water distribution department, said that the accident was due to the eating of the pipe by electricity escaping from the main car cables. The cable ran parallel to the pipe and close to it. Similar accidents, Mr. Trapschuh said, had occurred in other cities where the main cables are close to the water mains, and he had been expecting such an accident in Milwaukee. The lead pipe connecting the main with the property directly opposite the power house has been destroyed by electricity three times during the past two years.

An important telephone decision has been rendered at Eau Claire. A. Jackson has sued the Wisconsin Telephone company to recover damages for the loss of a barn which had been destroyed by fire as a result of a bolt of lightning following one of the telephone wires which was strung over the roof of the barn. The jury disagreed the first time that the case was tried. It has just been tried again, the jury giving the plaintiff a verdict for $9,258.73.

The Common Council of Marshfield has awarded to the Marshfield Water, Electric Light & Power company a contract to light the city with electricity. Twenty-three lights are to be used and they will cost $1,800 a year. The company asked the council for a thirty year franchise, but even had the aldermen been disposed to grant such a franchise they would have been prevented by a law which the last Legislature passed.

An automatic switch-throwing device has been successfully tested on the lines of the Milwaukee Street Railway company. The device is the invention of Samuel Walker and Le Grand Marshall. Mr. Walker, seeing the necessity of something that would take the place of the old-time iron hook, conceived the idea of the device, which has been tested to the satisfaction of the street railway people. The part of the device attached to the car consists of a cam-post extending downward under the car, just in front of the life-guard. The cam-post is connected with the front platform by a handle, which is used to turn it either to the right or to the left, at the will of the motorman, and a pedal upon which the motorman, by pressing his foot, makes the cam post descend. The cam-post in descending comes in contact with two bars, one parallel and the other at an angle on the top of a cast-iron box placed between the rails. These bars, which slide from side to side, are connected with a lever which runs to the under side of the switch tongue, which is moved by the lever in obedience to the action of the cam-post upon the sliding bars. The long lever is protected by a heavy cast-iron covering, which shields it from dirt, snow and ice.

The Wauwatosa motor company has decided to equip its road with electricity. Contracts for furnishing the necessary power will be made with the Milwaukee Street Railway company and the company that now operates the street railway between the city and the village. As soon as the line is equipped with electricity the motor line will run cars through the city to the lake front, using the Becker line. In order to secure funds with which to make the improvement, the company has decided to issue bonds to the sum of $100,000, payable in gold at the end of ten years and bearing interest at the rate of 6 per cent. Half of the sum, it is said, has been subscribed. It is expected to build and equip the North Greenfield extension and to equip the present system by early summer.

The Menasha & Neenah street railway has been sold to F. S. Shoemaker, president of the American Cereal company of Akron, O. Mr. Shoemaker will visit the Twin Cities in a short time and make arrangements for equipping the line with electricity.

J. M. Duane and J. R. Davis, of New York, spent a week or ten days in the city recently, looking over the Villard electric railway interests. They represent a syndicate of New York capitalists that is negotiating for an interest in the Milwaukee street railway system. Messrs. Duane and Davis examined the various lines, the power houses, shops, etc., and it is said that the syndicate which they represent will take a large interest in the property. There is a suspicion that perhaps Villard is getting ready to part with some of his Milwaukee holdings. Recently it was announced that the North American company's holdings of between $4,000,000 and $5 000,000 of the bonds of the Milwaukee Street Railway company would be placed on the market, and it is possible that Messrs. Duane and Davis represent prospective purchasers of these bonds.

The Common Council has made some progress in the matter of street railway legislation. The ordinance requiring motormen to sound their gongs when their cars approach street crossings has been favorably acted upon. At a recent meeting of the aldermen the judiciary committee recommended that the ordinance be placed on file. In damage suits, it was stated, the company set up the claim that no law required the motormen to sound the gongs at street crossings. The ordinance was re-referred and adopted at a subsequent meeting. The plan to require the street railway company to give checks good for another ride when delays or break-downs occur has been killed apparently. C.

New England Notes.

BOSTON, May 20.—The Milford & Hopedale Storage Battery Street Railway company is in trouble. The Brush Electric company and the Consolidated Electric Storage company have brought suit against the railway for alleged infringement of the patent granted C. F. Brush March 6, 1886.

The Marlboro, Mass., Electric Street Railway company has chosen officers as follows: President, E. R. Alley; treasurer, Thos. T. Robinson; director, S. H. Howe. A committee has been appointed to purchase land for a new car house and to extend the road to Southboro, if the permission of the authorities can be obtained.

Two heavy verdicts for damages have been granted against the West End Street Railway company and the Lynn & Boston Street Railway company. Frank M. Cavanagh sued for damages caused by a car suddenly being started up, which threw him to the ground and injured his leg so that it had to be amputated. He secured a verdict of $18,000. The suit against the Lynn & Boston company was based on much the same grounds, and a verdict of $17,000 was given by the jury.

Cambridge is discussing the plan of starting a municipal lighting plant. President Russell of the Common Council has introduced an order contemplating this enterprise.

A big electric web is to be woven around Brockton to connect it with Stoughton and the Bridgewaters. The Rockland & Abington company has awarded contracts for the building of a line to connect Rockland with Abington, Whitman and Brockton. The road will use an equipment of Westinghouse pattern. A car house 100 by 150 feet is to be erected near the Rockland line. The road will also in time be extended to the Weymouths, where it will connect with the Quincy & Boston road and thus connect Brockton with Boston. The formation of four other street railways has been effected as follows: Brockton & East Bridgewater, five miles; capital stock, $100,000; directors, Aaron Hobart, R. O. Harris, East Bridgewater; Alfred A. Glasier, George H. Campbell, Alston Burr, Boston; H. B. Rogers, John P. Morse, Brockton. East Bridgewater & Bridgewater, three miles; capital stock, $100,000; directors, James C. Leach, Hosea Kingman, Aaron Hobart, R. O. Harris, A. A. Glasier, G. H. Campbell and H. B. Rogers. Brockton & Bridgewater, six miles; capital stock, $200,000; directors, Hosea Kingman, J. C. Leach, A. A. Glasier, G. H. Campbell, Alston Burr, J. P. Morse and H. B. Rogers. Brockton & Stoughton, five miles; capital stock, $150,000; directors, Chas. Tenney and Geo. F. Walker, Stoughton; A. A. Glasier, G. H. Campbell, Alston Burr, J. P. Morse and H. B. Rogers. The capacity of the Brockton power station is being doubled to provide power for the proposed roads.

The Thomson-Houston Electric company has brought suit against the Winchester avenue and West Haven electric road in New Haven, Conn., for alleged infringement of the trolley patents. Damages are set at half a million dollars. A. C. Pond of Boston is president of the defendant corporation, and it is understood that he intends to fight the case to the last extreme. The statement is credited to an official of the New Haven road that the ground of the defense will be to attack the validity of the trolley patents by citing the fact that the trolley was used nearly a quarter of a century ago in telegraphing from moving trains.

J. C. E.

PERSONAL.

Cards are out announcing the marriage of Miss Idabel Blakeman to Henry G. Issertel of the A. B. C. company, New York.

NEW INCORPORATIONS.

Automatic Electric Railway Signal company, New York, N. Y.; capital stock, $3,000; to manufacture and sell automatic railway signals.

Woodstock Electric company, Woodstock, Vt.; capital stock, $22,000; to manufacture and sell electricity for light, heat and power purposes.

Franklinville Electric Light company, Franklinville, N. Y.; capital stock, $12,000; to manufacture and use electricity for light, heat and power.

Nazareth Electric Light & Power company, Nazareth, Pa.; capital stock, $10,000; supplying light, heat and power by means of electricity. G. W. Mackey, Bangor, Pa.

Pleasure Resort Railway company, Denver, Colo.; capital stock, $100,000; to build an electric street railway from Denver to resorts and places of amusement in or near the city.

Electric Developing & Supply company, St. Paul, Minn.; capital stock, $100,000; to manufacture and sell dynamos, motors, electrical machinery and supplies of every description; N. L. Hills, St. Paul, Minn.

Winchester Electric Light company, Winchester, Ill.; capital stock, $14,000; to establish and operate an electric light plant in Winchester, Scott county, Ill.; C. H. Condit, Winchester, Ill.

Beck-Watts Fixture company, Des Moines, Ia.; capital stock, $25,000; to manufacture, buy, sell and deal in fixtures of all kinds relating to gas, electricity, etc.; Hunn & Evans, Des Moines, Ia.

D'Unger Electrical Telephone Manufacturing company, Chicago, Ill.; capital stock, $100,000; to manufacture electrical telephones and other electrical appliances; H. S. Folger, 167 Dearborn street, Chicago, Ill.

Old York Road Passenger Railway company, Philadelphia, Pa.; capital stock, $15,000; constructing and operating an electric railway in Philadelphia; John A. Rigg, 8th and Dauphin streets, Philadelphia, Pa.

New Bedford & Fairhaven Traction company, Jersey City, N. J.; capital stock, $1,000,000; to construct and equip street railroads in New Bedford, Mass.; Waller, Cook & Wagner, 15 Wall street, New York, N. Y.

Western Electric Supply company, Des Moines, Ia.; capital stock, $25,000; to manufacture, buy, sell and deal in electric supplies, material, machinery, improvements and inventions; Hunn & Evans, Des Moines, Ia.

Metropolitan Electric Engineering company, Chicago, Ill.; capital stock, $50,000; to manufacture and sell all kinds of machinery, especially electrical motors; Rohde, Staab & Fleischer, 81 Dearborn street, Chicago, Ill.

Enterprise Manufacturing company, Hartford, Conn; capital stock, $125,000; to develop and sell water and electric power; to manufacture and sell goods and fabrics and other articles; Austin Brainard, Hartford, Conn.

West Jersey Traction company, Camden, N. J.; capital stock, $3,000,000; the formation of traction companies for the construction and operation of street railways or railroads, etc., Mitchell B. Perkins, Beverly, N. J.

Wyoming Electric Light & Power company, Peoria, Ill.; capital stock, $15,000; to maintain and operate electric light plant in Wyoming, Ill., and deal in electrical merchandise and apparatus; E. B Hillman & Co., Peoria, Ill.

Spring Valley Electric Light company, Peoria, Ill.; capital stock, $25,000; to maintain and operate electric light plant, and deal in electrical merchandise and apparatus in Spring Valley, Ill.; E. B. Hillman & Co., Peoria, Ill.

Lake View Water company, Redlands, Cal.; capital stock, $1,000,000; to deal in water and water rights, works, ditches, pipe lines, etc.; real and personal property; to maintain and operate heat and power houses for electricity, etc.; F. E. Brown, Redlands, Cal.

High Shoals company, Harden, N. C.; capital stock, $50,000; to manufacture cotton, wool, etc.; to generate electricity by water power, applying, transmitting and selling the same or the power produced thereby and to do general mercantile business; Paul Bigelow, Harden, N. C.

Lackawanna Valley Electric Light & Power company, Mayfield, Pa; capital stock, $150,000; furnishing light, heat and power by electricity to the public in Mayfield, Pa., and to such persons, partnerships and corporations residing therein or adjacent thereto, etc.; J. W. Aitken, Carbondale, Pa.

Strowger Farm Motor company, Chicago, Ill.; capital stock, $4,000,000; to manufacture and deal in farm electric motors, made to propel all kinds of farm machinery, and operate movable and fixed machinery; to deal in patent rights, etc.; A. L. Stone, Chamber of Commerce building, Chicago, Ill.

ELECTRIC LIGHTING.

The electric light plant at Winchester, Ill., was totally destroyed by fire a few days ago. The loss is estimated at $18,000.

The Board of City Trusts, of Philadelphia, has passed a resolution appropriating $75,000 for electric lights and power in Girard College.

The Electric Manufacturing company, of Rockford, Ill., is asking for a right of way for wires and poles with a view of furnishing commercial lighting.

The Jackson, Mich., Light & Power company has purchased the plant and franchises of the Jackson Edison Light company, and the consolidated enterprise will be known under the title of the General Electrical company.

ELECTRIC RAILWAYS.

An electric railway will be constructed at Michigan City, Ind., at a cost of $225,000.

Franchises have been granted at Atlanta, Ga., to the Lithia Spring Railway company, to construct 10 miles of electric street railway.

It is reported that the street railway at Guadalajara, Mexico, has been sold for $400,000 to Baltimore and Philadelphia capitalists.

The Allegheny Valley electric railway, to run from Parnassus, Pa., to New Kensington, Westmoreland county, with a capital of $15,000, has been chartered.

The citizens of Appleton, Neenah, Oshkosh and other cities in Wisconsin have under consideration an electric system, giving the Fox River valley an electric road from Green Bay to Oshkosh and Berlin.

The projectors of the Pittsburg, Neville Island & Coraopolis, Pa., electric railway expect to get the line in operation at no distant date. From McKees Rocks to the end of the line the road will cost $135,000.

An electric street railway line is being surveyed between Martinsville, Ind., and Indianapolis. The chief projectors of the line are H A. Smock, Oscar Matthews, E. F. Branch and John Hardinck, Martinsville, Ind.

The Ashton & Clarksville Electric Railway company, Ashton, Md., has been incorporated to build an electric railroad from Ashton to Clarksville, forming part of the proposed electric railroad from Baltimore to Washington.

The Chillicothe, O., Electric Railway & Lighting system and the Juneman electric light plant have been sold to a New York syndicate for $140,000. New tracks will be put down, a two-mile extension will be made and a number of new cars will be purchased.

A new underground electric railway has been planned for Berlin, Germany, proceeding from Weidendammer Thor to the Belle Alliance place. The distance is about two and one half miles, which the train will run in seven minutes—a high speed for an underground line.

The electric street railway company at Winnipeg, Manitoba, has submitted to the city council plans for approval of several extensions to its present system for the coming summer, and is also arranging for opening a park for summer amusements, situated at the extreme end of one of its branches.

It is proposed to build an electric line from Martinez to Oakland, Cal. The new road will begin at Martinez and will run direct to Walnut Creek, where the road will branch. One line will be built down the valley through Alamo and Danville to Doughterty's Station in Alameda county, and the terminus will be located at Haywards. The branch will go into Oakland will leave the main line at Walnut Creek, and will cross the Contra Costa foothills at a point near where the new Broadway grade is to be built.

TELEPHONE.

The Bell Telephone company has obtained an exclusive ten years' franchise at Ottawa, Can., for $1,500 a year.

The Glenwood & Marianna, Ga., Telephone company will establish a system between these two points.

Corpus Christi, Tex., is soon to be connected with Nueces and Sharpburg by telephone. Another project is now being entertained to connect it with Alice.

The New York & Pennsylvania Telephone company has commenced the construction of a long distance line from Jamestown to Elmira, N. Y., via Salamanca, Olean and Wellsville. A branch will be run from Carrollton to Bradford, Pa.

The Pacific Telephone & Telegraph company will issue bonds in June to the amount of $600,000 for the establishment of a direct line from San Francisco, Cal., to Los Angeles. The new line will be from San Francisco to San Jose, San Juan, San Luis Obispo, Santa Barbara and Los Angeles, a total distance of 500 miles. The largest poles and very heavy wire are to be used, putting the overhead system on a par with any of the kind in the East, and making it as satisfactory as the underground system is in its way in the city limits. The money is also intended to provide for the completion of the underground system in Los Angeles and to place all the wires in Oakland underground in the same way that they have been laid in San Francisco.

TELEGRAPH.

The Western Union Telegraph company is trying to get a subway franchise in Syracuse, N. Y.

India now boasts of one of the finest land telegraph services in the world. Recently duplex messages were transmitted without relays a distance of 2,100 miles, over a line extending from Calcutta to Madras. The wire employed was of copper, and the feat was rendered possible by the employment of an apparatus introduced by a member of the Indian telegraph staff.

The commercial telegraphers of Boston and vicinity will hold a fast sending tournament in the near future. Prizes will be given for various classes of work, including both sending and receiving and typewriter and code work. This will be the first fast sending contest ever held in New England and it will be confined to operators within that district.

POWER TRANSMISSION.

Plans for the electrical transmission of power from the Folsom dam, on the American River, to Sacramento, Cal., have been submitted by the General Electric company, the Westinghouse Electric company and the Siemens & Halske company of Berlin. These plans have been submitted to W. F. C. Hasson, as consulting engineer, and he will soon submit a report.

An application has been made to the Swedish government for a concession to install an electric transmission of power from the Dal river waterfall at Mansbo to the Norberg mining district, a distance of some ten miles. The power to be transmitted will be about 200 horse power, and the potential will be about 10,000 volts. The town of Ostersund will also soon have an electric transmission of power from the Strup waterfall of the Indal river, which has not yet been utilized. The distance is about eleven miles, and the tension of the current is also to be 10,000 volts.

Sacramento, Cal., has a second long distance power transmission scheme. C. Van Norden, of the South Yuba Water company, is examining the project of transmitting electric power from Placer county, fifty-four miles distant. At Cape Horn Falls the company has 10,000 miner's inches of water that fall a distance of 1,600 feet. The Cape Horn fall by no means represents the power going to waste in the company's system of canals. At Boulder Ridge, a few miles east of Rocklin, the water is brought down to a point 360 feet above Sacramento, thus affording an abundant fall to generate any power that may be required in the immediate future.

A long distance power transmission plant has been completed at Walla Walla, Wash., by the General Electric company for the Walla Walla Gas & Electric company. The electric power plant consists of a 200 horse power alternating current generator, which transmits the power over a wire from three to five miles to an alternating current motor in the present works of the Walla Walla Gas & Electric company, where it drives a direct current power and lighting plant for lighting the streets and stores of Walla Walla. The water power is taken from Mill creek, and conducted through a pipe line about 5,000 feet long to the power station at the junction of the Yellowhawk and Mill creeks. The water-wheel is of the Pelton type.

MISCELLANEOUS.

The city council of Baton Rouge, La., has decided to furnish the city with an electric automatic fire alarm system. Bids for the work are advertised and construction will be commenced as soon as possible.

The consolidation of the gas company and the electric light company of Georgetown, Colo., has taken place. The name of the new organization is the United Light & Power company, and its capital stock is $35,000.

Judge Thomas issued an order on April 25th to J. W. Foster and F. H. Jones, assignees of the Incandescent Light & Power company of Norwalk, O., to sell the company's property at public sale for cash in front of the court house in that city. The assignees have not yet determined on a date of sale. The property was appraised a few week ago at $35,025.

The entrance examinations of the Massachusetts Institute of Technology will be held at the Rogers building, 491 Boylston street, Boston, on June 29th and 30th. A second series for those unable to be present in June will be held on September 19th and 20th. For detailed information in regard to requirements for admission and for catalogues of the Institute, address H. W. Tyler, secretary, Massachusetts Institute of Technology, Boston, Mass.

A dispatch from Council Bluffs, Iowa., says that a heavy storm visited that section recently and did considerable damage. A dozen persons were the victims of electrical shocks, one case resulting fatally. D. W. Patterson was sitting near a window at his home, with his little daughter near him, when the side of the building was struck by lightning and Mr. and Mrs. Patterson were prostrated. The mother and daughter soon recovered and summoned assistance, but the physicians found that Mr. Patterson had been killed instantly.

TRADE NEWS.

The Bryant Electric company, which has secured control of the Cleveland arc light cut-out and Cleveland switch, announces that it will keep these devices in stock. The company's Chicago office is at 1522 Monadnock building.

The Hawley Furnace company has issued a sheet descriptive of its stock. The references given of satisfactory tests of the Hawley smokeless furnace form a special feature. The address of this company is 125-127 South Clinton street, Chicago.

"Premier Products and Specialties" is the name of a little hand-book issued by M. R. Rodrigues, Brooklyn, N. Y. It is descriptive of the Premier specialties and motors. The Premier battery is given much attention in this book, which is intended merely to be a pocket edition for reference.

The Shawmut Fuse Wire company, Boston, whose office and factory were damaged by fire recently, has opened a temporary office at 85 Water street and factory and storeroom at 54 Pearl street. The company is well equipped in its new quarters and will have no difficulty in giving orders prompt attention.

The exhibit of magnet, line and rubber covered wire in the Ansonia Electric company's booth at the World's Fair, will give its customers some idea of the complete line of wire which it carries. The company's new W. W. lightning arrester is giving the best of satisfaction and it is pre-

pared to furnish this specialty in large quantities on short notice.

The Rose Polytechnic Institute is one of the leading engineering colleges of the country, and is especially fortunate in its thoroughly modern equipment and plan of instruction. It lays special emphasis on the practical side of technical education, which it is enabled to do throughout the whole course of four years by its ample shops and laboratories and exceptionally complete outfit, especially in the electrical department.

The Chicago Insulated Wire company has recently been reorganized. This company was formerly controlled and owned by the Great Western Manufacturing company. Edward Carroll of Leavenworth, Kas., is now the principal stockholder and the president of the company. He assumed control on March 1st. The officers are as follows: President, Edward Carroll, Leavenworth, Kas; vice president and general manager, T. C. Turlay, Chicago, Ill.; secretary and treasurer, W. M. Smith, Sycamore, Ill.

The Electric Appliance company, Chicago, is preparing to distribute a new catalogue of Whitney voltmeters, ammeters and indicators, calling particular attention to the new alternating instruments. Particular attention is called to the alternating ammeters which are the first of the kind on the market. Heretofore accurate measurement of alternating currents has required the use of a dynamometer, but the Whitney company claims to have produced an ammeter reading to one-twentieth of an ampere and absolutely accurate.

No better illustration of the growth in the manufacture of insulated wire may be found than the fact that there is a new factory in Chicago devoted exclusively to the manufacture of reels and spools. A. D. Benham, 206 South Clinton street, makes a specialty of this business. A recent glimpse at the interior of his factory and salesrooms revealed a most extensive line of goods. Mr. Benham's factory has been rapidly growing, and having at the present time all the orders he can possibly fill with the present facilities, he is casting about for new and more extensive quarters.

The pocket edition, No. 5, of the Manhattan Electrical Supply company's catalogue is most complete and gives a brief but comprehensive description of the company's large assortment of electrical devices and specialties. An edition of 50,000 copies of this number has been printed. It is particularly interesting in the department of telegraph apparatus. This company has constantly on hand a large assortment of annunciators, push buttons, burglar alarms, call bells and buzzers. Just at present it is making something of a run on miniature incandescent lamps. They vary from ½ to six candle power. The company is located at 36 Cortlandt street, New York.

The Interior Conduit & Insulation company has issued a new catalogue. In addition to a description of the many devices applicable to interior wiring, the catalogue contains complete specifications for the installation of the interior conduit system and also a code for customers who may wish to order by telegraph or cable. The Johnson switch, the Lundell motor and all devices are constructed to conform to standards and are particularly applicable to the Edison system of distribution. As it is practically impossible to catalogue at any given time all the improvements and new developments, the Interior Conduit & Insulation company respectfully solicits inquiry as to any device, method or apparatus which may not appear in the catalogue before excluding it from the opportunity of supplying the same.

No more complete catalogue of electric railway supplies has been published than the book recently issued by the Railway Equipment company of Chicago. The book comprises over two hundred pages, is neatly bound, well illustrated, and there is no article known to the street railway business that is not included in the stock of this company. Line material, track material, car equipments, station material and special tools all receive their due share of attention. In the back of the book will be found wire tables, and other tables useful to the trade. The book also contains an article descriptive of the electric railway, the process of its construction and equipment, and the means that should be employed to place it on a paying basis. It is a book that commends itself to the trade, and will give a good idea of the magnitude that the electric railway supply business has assumed.

BUSINESS.

The Ansonia Electric company, formerly the Electrical Supply company, recently secured an order for the entire equipment of the Columbia, Mo., plant with Stanley transformers.

The Donaldson-Macrae Electric company of Baltimore reports a good demand for its battery and fan motor outfit. It has recently equipped the telephone exchange at Baltimore with a number of its 150 ampere batteries, and also the Postal Telegraph company of Baltimore with 480 small cells of 25 amperes.

The Cutter Electric & Manufacturing company, Philadelphia, reports a large business for the past two months for its various specialties. Among the recent contracts closed for complete electrical work in its line are the St. Clair hotel, Detroit; Regent hotel, Brooklyn; Cornelius Vanderbilt's new home at King's Park, L. I., in which will be placed 900 key switches, and the New Home building, Pittsburg, Pa.

There is no doubt, generally speaking, that many of the exhibits in the electricity building and machinery building at the World's Fair are in an unfinished state, but it must be said to the credit of a number of firms making displays in these departments that there are a few which have exhibited creditable promptness. Among this number is the Campbell & Zell company of Baltimore, Md. This firm has a large battery of its boilers in operation in the machinery building, and according to W. A. Ross, the company's western representative, this very large exhibit is all finished, "except the white paint on the boilers." And, by the way, it should be stated that Mr. Ross is no more enthusiastic over the white paint order than are many of the other electrical and mechanical exhibitors.

The Elektron Manufacturing company is experiencing a lively demand for its improved electric elevators, and for the convenience of customers in that vicinity it has opened an office at 103 Milk street, Boston, and has appointed E. Marshall as manager of the elevator department and F. B. Corey as manager of the electrical department. Mr. Marshall has had a long experience in the elevator business in connection with the Otis & Graves hydraulic and power apparatus. The Boston office has recently installed electric elevators for Messrs. Curtis & Bolster, 2304 Washington street, Boston, and Frank Ferdinand, 2280 Washington street, Boston. The main office of the Elektron company at Springfield has recently sold electric elevators to the new Masonic Hall, Springfield, Mass; Brown, Thompson & Co., Hartford; W. H. King & Son, Springfield.

ELECTRICAL PATENTS.

Issued May 16, 1893.

497,310. Automatic Disconnector. William A. Cullen, Paterson, N. J.

497,324. Process of Making Mica Insulating Plates. Charles W. Jefferson, Schenectady, N. Y.

497,331. Automatic Time Stamp. Warren B. Martindale, Rochester, Ind.

497,335. Manufacture of Telephone Cables. William R. Patterson, Chicago, Ill

The invention comprises means for giving to the conductors of a strand a variable pitch, so that when two strands are placed alongside of one another the conductors of one strand will not be parallel to the conductors of an adjacent strand, induction being thereby prevented. In forming the strands the wires are fed forward at a uniform rate, while the twist is effected at a variable rate, or the conductors are fed forward at a variable rate, while the twist is effected at a constant rate.

497,336. Insulating Tape. William R. Patterson, Chicago, Ill.

The tape is weakened along one or more lines, so that when it is spirally wound around a conductor it is caused to buckle along one or more lines to form a helical ridge. Several tapes being thus wound one upon the other, considerable air space is left between the different layers, thus effecting an insulation having a low specific inductive capacity.

497,337 Overhead Electric Railway. William D. Patterson, Keokuk, Ia.

The trolley wheel is adapted to bear upon the upper side of the trolley wire, breakers being interposed between the sections of the trolley wire of a depth greater than the distance that the periphery of the grooved wheel extends below the upper surface of the wire. The switch upon the track is set in advance of the trolley switch, so that by the time the trolley wheel reaches the switch the car will have assumed a position at an angle to the trolley wire, thus causing the trolley wheel, when it reaches the interposed breaker, to swing at an angle so as to straddle the end of the branched section as the car proceeds upon the branch track. The trolley wire proper is supported by means of forked posts upon a pair of wires placed parallel and in substantially a horizontal plane, the posts being secured to the trolley wire, but fitting loosely upon the parallel wires, so that the trolley wire may be drawn up independently.

497,356. Electric Car Truck. George S. Strong, New York, N. Y.

497,361. Commutator Brush Holder for Dynamo electric Machines. Elihu Thomson, Swampscott, Mass.

497,366. Rheostat. Parvin Wright, Denver, Colo.

497 377. Trolley for Conduit Railways. Paul C. Just, Chicago, Ill.

497,382. Non-conducting Covering. Robert H. Martin, Brooklyn, N. Y.

497,394. Conduit Electric Railway. George Westinghouse, Jr., Pittsburg, Pa.

497,397. Lightning Arrester. Alexander Wurts and Charles F. Scott, Pittsburg, Pa.

Between the generator and the line supplied are placed a number of self-induction coils which do not impede materially the generator currents, even though they be alternating, but which will tend to choke lightning discharges of high frequency. Several such coils are placed in series, and their ends connected with plates immersed in a tank of running water. On account of the high resistance to ground through the water, but little leakage of dynamo currents takes place, while if a lightning change comes upon the line the same will pass to ground through the water and will be prevented from passing to ground through the self-induction coils, due to the opposing electromotive force produced therein.

497,404. Electric Cigar Lighter. William P. Carstarphen, Jr., Denver, Colo.

497,408. Electric Railway Signal. William H. Jordan, Brooklyn, N. Y.

497,411. Push-button Switch. Fred S. McGregory, Revere, Mass.

497,430. Circuit Protector. Harry W. Leland, Jersey City, N. J.

497,436. Sectional Contact Conductor for Electric Railways. George Westinghouse, Jr., Pittsburg, Pa.

497,438. Arc Electric Lamp. John C. Wray, Peoria, Ill.

497,439. Wire Hanger. Arthur J. Wylie, Rome, N. Y.

497,443. Galvanometer. Adrian H. Hoyt, Manchester, N. H.

497,449. Galvanometer. Adrian H. Hoyt, Manchester, N. H.

497,450. Electric Arc Lamp. Rudolph M. Hunter, Philadelphia, Pa.

The lamp is designed for constant potential circuits where it is customary to place two lamps in series, in order to secure the proper voltage for each lamp. The lamp is provided with three carbons, a middle one and two extreme carbons, two arcs being formed, one between each end of the middle carbon and the end of the adjacent extreme carbon. Regulating mechanism is provided for feeding the carbons. The arcs are connected in series.

497,468. Dynamo-electric Machine or Motor. Walter K. Freeman, Boston, Mass.

497,482. Shunt for Electric Light and Power Stations. Edward Weston, Newark, N. J.

497,489. Circuit Controlling Device. John P. Buchanan, Boston, Mass.

497,491. Automatic Cut-out for Electric Light Circuits. Charles Cuno, Wauwatosa, Wis.

497,494. Electric Arc Lamp. James Einstein, Munich, Germany.

497,495. Electric Rink. Midbury W. Hassan, Rochester, N. Y.

497,504. Armature Core for Electric Motors. James E. Stuart and Ulysses S. James, Helena, Mont.

497,507. Lightning Arrester. Alexander Wurts, Pittsburg, Pa.

A wire is run from the line to be protected to an artificial ground. The artificial ground is insulated from the earth for generator currents, but has sufficient conductivity to permit static charges of high potential to pass to ground. By this construction a path to ground is maintained at all times for static charges, thus preventing the accumulation of a high static charge and readily permitting the passage of such a charge when instantaneously formed.

497,508. Lightning Arrester. Alexander Wurts, Pittsburg, Pa.

When both sides of an electric circuit are statically charged and one side is discharged, as by a lightning arrester, a charge passes from one side of the circuit to the other through the generator, or translating devices, to establish equilibrium between the two sides, often causing injury in its passage. To prevent this a condenser is placed between the two sides of the circuit and the charge is transmitted from one side to the other through the condenser, thus protecting the generator and translating devices.

497,509. Lightning Arrester. Alexander Wurts, Pittsburg, Pa.

A condenser is connected between the line to be protected and ground, thus permitting the passage of an instantaneous charge, while in shunt with the condenser is a wire of high resistance, which permits gradual discharge of low charges as they form, while preventing passage of an appreciable dynamo current to ground.

497 513. Hydrothermal Mining Process. Charles W. Beehler, St. Louis, Mo.

497,515. Insulator. Thomas H. Brady, New Britain, Conn.

497,521. Electric Measuring Instrument. Adrian H. Hoyt, Manchester, N. H.

497,522. Galvanometer. Adrian H. Hoyt, Manchester, N. H.

497,529. Stop Mechanism for Steam Engines. William M. Wood, Elmira, N. Y.

497,535. Process of Manufacturing Electric Conduit Sections. James F. Cummings, Detroit, Mich.

497,536. Underground Conduit for Electrical Conductors. James F. Cummings, Detroit, Mich.

497,539. Electrical Measuring Instrument. Oscar Frölich, Berlin, Germany.

The instrument is constructed on the principle that when two currents flow at right angles a magnetic needle assumes a position corresponding to the resultant force. In order to adapt this principle to measurement of the strength of a current, one of the perpendicularly flowing currents is maintained constant, while the other to be measured causes a deflection of the needle proportional to the current to be measured.

497,540. Device for Illuminating Gun Sights by Electricity. Giovanni G. di Giovanni, Turin, Italy.

Means are provided, such as a small incandescent lamp and a battery, for illuminating the sight of a gun at the moment of aiming and firing at night or in the dark. A key is provided under control of the person using the gun for closing the circuit and effecting the illumination as desired.

497 552. System of Conductors for Electric Fire Engines. Joseph Sachs, New York, N. Y.

497,558. Electric Arc Lamp. Frank H. Thompson, Philadelphia, Pa.

497,563. Electric Pump Governor. Charles R. Whittier, New York, N. Y.

497,585. Closed Conduit for Electric Railways. Archibald J. Martin, Philadelphia, Pa.

497,621. Process of Electro Tin Plating. Louis Aronson, New York, N. Y.

497,649. Magneto Telephone. James P. Freeman, Washington, D. C.

497,680. Safety Cut-out Apparatus for Networks of Multiple Electrical Conductors. Paul Nordmann, Berlin, Germany.

497,732. Binding Post Fuse. Simon H. Stupakoff, Pittsburg, Pa.

497,733. Wire Tightener. Simon H. Stupakoff, Pittsburg, Pa.

497,755 System of Electrical Distribution. Waldemar Meissner, Königsberg, Germany.

The translating devices are connected between a number of parallel conductors, the extreme conductors being connected with the terminals of a dynamo. In order to maintain the potential difference between the other conductors, auxiliary generators are connected between one of the extreme conductors and each of the other parallel conductors.

497,756. Circuit Switch. Ernst Woltmann and Harry A. Triggs, Denver, Colo.

Eugene F. Phillips, Prest. W. A. Hathaway, Treas. W. H. Sawyer, Sec'y.

THE "CLARK" WIRE.

TRADE MARK.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

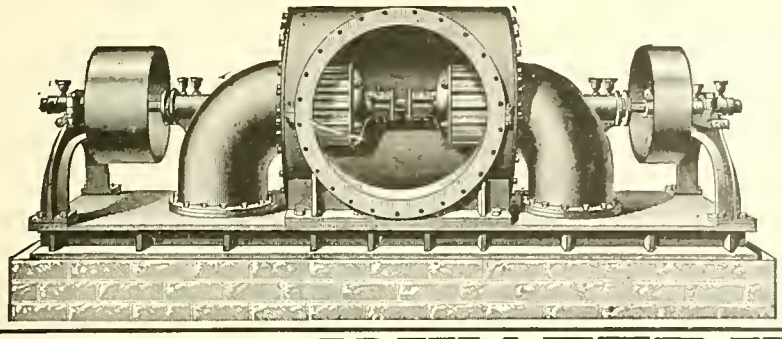
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its diameter, being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

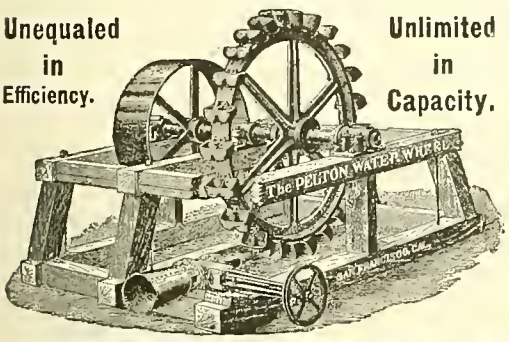
The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency. Unlimited in Capacity.



Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

For the WESTERN ELECTRICIAN,
—$1.00.—

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin.

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 6¼ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $21,193.56, with interest from the 22d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,
Receiver of the Milwaukee Electric Railway Company.

NEW BOOKS! — JUST OUT OF PRESS.

NEW
DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

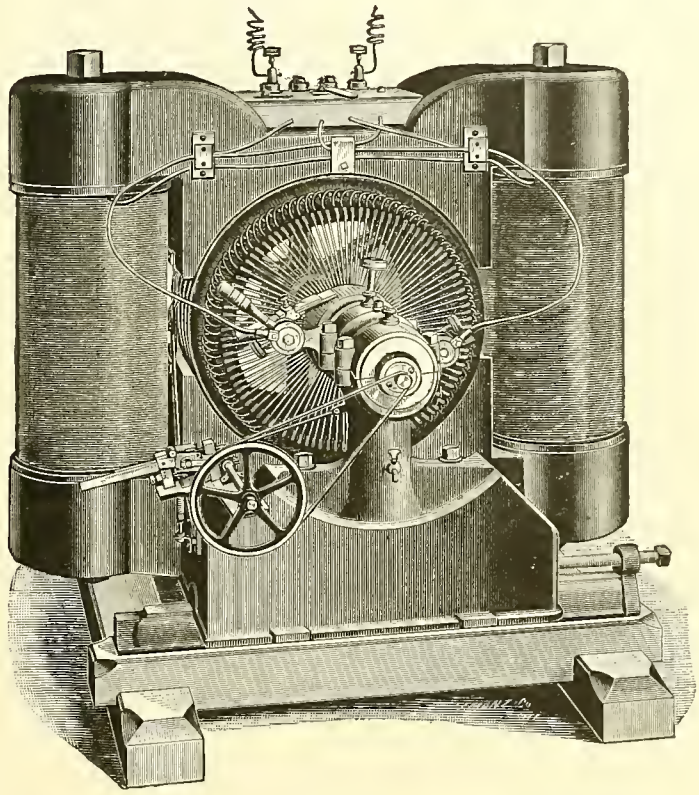
Works: 313-317 South Canal Street,

BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



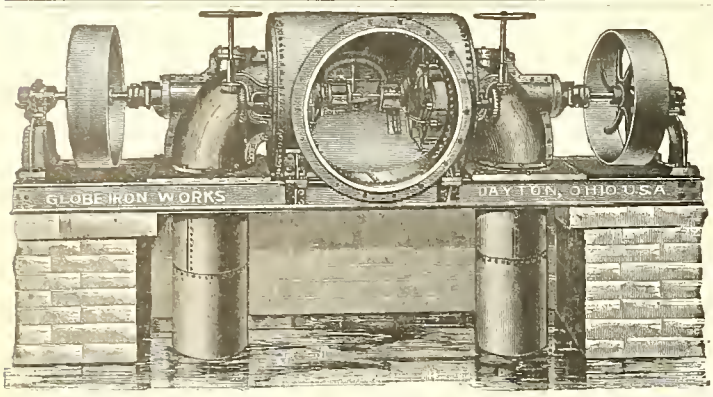
ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.



THE NEW AMERICAN
TURBINE WATER WHEEL.

PARTICULARLY ADAPTED TO DRIVING

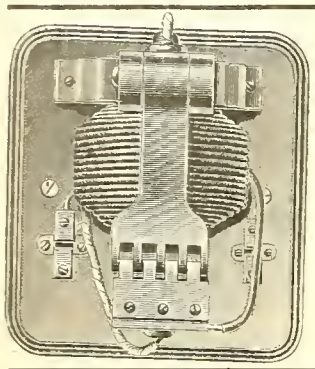
Electric Light and Power Stations

On account of its high efficiency at all stages of gate, steadiness of motion and easy working gate, the construction of which makes it the most sensitive to the action of a governor of any wheel on the market.

SEND FOR CATALOGUE Illustrating various styles of setting on both vertical and horizontal shaft.

THE DAYTON GLOBE IRON WORKS CO.,

SUCCESSORS TO
STOUT, MILLS & TEMPLE. **DAYTON, OHIO.**

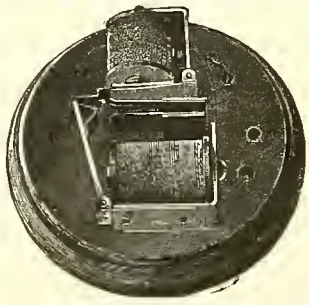


THE KESTER
Automatic Lightning Arrester

Will take care of any number of discharges of lightning per minute. They will prevent damage from lightning on any circuit not using the ground for return. They are intended only for station use and for the protection of generators and motors. They have no equal. They automatically rupture the arc formed by the lightning, and never short-circuit, thereby grounding the line. Price, $15.00 per set of two, and any one purchasing a set will be allowed to return them and have their money refunded provided they do not absolutely protect all circuits to which they are attached.

KESTER ELECTRIC CO.,
DYNAMOS, MOTORS AND POWER GENERATORS,
TERRE HAUTE, IND.

THE SECHRIST AUTOMATIC SWITCH



For controlling Incandescent Lights in private residences by using automatic gas keys and an ordinary battery or shunt circuit.

WANTED:—One good construction firm in each city to represent us.

Apply to

No. 444.

THE KNAPP ELECTRICAL WORKS,

54 and 56 Franklin St., Chicago, Ill.

The Equipment Necessary For a Model Station:

BAUER SWITCHES
On your Switch-Board.

Well Made.
Quick Action.
Positive Break.

WIRT AMMETERS.
See Catalogue 23, p. 138.

Handsome, Accurate, Standard.
No Springs.
No Recalibrating.

WIRT Volt Indicators.
See Catalogue 23, p. 137.

The Standard and Most Reliable. Pays for Itself in Saving of Lamps.

WIRT Standard Fuse LINKS.

All one piece—
No Soldered Ends.
Carefully Graded and Reliable.

SHIELD BRAND
Moisture-Proof
LINE WIRE.
Pages 6 to 9.

The Only Moisture-Proof (not rubber covered) Line Wire on the Market.

No Leaking Lines—Saves Break-Downs and Accidents. Keeps up the Coal Pile and the Bank "Pile" at the same time.

HABIRSHAW
Standard Red Core Rubber Covered
WIRE.
The Only Pure Para Rubber Covered Insulation Made.

For House Wiring, for Cables or any Place where the Highest Insulation is Required.

It Never Fails.

STANLEY TRANSFORMERS.
Solid Moisture-Proof Insulation.
Lightning-Proof.

Highest Efficiency, Closest Regulation, Most Convenient to Handle.

HIGH INSULATION BRACKETS.
See Pages 43 to 48.

Strong, Graceful.
Made from Carefully Designed Patterns.

W-W Lightning Arrester.
The Simplest Made.

Protects your Line and Dynamos. No Magnets, no Springs, no Swinging Balls.

The New Sunbeam Lamp.

The Highest Economy combined with Long Life and Efficiency.

The Wirt Dynamo Brush.

Saves the Commutator, and Prevents Sparking and Cutting.

The Only Brush Built on Scientific Principles.

A Plant with above Equipment insures SAVING IN POWER, SAVING IN REPAIRS, SAVING IN TROUBLE—all in all, a Model and Successful Station. Correspondence Solicited and Promptly Answered.

The Ansonia Electric Co.,

FORMERLY THE ELECTRICAL SUPPLY CO.,

FACTORIES AND EASTERN OFFICES, ANSONIA, CONN.

Cor. Randolph St. and Michigan Ave., CHICAGO.

NOW READY TO TAKE ORDERS FOR THE

NEW SUNBEAM

FOR IMMEDIATE SHIPMENT.

NOTE!

The "New Sunbeam" is an incandescent lamp made with a globe not all glass and without inleading wires sealed into glass.

There Is no Vacuum in this Lamp.

The globe is filled with **A GAS** that acts to build up the filament during incandescence, thus maintaining the lamp at full candle power throughout its entire life.

THE STAR ELECTRIC LAMP COMPANY,

805 CHAMBER OF COMMERCE, CHICAGO, ILL.

SELLING AGENTS: { THE ANSONIA ELECTRIC CO., 104 Michigan Ave., Chicago, Ill. | CHAS. D. SHAIN, 136 Liberty Street, New York. | THE ANSONIA ELECTRIC CO., Ansonia, Conn.

WESTINGHOUSE ELECTRIC & MFG. CO.,

PITTSBURGH, PA.,

MANUFACTURERS OF APPARATUS FOR

Arc Lighting, Incandescent Lighting,

LONG DISTANCE TRANSMISSION OF POWER,

Street Railway Generators, Motors and Appliances.

Our alternating current incandescent apparatus is in use in 430 central stations. 1,000 isolated plants. Our arc apparatus is in use all over the world.

We are now transmitting light and power various distances up to 28 miles from the source.

Our multipolar railway generators and noiseless single reduction motors have worked a revolution in the electric railway field in two years.

Orders for APPARATUS, REPAIRS and SUPPLIES formerly furnished by the United States Electric Lighting Co., Newark, N. J., should now be sent to this Company, where they will receive prompt attention.

BRANCH OFFICES IN ALL THE LEADING CITIES.
AGENTS FOR CANADA: AHERN & SOPER, OTTAWA, ONT.

"NOVAK"

(TRADE MARK.)

We take pleasure in informing the public that after many months of experimenting we have succeeded in producing an Incandescent Electric Lamp superior to any of the numerous lamps hitherto offered to the public. The importance of the discovery may be realized when we inform you that the lamp now manufactured by us is a total departure in principle from all other incandescent lamps. Our lamp will maintain its

INITIAL CANDLE POWER at its INITIAL EFFICIENCY

throughout the usual average life of incandescent lamps.

The importance of this improvement can only be realized by those who have had the usual experience with lamps which begin to *decrease in candle power* and at the same time *increase their consumption of energy* as soon as put into service.

The "Novak" Lamp maintains its full candle power at the same efficiency throughout its life.

The "Novak" Lamp is fully protected by patents of our own, and is free from any possible claims of infringement of other patents.

The efficiency and average life of the "Novak" Lamp are fully equal to those of any other lamp ever offered.

The filament used in the "Novak" Lamp is the celebrated

"PERKINS" FILAMENT,

the superior quality of which is too well known to need comment by us.

We respectfully solicit correspondence in regard to the "Novak" Lamp, feeling sure that a lamp possessing the superior qualities of this lamp, and manufactured by a company whose business it is to supply the general public WITHOUT DISCRIMINATION, will be appreciated.

TRANSFORMERS

PERFECT SAFETY.

GOOD REGULATION.

30,000 WATT TRANSFORMER.

HIGHEST EFFICIENCY.

SMALL CORE LOSS.

CONVENIENCE IN INSTALLATION.

OIL INSULATION.

Best Possible Mechanical Insulation, with Additional Insulation of Oil. Primary and Secondary Coils are Fully Subdivided. No Fuses in the Transformer Case.

TRANSMISSION OF POWER BY ELECTRICITY OVER LONG DISTANCES

Is rendered practicable by means of our "Step Up" and "Step Down" Transformers, the Insulation in which is Tested to Withstand a Pressure of 10,000 Volts Alternating.

CARPENTER ENAMEL RHEOSTATS.

TWO-PHASE GENERATORS

Of our Standard Alternating Current Sizes, for use with

Stanley-Kelly Two Phase Motors.

"STANDARD"

Single Push Button Flush

SWITCH.

Awarded the first prize gold medal at the Second Annual Industrial Exposition held at Denver, March, 1893. The only one-push button Switch in the market. If the light is out it turns it on, and if the light is on, push the same button and it turns it out. We make this switch single pole, and 3-wire. This Switch is more practical and cheaper than any other push button Switch in the market. It does not need the aid of batteries, a shunt carreot or other cumbersome adjuncts.

PRICE, 10 Ampere, Single Pole, $1.50.

Liberal discounts to the trade.

ISOLATED PLANT VOLTMETER (One-Half Size), For Direct Current Circuits.

This instrument is just as accurate as our Portable Standard Voltmeter; it is absolutely dead-beat and free from all heating errors. It is reasonable in price, in short, the best instrument for the money in the market.

We recommend it especially for isolated plants, small electrolytic and marine plants. Made for any range from 1 volt to 300 volts over the whole scale.

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead-beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

Electricity at the World's Fair.

This is the week that will mark the formal opening of the electricity building at the World's Fair, and no better occasion could be chosen, therefore, for the presentation of an illustration of the most prominent feature of the building, the Edison "tower of light," which rears its graceful outline in the exact center of the structure. The picture given on this page is the first authentic representation of this striking portion of the electrical display to be made public and is a reproduction from a photograph. Some amusing pictorial guess-work in relation to this tower has been published, but the readers of the WESTERN ELECTRICIAN will have the satisfaction of possessing the first illustration showing exactly what this much-talked-of tower looks like.

The space on which the tower stands was originally allotted to the Phœnix Glass Works, which proposed to erect a glass pagoda, with incandescent light effects, but the General Electric company, whose space surrounds this allotment on every side, was also anxious to possess this desirable location, and so it came to pass, after many consultations between the gentlemen interested, that an agreement was reached by which the General Electric company was to erect the present structure, and the space about the base, enclosed by the colonnade, was to be devoted to the Phœnix company's exhibit. This plan was carried out, with the result shown in the illustration.

The "tower of light" is intended as a glorification of the Edison lamp and the Edison system of incandescent lighting. In these troublesome days of lamp litigation, therefore, it possesses more than ordinary significance. It was designed by Luther Stieringer for the General Electric company, and the plan was approved by Mr. Edison. The tower is 82 feet high and arises from a circular pavilion 32 feet in diameter. The glass exhibits in this pavilion are grouped in the space between the base of the column, which is polygonal and faced with mirrors, and the circular row of columns supporting the roof of the pavilion. Above the pavilion is a graceful cylindrical shaft of staff ending in an elaborately ornamented and gilded capital. The surface of the shaft is relieved by dark lines of molding, arranged in geometrical designs, as shown in the illustration, with little six candle power lamps of different colors inserted at frequent and regular intervals. Surmounting the capital of the shaft is the crowning feature, literally and metaphorically, of the tower. This is the great prismatic bulb composed of about 30,000 pieces of cut glass, arranged on a stout framework in the shape of an incandescent lamp. This mammoth lamp is about eight feet high and four feet in diameter at the point of greatest width. It was made by F. McLewee & Son of New York city. The prisms are made of cut glass and are only about three-fourth of an inch in diameter. To place each one in position required the services of two men, one working inside and one outside of the bulb frame. The frame is made of angle iron and covered with a wire hood, the shape of an incandescent lamp. The prisms were attached to the outside of the wire hood, and it took eight men five weeks to construct the bulb. Each prism was fastened with copper wire in order to avoid corrosion, this being the best metal for such purpose. The weight of the bulb complete is 1,000 pounds.

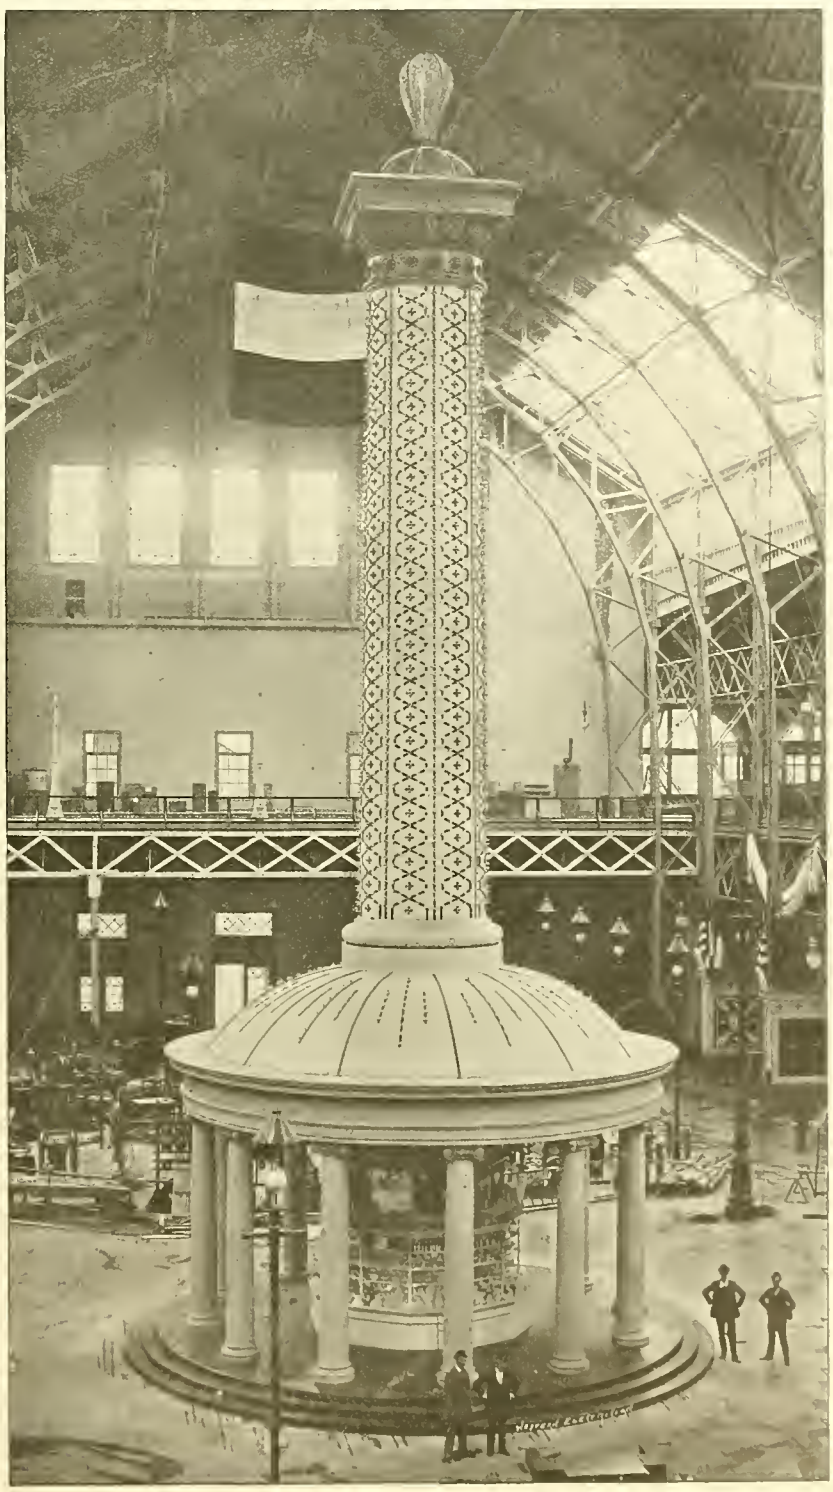

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—THE "TOWER OF LIGHT," ELECTRICITY BUILDING.

As the illustration proves the tower is handsome and impressive when not illuminated, but at night, with its 5,000 little points of red, white and blue light and the great bulb, lined with incandescent lamps of ordinary size, flashing and scintillating in every direction, the effect will be very striking and beautiful. The lamps on the shaft are wired in such a manner that the designs formed by the lines of light can be changed at will. The "tower of light" will linger in the memory of the visitor as one of the most beautiful spectacles at the fair.

Every section of the electricity building now lacks but a few finishing touches to be complete. The General Electric company has nearly finished its scheme of decoration, which includes flags and bunting, ornamental fixtures and colored lamps. A specimen of the treatment is shown in the corner illustrated in Fig. 2.

The new three-phase dynamos and motors will be quite extensively exploited at the exposition, for, in addition to the display made by the Allgemeine Elektricitaets Gesellschaft of Berlin the General Electric company makes an extensive showing in this line. Fig. 3 illustrates a 10 horse power three-phase motor directly coupled to a hoist, with a switchboard arranged for the multiphase system. This motor is designed to run at 900 revolutions per minute and is self-starting. Its switches are mounted on hard rubber bases. The drum of the hoist is 30 inches in diameter, with a 24 inch face, and is provided with band brakes.

Workmen are at last at work embellishing the unsightly expanse of blank wall at the southern end of the nave of the electricity building. The decoration is in the hands of the Westinghouse Electric & Manufacturing company, and although the plans have not been divulged, it is reported that the principal embellishment will consist of a figure of Columbus, eight or nine feet high, done in colored incandescent lamps and surmounted by an illuminated sign. This is an advantageous location for a decoration of this character, and it will undoubtedly attract much attention. It is also rumored that the Westinghouse company will have a similar wall decoration in machinery hall.

The appointment of William Wilson Primm as engineer of the department of electricity at the World's Fair has been formally approved. Mr. Primm has long been connected with the department, and this recognition of the value of his services is well deserved.

Among the recent visitors to the World's Fair was Arthur Bergtheil, of the firm of Bergtheil & Young, electrical engineers of London.

The subject of appointing judges and making awards is exciting much attention among the exhibitors in the several departments, and the system proposed is coming in for a good share of criticism. The executive committee on awards has one plan, however, that will probably meet with general approval. This consists of sending out blanks to absent exhibitors, who, by filling in the vacant spaces, will be enabled to set forth the claims of excellence made for their exhibits to the greatest advantage. These claims will be passed upon by the examining judges, so that exhibitors who are not present will be at little disadvantage. Each distinctive exhibit is to be described on a separate blank. Chief Barrett has a number of these blank forms, which he will distribute to absent exhibitors in the department of electricity.

The formal opening of the electricity building has been set for June 1st. On the evening of that day the Edison "tower of light" will be unveiled. The lights on the tower were successfully tested on Friday evening of last week. The Westinghouse company is finishing a beautiful golden pavilion north of this central tower, and these two structures, with the French beacon tower and the Bell telephone pavilion, constitute the most striking features of the nave of the building. The galleries are now well cleared up and everything will undoubtedly be ready on the date set for the formal opening.

One of the most valuable portions of the display in electricity building is in the northeastern gallery, where the German scientific instruments are displayed. Although many electrical measuring instruments are shown, there are also surgical, optical and meteorological instruments, as it was not deemed wise to divide the national showing in instruments of precision. One of the curiosities is a complete model of a boiler and steam engine so small that it is enclosed in a walnut shell.

There is no more attractive wire exhibit in electricity building than that of Day's kerite, which is located in the southeastern portion of the gallery, near the offices of the department of electricity. As will be seen by the photographic reproduction in Fig. 1, the display is admirably designed and gives a very pleasing impression. Over 1,000 square feet is taken up by the display, which comprises a complete exhibit of insulated wires and cables for all electrical purposes, including electric light and power, telephone and telegraph. An extensive showing of kerite elastic tape for insuring water-proof joints is also made. To the average visitor one of the most interesting features will be the four growing rubber trees and the samples of crude Para rubber and crude kerite, showing the foundation of this widely known insulation. A number of photographs showing the manner of laying a kerite submarine cable are also shown. The particular instance depicted is the laying of an 18-conductor cable across the Hudson River at New York city for the Metropolitan Telephone company. In the center of the exhibit is a graceful pavilion in white and gold which forms the office and reception room of the company and to which the friends of kerite are extended a cordial welcome. The interior of this little snuggery is finished in sycamore and resembles the cabin of a handsomely furnished yacht. The furniture, decorations and incandescent lamps are all such as are supplied for the highest class of pleasure vessels. Even the door is of the regulation cabin pattern, and the cabinet is an exceptionally fine piece of workmanship. The entire pavilion was built in Waterbury, Conn., in sections, and then taken apart, shipped to Chicago and again erected. It is dainty and elegant in every appointment. The exhibit is in the competent hands of A. P. Eckert, who takes pride in showing the medals awarded to his company at the Centennial and at the Paris Exposition of 1878.

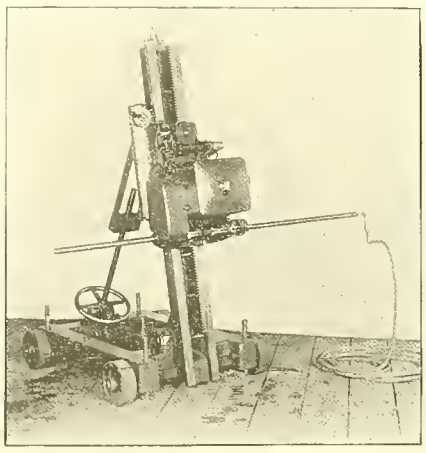

FIG. 5. ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC DIAMOND GADDER, ELECTRICITY BUILDING.

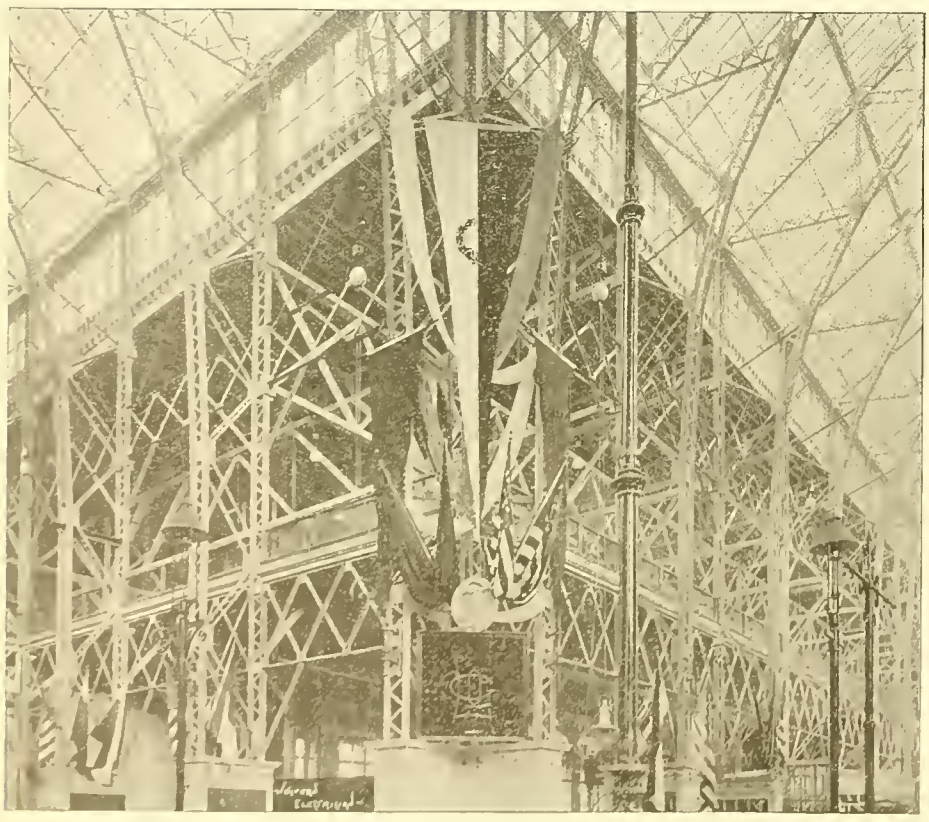

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.—A CORNER IN THE ELECTRICITY BUILDING.

In the line of electric drills and mining machinery the General Electric company will make a large display. A new machine which will be shown is the electric diamond gadder, Fig. 5, which is used for putting a series of holes on a true line in stone, for the insertion of plugs and feathers for breaking up the block. The machine consists of an electrically driven rock drill mounted upon, and made to traverse, a standard or post, which is attached by trunnions at the lower end to a cast-iron bed piece, and which is made to swing from a vertical position to a nearly horizontal one. The drill is attached to a saddle, which is raised or lowered on the standard by means of a ratchet. A catch is provided for fastening the saddle in any desired position. The car moves along the floor without a track, and is fixed in position by means of corner pins, which are driven into the floor and fastened by set-screws. Water is fed to the drill through a flexible hose, which is attached as shown in the picture. The motor and rheostat are attached to the standard.

World's Electrical Congress.

The committee on programme for the World's Electrical Congress has completed its proposed order of business. It will be noted that reference is made to the "general congress" and "chamber of delegates." The general congress will include a smaller body to be known as the chamber of delegates, which will consist of those specially designated as representative delegates from the several governments, appointed for the purpose of considering electric units and their values and making recommendations as to the necessary legalization. The opening session of the general congress will be held Monday, August 21st, at 3 P. M. The congress will be called to order by the chairman of the local committee, Elisha Gray, when the following order of business will be observed:

Election of temporary chairman and secretary, and appointment of a committee to nominate permanent officers will be the first business. The officers will consist of a president; a vice-president for each nation sending delegates to the chamber and a secretary.

Report of this committee.

Short addresses by the president, and by a few of the vice-presidents. Announcements and adjournments.

At the close of this meeting the chamber of delegates will assemble for preliminary organization, which will proceed as follows:

The chamber will be called to order by one of the delegates representing the United States.

Election of a temporary secretary.

Appointment of a committee of five on credentials.

Fixing a time for regular sessions. Adjournment.

At the next meeting of the chamber the committee on credentials will report, and a permanent organization will be completed.

The general congress will be divided into three sections, as follows:

(A) The section of pure theory, including electric waves, theories of electrolysis, electric conduction, magnetism, etc.

(B) The section of theory and practice, including studies of dynamos, motors, storage batteries, measuring instruments, materials for standards, etc.

(C) The section of pure practice, including telegraphy and telephony, electric signalling, electric traction, transmission of power, systems of illumination, etc.

These sections will meet for organization and work at 10 A. M., August 22d. Their organization will consist of the election of a chairman, a vice-chairman, a secretary and a sectional committee of three in addition to the officers named. Temporary presiding officers will be as follows: Section A, Prof. H. A. Rowland; section B, Prof. Charles R. Cross; section C, Prof. A. Graham Bell.

Sections will meet at 10 A. M., on Tuesday, Wednesday, Thursday and Friday, continuing in session at will, except on Friday, when they will finally adjourn as sections not later than 1 P. M.

Each section will have authority to divide into subsections if it is thought to be desirable.

Papers are solicited upon the following subjects, or upon other topics which may be considered suitable in character. They should be sent to the chairman of the programme committee, not later than August 1st. Such as are accepted by that committee, will be put upon the programme of the congress, to be presented in full or by abstract according to the time available.

Magnetic units and modes of embodying them in concrete standards.

Methods of avoiding electrical interference and risks to person and property.

National and municipal testing laboratories.

Materials for standards of electric resistance.

Points of difference of the electrical vocabulary used in different countries.

The direct conversion of the energy of fuel into electric energy.

Comparison of the various methods employed for the electric transmission of power.

The cost of insulation in relation to high pressure for the electric transmission of power.

Comparison of the economies of the various systems of electric distribution.

Alternate current motors.

The behavior of transformers when supplying power to alternate current motors.

The construction of condensers for alternate current purposes.
The measurement of power in polyphase currents.
Direct coupled and non-direct coupled dynamos.
The use of equalizing dynamos in a three and a five-wire system.
The use of accumulators in central stations.
The proportions between output of dynamos and the weight of copper and iron employed in their construction.
Electric traction.
Application of electric power in mining.
The adoption of a uniform method of distinguishing positive and negative mains.
Electric supply meters, American, British, Continental.
Criterion of sensibility of galvanometers.
Commercial instruments for measurement of electric quantities.
The relation between the voltage of the arc and the quality and composition of the carbons.
The aging of glow lamps.
The electric working of metals.
The use of electric and magnetic tests for ascertaining the mechanical properties of metals and alloys.
The best material and mode of erection of lightning conductors in the light of recent researches in electric discharges.
The prospecting for iron by magnetic surveys.

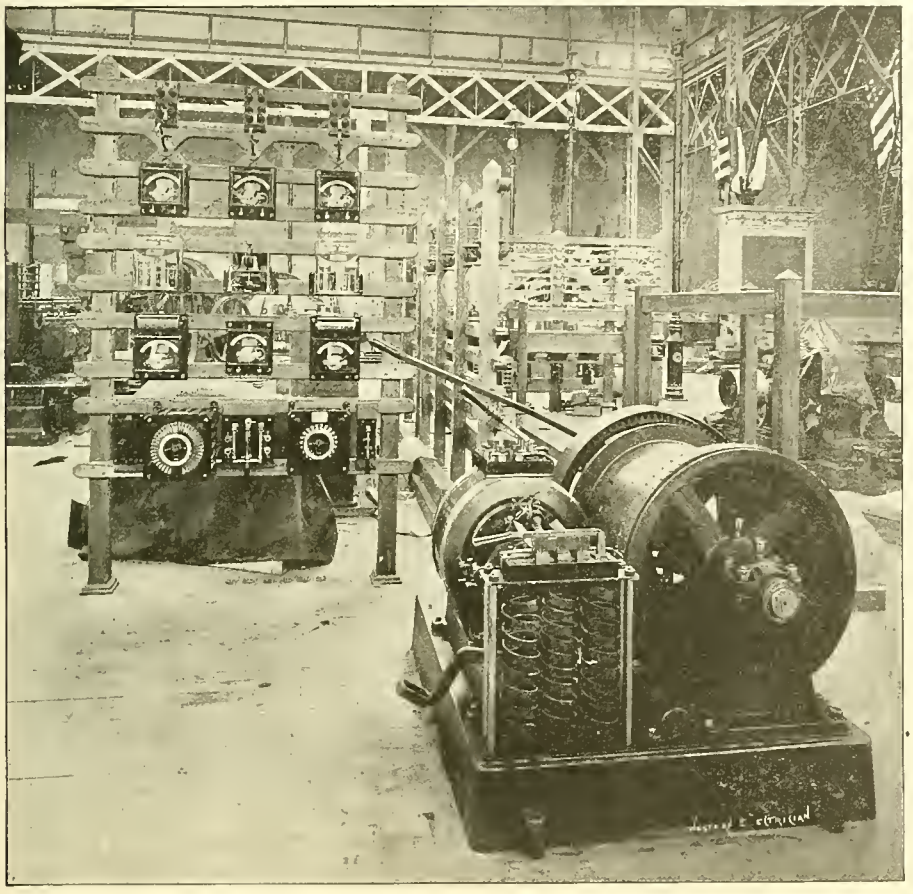

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.—THREE PHASE MOTOR, DIRECTLY CONNECTED TO HOIST, ELECTRICITY BUILDING.

International telegraphy.
Fast-speed and long-distance telegraphy.
The use of batteries or other generators for telegraphy.
Telegraphic lines—land and sea.
Harmonic telegraphy.
Writing telegraphs.
Long distance telephony.
The possibility of providing telephonic communication without wires.
Application of electric signaling to the working of railways, (alarms, time, etc.,) and to naval and military purposes.
Magnetic separators.
The use of electricity in engraving and in art reproductions.

The time allotted to the discussion of the papers presented will be determined by the several sectional committees. In the discussion of papers the chairman of the section will name the first speaker.

The following topics will be considered by the chamber of delegates, together with such other topics as may properly come before this body:

Adoption of definitions and values of fundamental units of resistance, current and electromotive force.
Adoption of definitions and values of magnetic units.
Adoption of definition and value of the unit of self-induction.
Definitions and values of light, energy and other units.
The standardization of electric lights.
The consideration of an international system of notation and conventional symbols and of a more uniform and accurate use of terms and phrases in electrical literature.
A commercial standard of copper resistance.

The hours of meeting for the chamber of delegates shall be determined, after the first session, by the chamber itself; and it shall also decide upon the admission of persons not delegates to its sittings.

It shall finally adjourn not later than 1 o'clock, on Friday, August 25th, and at the last meeting of the general congress, the officers of the chamber shall report to it a summary of its proceedings and the conclusions reached.

Public lectures of a popular character will be delivered by eminent electricians at 8 o'clock on Tuesday, Thursday and Friday of the congress week. The general congress will assemble to hear reports and for final adjournment at 3 o'clock, Friday, August 25th.

National Electric Manufacturing Company Asks for a Receiver.

Proceedings were taken in the Circuit Court last week by which the National Electric Manufacturing company's plant at Eau Claire, Wis., passed into the hands of a receiver.

The event caused a sensation so far as the public is concerned, but the matter has been under consideration for some time. An action had been brought by James T. Barber et al. against the National Electric Manufacturing company, the complaint in which sets forth that the company was embarassed by very pressing claims on the part of creditors which it was unable to pay; that the large plant and valuable business of the company could best be preserved in their entirety for the benefit of all concerned, by by the appointment of a receiver.

Mr. Hayden, attorney for the plaintiff, requested the appointment of Ralph E. Rust as receiver, bond being offered in the sum of $50,000, with William A. Rust, John S. Owen, James T. Barber and Fitch Gilbert as sureties. Judge Bailey made an order appointing Mr. Rust receiver.

Although the company, by reason of the general financial stringency, has been considerably embarassed, the conditions are such that under the receiver the business can and will be carried on without any interruption whatever. There will be no stoppage and a reorganization will probably be effected within a very few days.

The company's plant it is claimed is worth $300,000; there is a large amount of valuable manufacturing products on hand, and there are also large outstanding orders. The assets foot up between $500,000 and $600,000; the liabilities are about $300,000.

Electric Heating.[1]

By Carl K. McFadden.

The fact that an electric current when passing through a resisting conductor will generate heat has been known for years. During the past thirty years it has been applied to an ever increasing extent in the manufacture of heating devices used in almost an unlimited number of ways. It remained, however, for the electric street railway to open up the field for heating. The fact that there has been issued during the past two years and a half over eighty per cent. of the total number of patents on heating devices shows conclusively that the influences which have have made themselves felt during the past few years in the general development of electrical apparatus have not left heating behind in the list of improvement.

The first patents issued on electric heaters were taken out in the fifties, and a few years later several were taken out on an oil well heater for melting paraffine and other obstructing material from the bore of oil wells. It appears that after oil has been flowing from a well for some time a large accumulation forms at the bottom which, unless removed, will lessen or completely cut off the supply. Nitro-glycerine was the agent usually employed to loosen up these deposits, but it would seem that an electric heating device in the form of a pointed elongated cylinder would melt out the obstruction, and that this method was used to some extent in the oil regions of Pennsylvania. Patents taken out between 1860 and 1870 show that the idea of placing an electrical conductor in contact with an insulated heat conductor having a relatively lower radiating surface than the electric conductor had been thought of and applied in a number of ways. Burton being probably the pioneer in this class of work. In the patent specifications filed, however, about this date, platinum is spoken of as a conductor, it evidently being thought necessary to raise the wire to quite a high temperature and, therefore platinum was chosen on account of its high melting point.

There are to day in the neighborhood of 150 patents on electric heaters, which alone goes to show that considerable attention has been paid them by the inventors. A very large number of these patents apply to the heating of cars. One of the earliest applications for patents on electric heating apparatus, filed in 1869 by Burton, specifies that one of the largest applications of this particular heater, for which a patent is applied, was that of "heating railway carriages by means of heated metallic plates placed under the feet of passengers." Among the many patents issued will be found some that would seem extremely impractical, one of which is the utilization of a heated platinum wire for cutting down trees, etc, the object of the invention being, as the inventor expresses it, "to accomplish the same ultimate result as that now obtained by the more laborious use of the ax."

There are other patent drawings showing a locomotive whose boiler tubes are filled with a heating device for generating steam. An electric generator is placed on the tender and from appearances would lead one to suppose the generator was to furnish current to heat the water in the boiler, which would generate steam to drive an engine which would be connected with the dynamo, and that the locomotive, therefore, not only moved the train, but also charged the batteries to some extent.

There are a great many other inventions, however, that are extremely practical, and as this branch of work progresses will, no doubt, be brought out and become marketable articles.

To one who has not investigated the remarkable differences in the carrying capacity of a wire when provided with various means of radiating its heat, it will appear astonishing to see a wire carrying safely several times the current that would fuse it in open air. The principle of all well known heaters, is that of placing a good heat conductor, having a large radiating surface, in intimate contact with the electric heating conductor, and there is little doubt, that, inasmuch as nearly all serviceable heaters depend upon this principle, the advantages of one make over another will be more in the line of mechanical details in construction than in efficiency. If the heater is made unusually heavy and contains a large amount of heat conducting material, it will reach its final maximum temperature much slower than one that is built with its heat conductor or reservoir of lighter and thinner material. It may appear immediately after starting both heaters that the latter is more efficient, but if the amount of energy taken up and the radiating surface is the same in both, it will be found that although the heavier heater heats much more slowly than the lighter one, it will hold its heat and remain in a highly heated condition for a longer time after the current is turned off than the lighter heater.

As before mentioned, the electric railway opened up the field for electric heating, the first Sprague road in Richmond, Virginia, being equipped with electric heaters. It has been shown many times that the cost of operating electric heaters on electric roads stands on a par with coal when consideration is made for the value of space that the coal stove generally takes. The electric heaters are generally placed in four or more places in the car, where they will be out of the way of passengers when seated, and in such a position that they will at the same time throw their heat into the body of the car. There has been considerable discussion in regard to the amount of current necessary to keep a car warm in cold weather. Reports from roads operating in Northern Michigan and in other portions of the United States and Canada, where the winters are unusually cold, show that from 1,200 to 1,500 watts is sufficient current to keep the average sixteen-foot car warm in all kinds of weather. It will be seen that inasmuch as the heaters require no attention whatever and are practically a fixture of the car that the cost of maintaining and operating on the average electric road will be simply the cost of current. Coal stoves take from twenty to forty cents per day to operate, if the least account is taken of

1. Read before the Chicago Electric club, May 15, 1893.

time used to keep them in heating condition. The coal stove also take up room for one or more passengers while it remains in the car, which, on a road doing a good business, is a very important item. Coal stoves, too, on cold days, when being heated unusually warm, become so hot that it is often impossible to stand immediately in front of the stove without burning the clothing of the person standing near. Twice within the last few months it has come within my notice that the tops of coal stoves, such as are used in electric cars, are generally in a condition to burn clothing. It is a very natural thing for a man to lean against the guards around the top of these coal stoves, and it generally results in a tailor bill, which, although the railroad company may not have to pay, at the same time is nothing in favor of a stove necessarily run at a temperature which will burn wearing apparel.

The electric heaters being placed under the seats out of the way, and furnishing a lower temperature, cannot be objected to on this score, and being entirely out of the way of passengers, and taking up no space in the car which can be utilized to bring in dividend, often saves in a day more than the entire cost of the current furnished them for the day's run.

There are many times in spring and fall when the mornings and evenings are cool and the middle of the day warm, when a heated car for a few hours each day would add greatly to the comfort of passengers. With coal stoves this is often impossible, unless the car can be taken out of service long enough to have a fire rebuilt in the stove. The many testimonials received from the officials in charge of some of the largest roads cannot leave one in doubt as to the way the public appreciates this method of heating.

If we assume that the only cost of running electric heaters is that of the extra amount of coal burned at the power house, there is no opportunity for argument as to the cheaper method of heating electric railway cars, even when not taking into consideration the convenience and gain in car space by the use of electric heaters, but if the engineer's time has to be figured in for additional attention to engines and dynamos for current for electric heaters, why not figure in a portion of the conductor's time, who oftentimes is called on to take care of his stove while on the run, even though a man be stationed at the terminal point whose special business it is to oversee the heating.

The total cost of one net horse power at the engine on a plant with an average output of 500 electrical horse power is about six-tenths of a cent per hour. The cost of an electrical horse power hour will be found in this same plant to be about one cent. It will be seen from these figures that the total cost of operating electric heaters will be in the neighborhood of two cents per hour.

I believe that it is just as fair to both sides of the question to assume that the fireman and engineer will not be called on for nearly as much additional work to furnish current for electric heaters as the street car conductor and other helpers whose time is wholly or partly taken up in attending to coal stoves. On one road which has come under the notice of the writer a man is paid $1.50 a day to take care of stoves on fourteen cars. This man has no other work to do, with the exception of oiling a few switches near his work. I understand that the man works twelve hours a day and that the cars run twenty. We may assume that there is at least from 10 to 15 cents a day spent in labor in tending these stoves, the conductor's time not being included. The cost of coal in such a stove will be in the neighborhood of 20 cents when operating twenty hours a day, at coal at $8 per ton. The stove used is open to the same objections that all coal stoves have on electric cars. I assume that electric heaters on these cars could without doubt lower the cost of heating. Under the conditions as they now stand on this road the cost of heating during the past winter was far less than in the preceding winter. In many instances coal has to be carried from the power station or some other point to the terminus of the line where the cars lay over before starting on their trips. This hauling should be taken in as an item of expense connected with the use of coal stoves.

Street railway companies seldom take account of the cost of operating the two series of incandescent lamps usually found in lighting street railway cars. This lighting takes at least one third of the energy which might be used for heating.

In a great many estimates which have been made in regard to the cost of coal stoves on electric roads, items have been left out which, when added to the cost of the coal, will bring the actual cost of heating a car on a cold winter day at about the figures to heat the same car by means of electricity. The average life of a street car stove is about three years, and the repairs on even the best make of stoves will be found to amount to a considerable sum before the stove is ready to be abandoned. It also takes time to put these stoves in position and to remove them at the end of the season. It is a well known fact that there are few cars heated by means of stoves that do not have a layer of dust deposited in the car each time the stove is filled or shaken.

A deposit of ashes and coal dust five or six times a day on a finely upholstered car soon starts the foundation for an upholsterer's bill, which, of course, on a road equipped with electric heaters should be a smaller item of expense than on a stove heated road.

Much has been said in the past in regard to burn-outs and other difficulties which occur in the use of electric street car heaters. I believe, however, that with the experience gained in this line by those who have made this branch of work a specialty, the failures from such causes as have made trouble in the past will be practically unheard of in the future.

It is by no means an unheard-of thing for a coal stove to set barns or cars on fire; a thing which with a properly installed electric heater would be impossible to occur. When properly installed they can not possibly injure wood work in the car by excessive heat. There are few street railway companies using stoves for heating that do not find the cost of extra finishing and painting each year, caused by scorched varnish and wood work around the stove pipe as it leaves the car, to be such as to make quite an additional item to the maintenance of car bodies.

Where power is cheap and coal is dear, which is a condition often met with in mountainous districts supplied with water power, electricity will necessarily play quite a part in heating.

A Pelton water wheel when running under a large head of water, such as is met with in the western mountainous districts, can be harnessed to a little mountain stream and develop enough current to heat and furnish power for a small factory with practically no cost, except attendance and depreciation of cost of machinery.

Under such conditions as these electricity could be used to great advantage for heating purposes, even quite a distance from the generating station. There are other places in the West where power is guaranteed the year round at $10 per horse power from turbines. These figures may, of course, be exceptionally low compared with water power in the Eastern states and, at the same time, I might say that there are many places in the West where even $10 per horse power would be considered a high figure, power being obtained the year round at from $6 to $9 per horse power, delivered at the turbine. Many mines in the West are equipped with large water powers and could use electric heating to great advantage in keeping certain exposed portions of the power plant at a comfortable temperature. This branch of work has been taken up to some extent already and, inasmuch as the mine equipped with water does not depend on coal for its motive power, any coal used for heating would cost even more in the quantities in which it would be purchased than if it was used by the mine for steam generation. In many mines, too, it is out of the question to put in heating apparatus which gives out any gases which might be injurious to the workmen. In a vast majority of cases it is of course, impossible for this reason to use a coal stove, and entrances to mines and other exposed places down in the mine itself are not heated because it is considered an impossibility.

Since electric heating has been taken up so successfully on electric roads, the fact also presented itself that there would be a large field in cooking devices to be operated by currents of standard voltages to-day used in lighting. A few electric stove companies have at present good lines of cooking utensils, which surely fill every want for reliability, cleanliness and good design. There are many cases, especially in the smaller size cooking utensils, where electricity can compete with coal. A small tea kettle taking 250 watts of current will furnish boiling water in a few moments by the simple turning of a switch. An "afternoon tea" can be given, the cost of current being but a few cents. There would be no need of fires being lit with the necessary dirt and attention; but the cooking utensils could be placed, you might say, on the parlor table with no visible connection to a source of heat with the exception of a silk-covered conducting cord. The use of electricity in the kitchen reduces the art of cooking to a science. It is an easy matter to determine just how many minutes it will take to cook a certain dish with a current of a certain predetermined strength. This method leaves nothing to be guessed at and, of course, the current may be cut off and all expense stopped the instant that the cooking is completed. With coal stoves this is an impossibility and fires have to be started long before you are ready to use them and the waste of fuel goes on even after the work is done. It would be a pleasant thought on winter mornings for the lazy man to know that his kitchen fire was a thing of the past, and tha the fire that would cook his morning meal had been started long before in the power house, it being only a question of throwing a switch and waiting a minute or so for his electric culinary apparatus to be in condition for cooking. The exact pecuniary value of his comfort thus obtained is, of course, mere conjecture and would have to be answered by the man in question.

There are, of course, a vast number of plants throughout the country that will not furnish current at a rate which would allow electric cooking apparatus to be used, provided it was simply a question of coal costing so many cents per hour and electricity a few cents more. There are advantages in the use of electricity for both heating and cooking which must not be ignored. There are a great many places where electric light costs more than gas, and still it is the modern illuminant. It has advantages which gas has not and the public is not slow to take advantage of them, and for this reason more than any other there are few towns of any size that do not have their electric lighting plant, even though a gas plant has already been installed.

For the heating of chemicals and other applications where an exact amount of heat is needed electricity possesses more advantages than any other method of heating, and there is no doubt but that in this particular line electricity will be used to a large extent. For heating water in drug stores, buffets, etc., electricity also should take quite a part. For heating offices and other small rooms in buildings not equipped with steam, electricity, even at current rates of power service, will be found to be far less expensive than one would at first suppose. An office heater, capable of warming a fair sized room, will be found to be not only an extremely satisfactory way of heating from a sanitary point of view, but will, of course, be entirely free from all gases or odors which are inseparable from the gas or coal stoves.

In conclusion, I would say that the field for electric heating seems to be on the eve of development in a sense that will be a surprise to even those laboring in this branch of work. The general public cannot remain long in ignorance of advantages of this method of heating, and although there will be many places where electric heating is an impossibility from a practical standpoint, there will still remain an immense field in which the electric heater will take a firm and permanent hold.

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—EXHIBIT OF DAY'S KERITE, ELECTRICITY BUILDING.

The Lamp Situation.

The latest development in the incandescent lamp controversy is the arrangement between the Sunbeam company and the General Electric company amicably settling the litigation between these concerns. By the terms of this agreement, it is understood that the Sunbeam company and its customers are released from all claims for past damages and are relieved from an accounting. It is also claimed that the Sunbeam company will be permitted under the provisions of the agreement to dispose of the stock on hand, including lamps and material, thus practically closing up the business of that concern, as the arrangement does not provide for a continuance of the manufacture and sale of lamps. The agreement between the Sunbeam and General Electric companies does not in any way affect the Star Electric Lamp company, it is said, and the latter company will continue the manufacture and sale of the "New Sunbeam" lamp. Possibly this arrangement marks the beginning of a new policy on the part of the General Electric company toward the other lamp manufacturers.

Death of Moses G. Farmer.

The entire electrical fraternity will read with genuine regret the announcement of the death of Moses G. Farmer at Chicago, May 25th. Prof. Farmer had attained the age of seventy-three years and enjoyed the reputation of being one of the pioneers in the field of theoretical and applied electricity. In spite of his advanced years he was ever alert to the progress that was being made in his favorite and chosen profession and this fact brought him to Chicago, that he might be nearer the great electrical display at the World's Fair, to which he was a contributor. He made Chicago his temporary home last October and was so delighted with its advantages that he resolved to remain permanently. Although a confirmed invalid and confined to an invalid's chair, for he suffered a stroke of paralysis in his left side five years ago, his mind was most keen until the last. The immediate cause of his death was pneumonia, induced by a severe cold contracted a few days before his death. The portrait presented is reproduced from one taken a few years ago and which is considered an excellent likeness.

As a man he was beloved by all who knew him. Of a philanthropic disposition, he spent the greater portion of his income for benevolent objects, and of his kindly disposition many remain to speak with gratitude.

His wife was also known for her practical charities. She endowed a home for mothers and children at Eliot, Me., the Farmers summer home, and with the aid of Prof. Farmer erected a public library in the town. As a scientist, in electrical investigation, it may be said that he was a man ahead of his time. To him is generally awarded the honor of having made the first motor capable of moving a car. He exhibited it on the first electrical railroad known, but it was considered impracticable because of the great expense attending the production of the current by means of batteries. As a scientific toy, however, it attracted considerable attention, and it was first placed on exhibition at Dover and Great Falls, N. H., and at other New England towns and finally at New York. The car was propelled by forty-eight cells of Grove's battery, connected in series and inclosed in a box. In front of this battery box on the car was the electric motor. Although of the most primitive design and construction, it embodied the underlying principles of the motor of to-day.

Subsequently it is claimed for Prof. Farmer that he amazed his neighbors by lighting his house with electricity and in 1852 he invented, made and regularly used an electric cooking stove, whereon he broiled his steaks and chops, during his residence in Boston. However, the most important of his inventions were the fire alarm system, which with some modifications was adopted by Boston and which it retains to the present day, and the solving of the problem of multiple transmission. These discoveries illustrate the inventive genius of the man and the capacity for research which he possessed.

Although the son of a well-to-do farmer and lumberman of the little town of Boscawen, N. H., he was in the strictest sense of the word a self-made man. He began life as a teacher and early developed his inventive qualities. He took up the study of electricity and soon became identified with the projectors of the telegraph line between New York and Boston. After several years in this line of business he was appointed, as the result of the introduction of his system, the superintendent of the Boston fire alarm service, an office which he filled until 1853, when he resigned. After devoting some time to the developing of his electrical ideas, he was induced to become a partner in an electrotyping enterprise. In the financial panic of 1857 the firm lost most of its capital and dissolved. He was selected in 1872 to fill the office of electrician at the United States Torpedo Station, Newport, R. I. He remained in this position over nine years, until in 1881 his health failed him. Despairing of finding relief he settled in Eliot, Me., where he lived until last October.

Although enfeebled in body his mind retained its vigor, and as late as 1891 he secured patents for a system of printing telegraphy in the United States, England and other countries, his intention being to exhibit it at the World's Fair.

Of Puritan parents, through life he was always a constant attendant at the Congregational church. He was a brother-in-law of C. C. Coffin, the war correspondent and author.

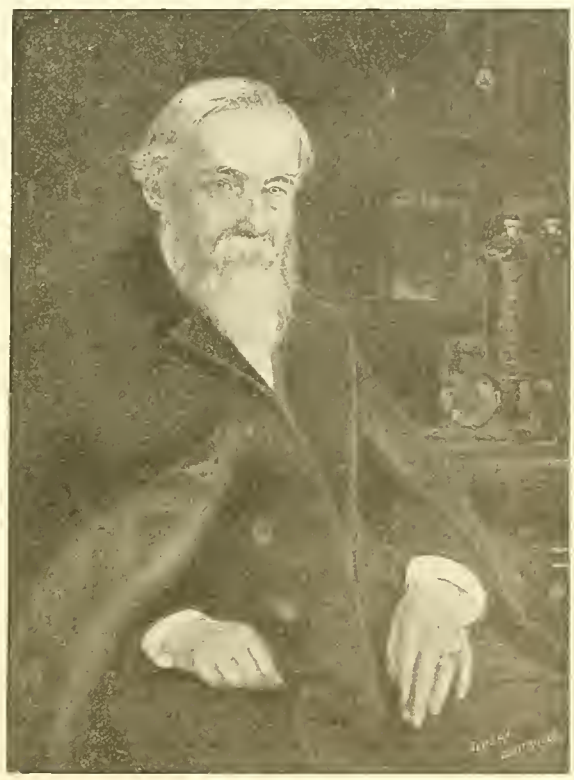
An only daughter, who faithfully acted as nurse, aid and amanuensis during his illness, survives him. The funeral services were held Monday last at the church of Edward Everett Hale in Boston and the burial followed at Eliot, Me.

Charged With Criminal Libel.

The grand jury of New York has returned an indictment against B. E. Greene of New York, charging him with criminal libel in publishing an article in the issue of *Electricity*, dated May 17th, under the title: "Mr. Coffin's Admissions.—The General Electric Company Has Failed to Meet Some of its Obligations Promptly, and is Not in Easy Financial Condition."

The article purported to be correspondence between a director of the General Electric company and President Coffin of that concern, in which the former interrogated the latter about the condition of the company and its management. In Mr. Coffin's reply as printed in the article in question it is complained that the word "first" should have been "fifth." As printed, Mr. Coffin is made to admit that the company has been disturbed in loans and refused accommodations, and that it has failed to meet obligations promptly, whereas, if he had been correctly quoted, he would have been represented as answering that the "company is in perfectly easy financial condition." It is claimed on the part of the General Electric company that the change was made with the intention of conveying to the public a wrong impression of the company's financial condition. It is claimed that the correct version of this letter had appeared several days before in the daily papers.

Concerning the case, Mr. Greene of *Electricity* says that



MOSES G. FARMER.

the entire article as it appeared in his paper was copied from a daily paper, and that his intention in reproducing it was merely to present the facts as he understood them to be. Mr. Greene has been admitted to bail in the sum of $1,000.

Gas Engines for Electric Lighting.

In a communication to the London *Electrician* J. A. McMullen says that, as consulting engineer, to two central stations about to be put down, he is endeavoring to procure a type of gas engine which will be steady enough to work alternators in parallel, even at light loads. Discussing the present types of gas engines on the market the correspondent says:

For this purpose the single-cylinder, single-acting type of engine, working on the Otto cycle, governed by cutting-out explosions, is manifestly unsuitable, and gas-engine manufacturers who are simply relying on high speeds and heavy fly wheels are clearly not on the right road to success. It is possible in central stations of small size to arrange for the mechanical coupling of the alternators, but this would probably be found impracticable on a large scale. For working alternators, even of the best type, in parallel it is certainly necessary that each engine should have at least two impulses per revolution.

Totally regardless of this, most of the chief manufacturers advertise their single-cylinder, single-acting engines as perfect for dynamo driving, thereby utterly ignoring that system of electrical distribution which is more used than any other, and which these so-called perfect engines are totally incapable of driving successfully. There is but little difficulty with direct current dynamos helped by accumulators, but gas engine manufacturers are very blind to their own interests if they continue to ignore alternating current working, as they are at present doing.

Even for direct currents, high speeds and heavy fly-wheels are a disadvantage, for they mean excessive wear and tear and liability to break-down, which should be avoided if possible. Could the difficulty of stuffing boxes be overcome (and one firm appears to have succeeded in this), the adding of an extra single-acting cylinder tandem fashion would give one impulse per revolution, and would double the power of an engine without increasing the size of its connecting rod, main bearings and other parts in front of the cylinders. Two such tandem engines coupled would give two impulses per revolution. A twin-cylinder, double-acting engine gives two impulses per revolution, as would also a tandem engine with double-acting cylinders. This latter type would have great advantages. The connecting rod, main bearings, etc., need not be larger than those for an ordinary engine one-quarter the size, so the engine should be a cheap one in capital cost, and should have a high mechanical efficiency.

This difficulty of stuffing boxes seems to me capable of solution by passing cooling water through the piston rod. I can imagine several ways in which this could be arranged. It is certainly in the direction of quadrupling the number of impulses that manufacturers should work, if they wish their engines ever to be used in alternating current central stations. Not only this, but governing down to at least half load must be performed by varying the power of explosions, and not by cutting them out altogether.

Boynton Bicycle Road.

The members of the Thomson Scientific society of Lynn recently entertained Hon. E. Moody Boynton, who talked to the members about his bicycle railway and its operation by electricity.

The question of questions at the present day is rapid transportation, said Mr. Boynton. Economy is secured by water routes where the cost is seldom more than one mill a ton per mile, but the demands for more rapid transportation seriously threatens the supremacy of the water routes. To-day Boston and the principal cities of Europe and America are as devoid of rapid transit as Egypt at the dawn of civilization. The light engine of Ericsson and Stephenson, which could run as fast as the average train now runs, has been increased in weight until we carry 20 pounds of timber and iron in palace cars and 10 pounds in crowded ordinary cars to every pound of paying weight of passengers carried. On long routes across the continent the weight and waste are so enormous that national railroad bankruptcy is threatened, unless the present extravagant system is changed. But in order to keep the track at high speed efficiency and to obtain the necessary boiler and engine power, weight has been increased, rails, bridges and roadbeds made heavier, until all the great thorough fares are capitalized so heavily that they can be paralleled at one-tenth their cost and entirely swept away by electric rapid transit.

The capital of the railroads of the United States many times exceeds that of the national and savings banks. Any impairment will bring on a financial convulsion and possibly a revolution. I believe that the controllers are conscious that a great change is pending. These roads are banded together and all individual building of steam railroads has ceased. The use of the single rail for the passage of trains on standard gauge railways has been my especial study. We constructed near New York an experimental railroad out of an abandoned standard gauge road so that no practical engineering should go without attention. It was an old surface road elevated for one mile and surface for three quarters of a mile. The curves were so many that it had been abandoned and stage coaches substituted. At an expense of $100,000 we repaired it and equipped it with my single rail bicycle engines and cars, and in three years we have run 27,000 trains, carried 100,000 passengers safely, smoothly and at three times the speed of standard gauge engines. With an expenditure of five pounds of coal per mile we move three cars containing seats for 324 passengers. I used veneer and steel in the construction of the cars, each of which contains 18 compartments seating six persons each. They are entered from the side like a hack. One brakeman opens and closes the doors of two cars by a lever without leaving his position. Not an accident of any kind has taken place in the three years. These cars are stiffer and stronger than any others, on account of their compartments and special construction with steel and veneers. Where the sheets of the veneer come together in the compartments no strain is observed in stopping the train when running 70 miles an hour. There has been scarcely any wear and tear of the working parts when rounding the sharpest curves. Electricity should be used. If electric energy from coal is between 40 and 50 per cent if applied electrically, and 80 per cent by steam, the difference will be more than made up by the saving in weight. My largest engine contains an eight foot driving wheel with a 14 inch stroke. Nearly two strokes are made to the present ordinary 11 ton engine's one. My first bicycle electric motor car has wheels five feet in diameter, turning on spindles, one at each end of the car, which is sharpened to cleave the atmosphere. The field and armature are in and on the wheel and it can turn the sharpest curve. If a road of sufficient length were completed the first motor could run at the rate of 200 miles per hour.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or anyof its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

AT last three evenings a week—Tuesday, Thursday and Saturday—have been officially designated by the authorities of the World's Fair as occasions on which "special evening entertainments" will be given and the grounds thrown open to the public until 11 P. M. This is good as far as it goes, but we are at a loss to know why the directors, while they were about it, didn't extend the rule and make it include every week-day evening. We are hopeful that this will ultimately be done, however, to the great satisfaction of the public generally and in justice to those engaged in making the electrical display.

AS THE time draws near for the gathering of electrical scientists from all parts of the world at Chicago to participate in the World's Electrical Congress, there is a general awakening of interest in the work to be presented to the delegates. The proposed programme, which is presented elsewhere in this issue, will be read with interest. In this connection the article appearing on another page, in which E. Hospitalier discusses several propositions which are offered for the consideration of the congress, is timely. No doubt the views presented will receive the careful consideration of the delegates.

ONE by one the pioneer investigators who delved in the field of applied electricity in the first half of the century are dropping away. The latest to lay down the burden of life is Moses G. Farmer, some account of whose achievements are given on another page. Mr. Farmer was a faithful and conscientious worker in the field of electricity, and many of his inventions have permanent value. He was notable for his efforts to produce a practical electric motor, and forty years ago he succeeded in running a car by a motor which does not differ greatly in principle from the motors in use to-day. Mr. Farmer leaves behind him a record of achievement that should serve as an inspiration for many an ambitious young electrician.

THE commanding proportions and graceful outlines of the "tower of light" in electricity building, illustrated on the first page of this week's issue, will linger in the memory of the visitors to the exposition as one of the most fascinating spectacles in that great aggregation of wonders known as the World's Fair. With its five thousand colored lights, presenting changing designs in outline and color, and the great crystal lamp surmounting all and flooding the atmosphere with sparkling, iridescent light reflected from many thousand facets of cut glass, the sight at night cannot fail to make a lasting impression on all beholders. The department of electricity is to be congratulated on the possession of such a beautiful and striking display.

ELECTRIC heating forms the subject of paper presented in this issue in which the topic is pretty thoroughly discussed. It seems to be the general opinion that the advantages of this form of dispensing heat will in many cases overcome the objection which is based upon the expense of installation and maintenance. There is no doubt that in many cases this cost may be materially lessened by improvements in apparatus, etc., and where current is furnished for light and power as well as heating, the manifold advantages of the system will quite off-set the additional expense. But the advocates of the system are not content with this. They claim that electric heating will be quite generally introduced, that improvements in the devices and new forms of heaters will make the application much more economical, and that the history of the development of electric lighting will be repeated in the case of the electric heater. It is to be hoped, however, that the projectors of the electric heater will guard against the error which their predecessors made. Extravagant claims by irresponsible salesmen of electric lighting apparatus in the early days of the art caused no end of trouble for those who followed. Even to-day the prejudice against electric light and power apparatus is often displayed by those who were so unfortunate as to be the victims of the exploiters of the pioneer systems of electric lighting. In view of the experience gained in electric lighting and the electric railway, it is to be hoped that the projectors of heating apparatus will follow a conservative policy. Thus far they have been content to present only such claims as might be substantiated by data of authentic experiments. The electric heater will undoubtedly win its way into public favor if this course is followed.

INVESTIGATION of the charges recently preferred against ex-Commissioner Simonds, of the Patent Office, and Foster & Freeman, attorneys for the American Bell Telephone company, has been commenced at Washington. It will be remembered that the allegations were in general that through the connivance of Messrs. Simonds, Foster and Freeman and Chief Clerk Benoett copies of certain records in the Drawbaugh telephone case, presumably in the secret archives of the Patent Office, had been unlawfully inspected and copied by persons outside of the office in the interest of the Bell Telephone company. Immediately upon the publication of the charges the attorneys mentioned in the complaint entered an emphatic denial of the charges and expressed a willingness to co-operate with the government in bringing the case to speedy trial. Mr. Simonds' denial is no less emphatic. Concerning the specific charges that have been presented against him the ex-commissioner says in his defense:

> This complaint makes specific mention of copies given of only two Drawbaugh applications, one filed in 1880 and the other filed in 1884. If both had been pending applications, it would have been no offense in law or good morals to have given copies of them. So much the courts have decided. But as a matter of fact the whole matter was treated in strict accordance with the rules of the office. The 1880 application was not a pending application; it was a dead and abandoned application, and a copy of it was properly given under rule 179 and form 52. The 1884 application was treated as a pending application and the copy was denied. My decision is published in the *Gazette* of April 4, 1893.

He pronounces the other charges "false, outrageous and defamatory both in substance and in detail." The attorney-general has notified the commissioner of patents that owing to the pressure of public business it will be impossible for him to delegate an officer of his department to conduct the investigation. This is certainly to be regretted. The investigation should be conducted under official sanction and by representatives of the government, and access to records of the Patent Office should be had in order to make the inquiry complete and the decision final. The people are interested directly in this investigation, the standing of a powerful corporation conducting a public business and enjoying peculiar privileges under the government is affected, the reputation of prominent attorneys and a former official of the government is attacked. But above all and of paramount importance is the fact that the integrity of an important branch of the public service is brought into question. In view of these facts it would appear that the attorney-general should take cognizance of the proceedings and give the investigation an official character. If the charges are sustained and if it be shown that the Patent Office has been used unlawfully, the public should know the facts and the department thoroughly reorganized; if, on the other hand, the charges cannot be sustained, the acquittal of the persons against whom the charges have been preferred should receive official endorsement and be given all the weight that this implies. At any rate the investigation should be conducted thoroughly and with expedition.

SUPPLEMENTARY consular reports received at Washington recently furnish additional proof of activity in several lines of electrical work abroad. The latest advices from Berlin announce that public interest at the German capital is centered in the experiments conducted by two Belgian scientists who are developing a system of electric heating and welding and the refining of metals by electricity. Messrs. Lagrange and Hoho in March last exhibited their new system of welding in practical operation before the Electro-technical Society of Berlin and, according to the United States consul whose report describes the experiments, the demonstration was thoroughly satisfactory. The apparatus employed is described as consisting of a "glass or porcelain vase provided with a lining of lead connected with a strong conductor of positive electricity. The vase is filled to three fourths its capacity with acidulated water. A pair of iron tongs with insulated handles is attached by a flexible conductor to the negative pole of an electrical current generated by an ordinary dynamo." With this equipment the following phenomenon is produced: "The electrical current having been switched on, a bar of wrought iron or other metal is taken up with the tongs and plunged into the water within the vase. Immediately the water begins to boil at the point of contact; the immersed portion of the iron rises quickly to a red, then to a white, heat, and emits a stream of brilliant white light. In a few moments the heat becomes so intense that the iron melts and falls off in bubbles and sparks, leaving a clear, glowing surface in perfect condition for welding. The heating process has been so rapid that neither the water nor the end of the bar held within the tongs have been more than slightly warmed, and, the current being switched off the bar with its submerged end glowing, may be held in the naked hand." It was estimated at Berlin that fully fifty per cent. of the current was directly utilized as heat. There are many advantages claimed for this process, which, of course, can only be determined by practical application to commercial work. It is said that Krupp & Co. have become interested in the process and have established an experimental plant at their works.

Another interesting report is presented by the United States consul at Buda-Pesth, who describes the operation of the electric railway at that point as giving satisfaction to the people. It has now been working three years. Seven miles of track, upon which sixty cars are operated, are equipped with an underground conduit system. It is noted that the only interruption in the service was caused by unusually heavy falls of snow.

From Pekin the United States minister furnishes some interesting facts about the Chinese land telegraph system, which has been joined to the Russian system. The Chinese system now reaches Helampo in the north, where the connection is made with the Russian lines; Aichow, in Hainan, in the south; Wenchuen, in Kirin, in the northeast; Takao, in Formosa, in the southeast; Suchan, in Kansu, in the northwest; and Zengyueh, close to the Burmah frontier, in the southwest. The only province which is not reached by telegraph is Hunan, which still remains opposed to all foreign innovations. There are 147 stations scattered throughout the principal provinces. The service is satisfactory, but the rates are still very high, and this probably explains to a great degree the fact that the telegraph has not yet come into general use.

On the whole the reports are extremely interesting to Americans, particularly at this time, when the entire world is afforded an opportunity to compare American methods and apparatus with those of other countries.

Propositions for the Consideration of the Electrical Congress.[1]

By E. Hospitalier.

As a sequel to the article published in our last issue[2] on the rules of electrical nomenclature, we present herewith a table which groups the principal physical quantities that interest electricians, the symbols which we propose to represent them in formulæ, the defining equation of each of these quantities, the dimensions of each in the C G. S. system and in addition the names of the C. G. S. units and the practical units used to designate them. We could wish to have added to the table two special columns for fundamental and practical standards; but this matter, from an international point of view, involves such difficulties that it has seemed prudent to reserve it.

Fundamental Quantities and Units.—Despite therecent excellent works of Ruecker, Ostwald, Williams and others there is no reason to modify the system of C. G. S. magnitudes and units adopted by the International congress of 1881, and expanded and completed by subsequent congresses.

Geometric Quantities and Derived Units.—No change or addition is proposed. The names, definitions, units of fundamental magnitudes, and of geometric magnitudes of the C. G. S. system are so well known that it seems useless to reproduce them in the table.

Mechanical Quantities and Derived Units.—No change is proposed, but a single addition is suggested which relates to a physical quantity frequently appearing in calculations upon dielectrics and magnetic phenomena. This quantity is the ratio of an energy to a volume. We propose to call it volumic [volumique] energy in order to suggest its origin from the two quantities which appear in its definition. It is equivalent to a pressure and may be designated by the same symbol (p). Its C. G. S. unit is the erg multiplied by the cubic centimeter.

Magnetic Quantities and Derived Units.—We propose an addition as a designation for a quantity called specific magnetism and defined as the ratio of the magnetic moment of a magnet to its mass. There should be created a special symbol if the practical use of this physical quantity is to be extended. Reluctance is the name proposed as a substitute for the expression "magnetic resistance," and the corresponding coefficient will be reluctivity. These two terms correspond to resistance and resistivity. To be logical the word permeance, corresponding to conductance, must be adopted, and permeability, which is today universally adopted, should be preserved; there seems to be no reason to change it to inductivity. Permeance is the converse of resistance and reluctivity the converse of permeability. We propose the adoption of these expressions suggested by Guillaume, as their logical formation has the advantage of introducing method in the coinage of new expressions.

Electrical Quantities and Units.—In accordance with the suggestion of C. E. Guillaume there is reason for the systematic adoption of the termination "ance" for physical magnitudes which do not constitute properties of matter and which vary with mass or dimensions, and for reserving the termination "ity" for properties of matter. Specific resistance then becomes resistibility or resistivity; conductivity the converse of resistance, becomes conductance, and what is called specific conductivity is simply conductivity. In carrying these changes to the extreme limit, the name capacity would be applied to what has been called hitherto dielectric constant inductive capacity or specific inductive capacity, and actual capacity would assume the name of capacitance.

TABLE OF THE PRINCIPAL SYMBOLS OF PHYSICAL QUANTITIES AND ABBREVIATIONS OF UNITS PREPARED FOR THE ELECTRICAL CONGRESS.

Physical Quantities.	Symbols.	Defining Equations.	Dimensions of the Physical Quantities.	Names of C. G. S. Units.	Practical Units.	Abbreviations of the Practical Units.
Velocity	v	$v=\frac{L}{T}$	LT^{-1}	Centimeter per second.	Meter per second.	m/s
Angular velocity	ω	$\omega=\frac{v}{L}$	T^{-1}	Radian per second.	Revolutions per minute.	t/m
Acceleration	A	$A=\frac{v}{T}$	LT^{-2}	Centimeter per second per second.	Meter from second to second	m/s²
Force	F	$F=M.A$	LMT^{-2}	Dyne	Gramme; Kilogramme.	g; kg
Energy or work	W	$W=F.L$	L^2MT^{-2}	Erg.	Kilogrammeter.	kgm
Power	P	$P=\frac{W}{T}$	L^2MT^{-3}	Erg per second.	Kilogrammeter per second	
Volumic energy	"	$\nu=\frac{W}{V}$	$L^{-1}MT^{-2}$	Erg per cubic centimeter.		
Pressure	p	$p=\frac{F}{S}$	$L^{-1}MT^{-2}$	Dyne per square centimeter.	Kilogramme per square centimeter.	kg/cm²
Moment of a couple	W	$F.L$	L^2MT^{-2}	Dyne-centimeter.	Kilogrammeter.	kgm
Moment of inertia	K	$M.L^2$	L^2M	Gramme-mass-centimeter squared		
Strength of pole	m	$F=\frac{m^2}{L^2}$	$L^{\frac{3}{2}}M^{\frac{1}{2}}T^{-1}$			
Magnetic moment	$\mathfrak{M}$	$\mathfrak{M}=ml$	$L^{\frac{5}{2}}M^{\frac{1}{2}}T^{-1}$			
Intensity of magnetization	$\mathfrak{I}$	$\mathfrak{I}=\frac{\mathfrak{M}}{V}$	$L^{-\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$			
Specific magnetism	"	$\frac{\mathfrak{M}}{M}$	$L^{\frac{5}{2}}M^{-\frac{1}{2}}T^{-1}$			
Intensity of field	H	$H=\frac{F}{m}$	$L^{-\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$			
Magnetic flux	Φ	$\Phi=H.S$	$L^{\frac{5}{2}}M^{\frac{1}{2}}T^{-1}$			
Magnetic induction (density of flux)	$\mathfrak{B}$	$\mathfrak{B}=\mu\mathfrak{H}$	$L^{-\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$			
Permeability	μ	$\mu=\frac{\mathfrak{B}}{\mathfrak{H}}$	A number.		Kilogrammeter.	kgm
Susceptibility	κ	$\kappa=\frac{\mathfrak{I}}{\mathfrak{H}}$	A number.		Kilogrammeter.	kgm
Reluctivity	ρ	$\rho=\frac{1}{\mu}$	A number.			
Reluctance	$\mathfrak{R}$	$\mathfrak{R}=\rho\frac{L}{S}$	L^{-1}			
Permeance	$\mathfrak{P}$	$\mathfrak{P}=\frac{1}{\mathfrak{R}}$	L			
Resistance	R, r	$R=\frac{E}{I}$	LT^{-1}		Ohm.	o
Conductance	"	$\frac{1}{\mathfrak{R}}$	$L^{-1}T$		Mho.	mho
Electromotive force	E	$E=RI$	$L^{\frac{3}{2}}M^{\frac{1}{2}}T^{-2}$		Volt.	v
Intensity of current (current strength)	I	$I=\frac{E}{R}$	$L^{\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$		Ampere.	A
Quantity of electricity	Q	$Q=IT$	$L^{\frac{1}{2}}M^{\frac{1}{2}}$		Coulomb; Ampere-hour.	c; A.h
Capacity	C	$C=\frac{Q}{E}$	$L^{-1}T^2$		Farad.	F
Linear capacity	"	$\frac{C}{L}$	$L^{-2}T^2$		Microfarad per kilometer.	
Electric energy	W	$W=EIT$	L^2MT^{-2}		Joule; Watt-hour.	J.; w.h
Electric power	P	$P=EI$	L^2MT^{-3}		Watt; kilowatt.	W. kw
Resistivity	α	$\alpha=\frac{RS}{L}$	L^3T^{-1}		Ohm-centimeter.	o cm
Conductivity	γ	$\gamma=\frac{1}{\alpha}$	$L^{-2}T$			
Linear insulation	"	$\alpha=RL$	L^2T^{-1}		Megohm-kilometer.	
Co-efficient of self-induction	L_s	$L_s=\frac{\Phi}{I}$	L		Henry	h
Co-efficient of mutual induction	L_m	"	L		Henry.	h
Magnetizing force	$\mathfrak{H}$	$\mathfrak{H}=\frac{4\pi NI}{L}$	$L^{-\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$			
Magnetomotive force	$\mathfrak{F}$	$\mathfrak{F}=4\pi NI$	$L^{\frac{1}{2}}M^{\frac{1}{2}}T^{-1}$		Ampere turn	a t

The C. G. S. magnetic and electro-magnetic units have not received special names. They are designated by writing "C. G. S. units" after the formula.

1. *L'Industrie Electrique.*
2. See the Western Electrician, May 20, 1893.

But in spite of the rationality of such a change we would not dare to propose it, for it would modify too greatly expressions universally adopted.

To avoid all confusion, we propose to call the ratios of the capacity of a line to its length, which is measured practically in microfarads per kilometer, linear capacity; we propose to call the product of the insulation resistance of a line by its length, linear insulation; and to call the ratio of the resistance of a line to its length the linear resistance. The expressions formerly used, viz., kilometric capacity, kilometric insulation, and kilometric resistance, present the disadvantage of introducing a unit into the definition of a physical quantity, thus preventing coherence in the definition, and necessitating a change in it when the units are changed. We can not too often repeat

that definitions of physical quantities are and should be independent of units.

We propose to reserve the name of co-efficient of self-induction for a magnitude equivalent to a length and defined as the ratio of a flux of force to the strength of current that produces it. There should be created special names to designate the secondary phenomena resulting from the variation of magnetic permeability, the quantities entering into which are equivalent to a coefficient of self-induction. The discussion instigated in the International Society of Electricians by Blondel and Boucherot will certainly lead to an understanding on this point.

The agreement to substitute the name Henry for the word quadrant to designate the practical unit of the co-efficient of self-induction will be unanimous.

In view of the difficulty of creating a coherent system of practical magnetic units it seems useless to employ other units than the C. G. S. units and to give them special names. There is no reason for using the words, gilbert weber, gauss and oersted proposed by the American Institute of Electrical Engineers to designate respectively magnetomotive force, magnetic flux, magnetic induction and magnetic resistance.

Alternating Currents.—We group here all the decisions made or to be made in respect to establishing an international terminology for alternating currents.

The periodic time or period is the interval which separates two passages in the same direction past the zero point or the interval between two alternations. Frequency is the converse of periodic time; it is measured in periods per second. It will be convenient to create a special word to designate the factor $\omega = \frac{2\pi}{T}$ which is equal to 2π times the frequency. J. A. Fleming calls it pulsation. The congress could sanction this designation without going amiss.

The effective current is the square root of the mean square of the current.

The effective difference of potential is the square root of the mean square of the potential difference.

When a circuit is the seat of a periodic electromotive force, and the elements are a resistance R, self-induction L, and a capacity C, the effective current which traverses the circuit is equal to the ratio of the effective electromotive force to a factor called impedance. By designating by ω, 2π times the frequency or pulsation we have the general relation.[1]

$$I\ eff = \frac{E\ eff}{\sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}}$$

The impedance constitutes the entire radical of this expression. We propose to give the name reactance to the factor within the parenthesis, defining it with Boucherot as a quantity equivalent to a resistance which does not absorb energy and the square of which added to the square of the resistance gives the square of the impedance.

The reactance due to self induction is the product of the pulsation and the co-efficient of self-induction.

The reactance due to capacity is the converse of the product of the pulsation and capacity.

When there is at the same time self-induction and capacity the reactance of the whole is the difference of the two reactances.[2]

The name reactance has the advantage over the designation inductance of being more generally applicable to the actions of induction and capacity.

We do not see the necessity of adopting the expression impressed electromotive force proposed by the American Institute of Electrical Engineers and defined as the ratio of the total activity in an electrically conducting circuit to its instantaneous current strength. With M. Meylan we fail to realize the usefulness of this new term.

Polyphase Currents.—The definitions proposed by the American Institute of Electrical Engineers lack exactness and should be modified. It is proposed to call simple alternating currents those in which there is practically only a single phase. The meaning of this definition wholly escapes us, for an alternating current in one period passes by all the phases of which it is susceptible. On the other hand a simple alternating current generator feeding many derived circuits of which the reactances are different will produce many currents whose phases will not be in harmony.

The discordances of phase of diphase or triphase alternating currents are to be expressed not in degrees but in fractions of a period.

The expression polyphase should be applied not merely when there are more than three currents, but also to diphase and triphase currents.

There is room to complete these propositions by adding observations relating to photometry, but the question does not seem far enough advanced to warrant us in formulating these matters.

All the Denver, Colo., cable street railroads will ultimately be transformed to electric lines. The Broadway and the Colfax avenue lines of the Tramway company will soon be altered, and the Denver Cable company expects to have its new plant in operation in a few days.

Work was begun last week by the Union Railroad company on the new shore electric road, which is to connect East Providence, R. I., with Bullock's Point and intermediate stations. The introduction of the trolley system on the east shore of Narragansett bay is not only hailed with delight by the residents along the line, but by the entire population of Providence. The road, when completed, will open a new pleasure resort, Crescent Park, which will undoubtedly be a source of much profit to the company and considerable gratification to Providence pleasure seekers.

Light and Other High Frequency Phenomena.[1]

By Nikola Tesla.

PART I.

When we look at the world around us, on nature, we are impressed with its beauty and grandeur. Each thing we perceive, though it may be vanishingly small is in itself a world, that is, like the whole of the visible universe, matter and force governed by law—a world, the contemplation of which fills us with feelings of wonder and irresistibly urges us to ceaseless thought and inquiry. But in all this vast world, of all objects our senses reveal to us, the most marvelous, the most appealing to our imagination, appears no doubt a highly developed organism, a thinking being. If there is anything fitted to make us admire nature's handiwork, it is certainly this inconceivable structure, which performs its innumerable motions in obedience to external influence. To understand its workings, to get a deeper insight into this nature's masterpiece, has ever been for thinkers a fascinating aim, and after many centuries of arduous research men have arrived at a fair understanding of the functions of its organs and senses. Again, in all the perfect harmony of its parts, of the parts which constitute the material or tangible of our being, of all its organs and senses, the eye is the most wonderful. It is the most precious, the most indispensable of our receptive or directive organs; it is the great gateway through which all knowledge enters the mind. Of all our organs it is the one which is in the most intimate relation with that which we call intellect. So intimate is this relation that it is often said that the very soul shows itself in the eye.

It can be taken as a fact, which the theory of the action of the eye implies, that for each external impression, that is for each image produced upon the retina, the ends of the visual nerves concerned in the conveyance of the impression to the mind must be under a peculiar stress or in a vibratory state. It now does not seem improbable that, when by the power of thought an image is evoked, a distinct reflex action, no matter how weak, is exerted upon certain ends of the visual nerves, and therefore upon the retina. Will it ever be within human power to analyze the condition of the retina when disturbed by thought or reflex action by the help of some optical or other means of such sensitiveness that a clear idea of its state might be gained at any time? If this were possible, then the problem of reading one's thoughts with precision, like the characters of an open book, might be much easier to solve than many problems belonging to the domain of positive physical science, in the solution of which many, if not the majority, of scientific men implicitly believe. Helmholtz has shown that the fundi of the eyes are themselves luminous, and he was able to see, in total darkness, the movement of his arm by the light of his own eyes. This is one of the most remarkable experiments recorded in the history of science, and probably only a few men could satisfactorily repeat it, for it is very likely that the luminosity of the eyes is associated with uncommon activity of the brain and great imaginative power. It is fluorescence of brain action, as it were.

Another fact having a bearing on this subject which has probably been noted by many, since it is stated in popular expressions, but which I cannot recollect to have found chronicled as a positive result of observation, is that at times, when a sudden idea or image presents itself to the intellect, there is a distinct and sometimes painful sensation of luminosity produced in the eye, observable even in broad daylight.

The saying, then, that the soul shows itself in the eye, is deeply founded, and we feel that it expresses a great truth. It has a profound meaning even for one who, like a poet or artist, only following his inborn instinct or love for nature, finds delight in aimless thoughts and in the mere contemplation of natural phenomena, but a still more profound meaning for one who, in the spirit of positive scientific investigation, seeks to ascertain the causes of the effects. It is principally the natural philosopher, the physicist, for whom the eye is the subject of the most intense admiration.

Two facts about the eye must forcibly impress the mind of the physicist, notwithstanding he may think or say that it is an imperfect optical instrument, forgetting that the very conception of that which is perfect, or seems so to him, has been gained through this same instrument. Firstly, the eye is, as far as our positive knowledge goes, the only organ which is directly affected by that subtile medium which, science teaches us, must fill all space; secondly, it is the most sensitive of our organs, incomparably more sensitive to the external impressions than any other.

The organ of hearing implies the impact of ponderable bodies, the organ of smell the transference of detached material particles, and the organs of taste and of touch or force the direct contact or at least some interference of ponderable matter, and this is true even in those instances of animal organisms, in which some of these organs are developed to a degree of truly marvelous perfection. This being so, it seems wonderful that the organ of sight solely should be capable of being stirred by that which all our other organs are powerless to detect, which yet plays an essential part in all natural phenomena, which transmits all energy and sustains all motion and, that most intricate of all, life, but which has properties such that even a scientifically trained mind cannot help drawing a distinction between it and all that is called matter. Considering merely this, and the fact that the eye, by its marvelous power, widens our otherwise very narrow range of perception far beyond the limits of the small world which is our own, to embrace myriads of other worlds, suns and stars in the infinite depths of the universe, would make it justifiable to assert that it is an organ of a higher order. Its performances are beyond comprehension. Nature as far as we know never produced anything more wonderful. We can get barely a faint idea of its prodigious power by analyzing what it does and by comparing. When ether waves impinge upon the human body, they produce the sensations of warmth or cold, pleasure or pain, or perhaps other sensations of which we are not aware, and any degree or intensity of these sensations, which degrees are infinite in number, hence an infinite number of distinct sensations. But our sense of touch or our sense of force cannot reveal to us these differences in degree or intensity, unless they are very great. Now we can readily conceive how an organism, such as the human in the eternal process of evolution, or, more philosophically speaking, adaptation to nature, being constrained to the use of only the sense of touch or force, for instance, might develop this sense to such a degree of sensitiveness or perfection that it would be capable of distinguishing the minutest differences in the temperature of a body even at some distance, to a hundredth or thousandth or millionth part of a degree. Yet even this apparently impossible performance would not begin to compare with that of the eye, which is capable of distinguishing and conveying to the mind in a single instant innumerable peculiarities of the body, be it in form or color or other respects. This power of the eye rests upon two things, namely, the rectilinear propagation of the disturbance by which it is affected, and upon its sensitiveness. To say that the eye is sensitive is not saying anything. Compared with it, all other organs are monstrously crude. The organ of smell which guides a dog on the trail of a deer, the organ of touch or force which guides an insect in its wanderings, the organ of hearing, which is affected by the slightest disturbances of the air, are sensitive organs, to be sure, but what are they compared with the human eye! No doubt it responds to the faintest echoes or reverberations of the medium; no doubt, it brings us tidings from other worlds, infinitely remote, but in a language we cannot as yet always understand. And why not? Because we live in a medium filled with air and other gases, vapors and a dense mass of solid particles flying about. These play an important part in many phenomena; they fritter away the energy of the vibrations before they can reach the eye; they too are the carriers of germs of destruction; they get into our lungs and other organs, clog up the channels and imperceptibly yet inevitably arrest the stream of life. Could we but do away with all ponderable matter in the line of sight of the telescope, it would reveal to us undreamt-of marvels. Even the unaided eye, I think, would be capable of distinguishing in the pure medium small objects at distances measured probably by hundreds or perhaps thousands of miles.

But there is something else about the eye which impresses us still more than these wonderful features which we observe, viewing it from the standpoint of a physicist, merely as an optical instrument—something which appeals to us more than its marvelous faculty of being directly affected by the vibrations of the medium, without interference of gross matter, and more than its inconceivable sensitiveness and discerning power. It is its significance in the processes of life. No matter what one's views on nature and life may be, he must stand amazed when, for the first time in his thoughts, he realizes the importance of the eye in the physical processes and mental performances of the human organism. And how could it be otherwise, when he realizes, that the eye is the means through which the human race has acquired the entire knowledge it possesses, that it controls all our motions, more still, all our actions.

There is no way of acquiring knowledge except through the eye. What is the foundation of all philosophical systems of ancient and modern times, in fact of all the philosophy of man? *I am, I think; I think, therefore I am.* But how could I think and how would I know that I exist, if I had not the eye? For knowledge involves consciousness; consciousness involves ideas, conceptions; conceptions involve pictures or images, and images, the sense of vision, and therefore the organ of sight. But how about blind men, will be asked? Yes, a blind man may depict in magnificent poems forms and scenes from real life, from a world he physically does not see. A blind man may touch the keys of an instrument with unerring precision, may build the fastest boat, may discover and invent, calculate and construct, may do still greater wonders —but all the blind men who have done such things have descended from those who had seeing eyes. Nature may reach the same result in many ways. Like a wave in the physical world, in the infinite ocean of the medium which pervades all, so in the world of organisms, in life, an impulse started proceeds onward, at times, may be, with the speed of light, at times, again, so slowly that for ages and ages it seems to stay, passing through processes of a complexity inconceivable to men, but in all its forms, in all its stages, its energy ever and ever integrally present. A single ray of light from a distant star falling upon the eye of a tyrant in bygone times may have altered the course of his life, may have changed the destiny of nations, may have transformed the surface of the globe, so intricate, so inconceivably complex are the processes in Nature. In no way can we get such an overwhelming idea of the grandeur of Nature, than when we consider, that in accordance with the law of the conservation of energy, throughout the Infinite, the forces are in a perfect balance, and hence the energy of a single thought may determine the motion of a universe. It is not necessary that every individual, not even that every generation or many generations, should have the physical instrument of sight, in order to be able to form images and to think, that is, form ideas or conceptions; but sometime or other during the process of evolution, the eye certainly must have existed, else thought, as we understand it, would be impossible; else conceptions, like spirit, intellect, mind, call it as you may, could not exist. It is conceivable that in some other world, in some

1. A lecture delivered before the Franklin Institute at Philadelphia February 24, 1893, and before the National Electric Light association at St. Louis, Mo., March 1, 1893.

other beings, the eye is replaced by a different organ, equally or more perfect, but these beings cannot be men.

Now what prompts us to all voluntary motions and actions of any kind? Again the eye. If I am conscious of the motion, I must have an idea or conception, that is, an image, therefore the eye. If I am not precisely conscious of the motion, it is because the images are vague or indistinct, being blurred by the superimposition of many. But when I perform the motion, does the impulse which prompts me to the action come from within or from without? The greatest physicists have not disdained to endeavor to answer this and similar questions and have at times abandoned themselves to the delights of pure and unrestrained thought. Such questions are generally considered not to belong to the realm of positive physical science, but will before long be annexed to its domain. Helmholtz has probably thought more on life than any modern scientist. Lord Kelvin expressed his belief that life's process is electrical and that there is a force inherent to the organism and determining its motions. Just as much as I am convinced of any physical truth I am convinced that the motive impulse must come from the outside. For, consider the lowest organism we know—and there are probably many lower ones—an aggregation of a few cells only. If it is capable of voluntary motion it can perform an infinite number of motions, all definite and precise. But now a mechanism consisting of a finite number of parts, and few at that, cannot perform an infinite number of definite motions, hence the impulses which govern its movements must come from the environment. So, the atom, the ulterior element of the universe's structure, is tossed about in space eternally, a play to external influences, like a float in a troubled sea. Were it to stop its motion it would die. Matter at rest, if such a thing could exist, would be matter dead. Death of matter! Never has a sentence of deeper philosophical meaning been uttered. This is the way in which Prof. Dewar forcibly expresses it in the description of his admirable experiments, in which liquid oxygen is handled as one handles water, and air at ordinary pressure is made to condense and even to solidify by the intense cold—experiments, which serve to illustrate, in his language, the last feeble manifestations of life, the last quiverings of matter about to die. But human eyes shall not witness such death. There is no death of matter, for throughout the infinite universe all has to move, to vibrate, that is, to live.

I have made the preceding statements at the peril of treading upon metaphysical ground in my desire to introduce the subject of this lecture in a manner not altogether uninteresting, I may hope, to an audience such as I have the honor to address. But now then, returning to the subject, this divine organ of sight, this indispensable instrument for thought and all intellectual enjoyment, which lays open to us the marvels of this universe, through which we have acquired what knowledge we possess, and which prompts us to, and controls, all our physical and mental activity—by what is it affected? By light! What is light?

We have witnessed the great strides which have been made in all departments of science in recent years. So great have been the advances that we cannot refrain from asking ourselves: Is this all true, or is it but a dream? Centuries ago men have lived, have thought, discovered, invented, and have believed that they were soaring, while they were merely proceeding at a snail's pace. So we too may be mistaken. But taking the truth of the observed events as one of the implied facts of science, we must rejoice in the immense progress already made and still more in the anticipation of what must come, judging from the possibilities opened up by modern research. There is, however, an advance which we have been witnessing, which must be particularly gratifying to every lover of progress. It is not a discovery, or an invention, or an achievement in any particular direction. It is an advance in all directions of scientific thought and experiment. I mean the generalization of the natural forces of phenomena, the looming up of a certain broad idea on the scientific horizon. It is this idea which has, however, long ago taken possession of the most advanced minds, to which I desire to call your attention and which I intend to illustrate, in a general way, in these experiments, as the first step in answering the question "What is light?" and to realize the modern meaning of this word.

It is beyond the scope of my lecture to dwell upon the subject of light in general, my object being merely to bring presently to your notice a certain class of light effects and a number of phenomena observed in pursuing the study of these effects. But to be consistent in my remarks it is necessary to state that according to that idea, now accepted by the majority of scientific men as a positive result of theoretical and experimental investigation, the various forms or manifestations of energy which were generally designated as "electric" or more precisely "electro-magnetic" are energy manifestations of the same nature as those of radiant heat and light. Therefore the phenomena of light and heat and others besides these may be called electrical phenomena. Thus electrical science has become the mother science of all and its study has become all important. The day when we shall know exactly what "electricity" is will chronicle an event probably greater, more important than any other recorded in the history of the human race. The time will come when the comfort, the very existence perhaps, of man will depend upon that wonderful agent. For our existence and comfort we require heat, light and mechanical power. How do we now get all these? We get them from fuel, we get them by consuming material. What will man do when the forests disappear, when the coal fields are exhausted? Only one thing, according to our present knowledge will remain; that is, to transmit power at great distances. Men will go to waterfalls, to the tides, which are the stores of an infinitesimal part of nature's immeasurable energy. There will they harness the energy and transmit the same to their settlements, to warm their homes by, to give them light, and to keep their obedient slaves, the machines, toiling. But how will they transmit this energy if not by electricity? Judge then, if the comfort, nay, the very existence, of man will not depend on electricity. I am aware that this view is not that of a practical engineer, but neither is it that of an illusionist, for it is certain that power transmission, which at present is merely a stimulus to enterprise, will some day be a dire necessity.

It is more important for the student, who takes up the study of light phenomena to make himself thoroughly acquainted with certain modern views, than to peruse entire books on the subject of light itself, as disconnected from these views. Were I therefore to make these demonstrations before students seeking information—and for the sake of the few of those who may be present, give me leave to so assume—it would be my principal endeavor to impress these views upon their minds in this series of experiments.

It might be sufficient for this purpose to perform a simple and well-known experiment. I might take a familiar appliance, a Leyden jar, charge it from a frictional machine, and then discharge it. In explaining to you its permanent state when charged and its transitory condition when discharging, calling your attention to the forces which enter into play and to the various phenomena they produce, and pointing out the relation of the forces and phenomena, I might fully succeed in illustrating that modern idea. No doubt, to the thinker, this simple experiment would appeal as much as the most magnificent display. But this is to be an experimental demonstration, and one which should possess instructive as well as entertaining features, and as such a simple experiment, like the one cited, would not go very far toward the attainment of the lecturer's aim. I must therefore choose another way of illustrating, more spectacular certainly, but perhaps also more instructive. Instead of the frictional machine and Leyden jar, I shall avail myself in these experiments of an induction coil of peculiar properties, which was described in detail by me in a lecture before the London Institution of Electrical Engineers, in February, 1892. This induction coil is capable of yielding currents of enormous potential differences, alternating with extreme rapidity. With this apparatus I shall endeavor to show you three distinct classes of effects, or phenomena, and it is my desire that each experiment, while serving for the purposes of illustration, should at the same time teach us some novel truth, or show us some novel aspect of this fascinating science. But before doing this, it seems proper and useful to dwell upon the apparatus employed, and method of obtaining the high potentials and high frequency currents which are made use of in these experiments.

General Electric Company's New Street Railway Motor.

The new motor known as "G. E. 800" which the General Electric company has just placed on the market, and which is illustrated in the accompanying cuts, is a four-pole motor, the principal characteristic of which is that it is a lighter street railway motor for a given output than has been heretofore employed. The matter of reduction of weight has been studied with considerable care, and this motor is even lighter than the 15 horse power motor formerly sold by the General Electric company. In suspending the motor on the cross frame of the truck it will be so hung that only 500 pounds of its weight will bear directly on the axle. From this it will readily be seen that the dead blow delivered from the axle to the truck is greatly reduced when comparison is made with the work of other motors.

The working parts are easily accessible, as seen by reference to Fig. 1, which presents a front view. The aperture necessary for the purpose of inspection, cleaning, etc., is so designed that, when closed, those parts which could be damaged by water, the brush holders, commutator, armature and field spools, are so entirely enclosed in a water-tight box that the entire motor could be immersed in water and still operate as under normal conditions. This closing of the motor so as to make it water and dust-proof has been rendered possible by its superior design and the liberal use of copper and the best grade of steel in its construction, whereby the heat generated in the motor has been materially reduced. The motor, even closed up as it is, a representation of which is given in the side view, Fig. 2, runs much cooler than previous motors that were entirely exposed. It can be taken apart with the utmost facility. The top frame is hinged on the lower frame, and with its proper parts weighs only 350 pounds. On the removal of only two bolts it can be thrown back completely out of the way of the armature, or by the removal of the hinge pins the top frame can be lifted into the car, or by moving the nose plate forward the motor can be swung upon the ring axle as a hinge, so as to be accessible from the pit, the top field then being swung on its hinges still lower into the pit, in which position the armature and field spools can be easily removed; or by the removal of the top of the gear case and two axle caps the motor can be lowered as a whole into the pit. The armature is short and can be lifted through an ordinary trap door. It will thus be seen that the motor can be handled either inside the car or from without with almost equal facility. On opening the lid over the commutator easy access is had to the whole width of the commutator and brush holders, the latter being of the simplest possible construction, and easily operated. There is also plenty of space to permit of the pit of the motor being reached. The construction is such that it is practically impossible for any grease to get inside of the motor.

The armature is similar to that used on the W. P. motors, and is made both in the Gramme ring armature and in the drum form. The drum winding has been carefully studied, and the many objections to the various kinds of drum windings that have from time to time been put upon the market have been carefully guarded against. A thorough trial has demonstrated that the drum winding of this motor can be relied upon. It will be free from the danger of burning out at the ends, heretofore common with this kind of winding. The Gramme armature and drum armature are interchangeable.

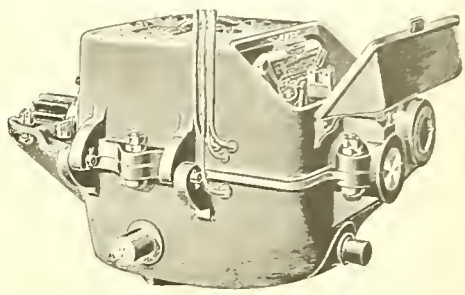

FIG 2. GENERAL ELECTRIC COMPANY'S NEW STREET RAILWAY MOTOR.

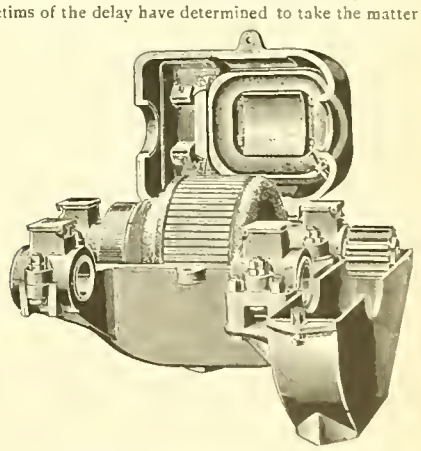

FIG. 1. GENERAL ELECTRIC COMPANY'S NEW STREET RAILWAY MOTOR.

CORRESPONDENCE.

New York Notes.

NEW YORK, MAY 27.—It is a healthy sign that the citizens of New York are beginning to indicate an intention to formulate a practical protest against the farce that has been carried on under the pretence of providing rapid transit for the city. The people of the upper portion of the city have become thoroughly aroused on the subject, and have resolved to hold a mass meeting on Monday night at Madison Hall to give expression to their sentiments regarding the course thus far taken by the Rapid Transit commission. The meeting is expected to take the form of an immense popular demonstration, and will be addressed by some of the leading citizens. The failure of the negotiations between the Rapid Transit commission and the Manhattan Railway company leaves the matter of rapid transit in the same position that it occupied when the commission was first appointed, and the long suffering victims of the delay have determined to take the matter in their own hands, and by an overwhelming popular expression give the public an opportunity to know just where they stand at the present juncture. It is understood that resolutions will be passed at the meeting asking for the resignation of certain members of the commission. This demonstration will be strongly supported by the most influential section of the city press. The *Sun* has not hesitated to charge J. H. Starin and E. L. Bushe, members of the commission, with being actuated by improper or misunderstood motives in standing out against the requests of the Manhattan company, and a monster petition is being circulated up town, and generally signed, asking the mayor to remove the two commissioners on the grounds "of incompetence and neglect of duty, and for failure to perform the duties of their office." and to appoint in their place "men competent and

willing to faithfully, and with reasonable expedition and economy, perform the duties of the Rapid Transit commission for this city, who will act in the interest of the people only." Various new schemes may be expected to be placed before the commission. One of these has already been outlined, and is said to be backed by Thomas Breen. Mr. Breen proposes a viaduct, and is ready to prove his good faith by showing his ability to control $10,000,000, and to deposit with the city as a guaranty of the performance of any contract he may undertake $1,000,000 in cash. He proposes to build a six-track railway, two tracks for local business, two for express business, and two for freight, and to erect elevators at each station to carry passengers from the street. The road is to cost $95,000,000, and to extend from the Battery to Peekskill. Although the road would carry heavy engines, they would condense their steam and burn their own smoke, and the assurance is given that occupants of adjoining property would not be annoyed by the noise or concussion of the trains.

The arbitration on the question of extra fare on the special World's Fair train to Chicago was closed yesterday. A decision was rendered requiring the New York Central to charge but $6 extra on this train, which is $4 less than was originally proposed. Persons who desire to go to Chicago on this twenty hour train, therefore, will be obliged to pay $31 each way. That figure includes the regular first-class fare of $20, the Wagner sleeping-berth fare of $5 and the extra fare of $6. At 3 o'clock tomorrow afternoon the "Expositson flier" will start on its first regular trip, and is scheduled to reach Chicago about 10 o'clock on Monday forenoon.

An epidemic of strikes among electrical workmen seems to have set in. The workmen in the Thomson-Houston Electric Works have demanded fifty-eight hours' pay for a week of fifty-four hours. The manager of the works posted a proposition to the men that they should work nine hours a day, including Saturday, or ten hours five days a week and a half-holiday Saturday, and he refused to pay the same wages for shorter time. A mass meeting of the men held on Thursday night was unanimously in favor of insisting on their first demands. It is said that unless these demands are conceded, a general strike involving 4,000 men will be ordered.

When the strike of the employes of H. Ward Leonard & Co. occurred two weeks ago, the Electrical Contractors' association, which employs nearly five hundred men, informed the union that if the strike were not declared off the members of the association would discharge all the union men. As the strike continued, the association advertised in several of the morning papers for non-union men. The situation, as defined by Mr. Leonard, is said to be as follows: The association has made up its mind to employ non-union men. After the strike a year ago, a contract was entered into between the firms and the union, the terms of which could not be terminated without six months' notice in writing. In this contract the association was permitted to retain the non-union men employed during the strike. It was also agreed that all disputes between men, bosses and contractors should be settled by arbitration. Now the union leaders decline to arbitrate, and repudiate their contract. In order to test the action of the association they decided to strike, and about two weeks ago ordered the men out. The major part of the linemen, however, finding they had no support among other trades, declined to go out. The leaders of the union now wait the association to discharge the non-union men who were employed during the strike a year ago, and also to discharge men who are in arrears to the union. The whole trouble seems to arise not from a difficulty of wages or hours, but simply that the union has found that the contract is not all that was expected of it, and it wants to terminate it and have a new one without waiting the full six months. In advertising for non-union workmen, the association indicates its intention of running its business in spite of intimidation in the future.

An incident occurred recently that shows the omnipresence and industry of the representatives of the daily press. A meeting of the Laryngological section of the Academy of Medicine was held on Thursday evening. At the meetings of the respective sections of the Academy it is the custom for some member to read a paper or make a few remarks on a subject likely to be of special or timely interest, and on this occasion Dr. Wendell Phillips, a leading authority on the treatment of the throat, nose and ear, showed the assembly what could be done in the way of throwing the rays of an electric light into different parts of the head, so that morbid processes could be detected. The speaker thought his audience was restricted to his professional brethren, innocent that among them was "a chiel takin' notes." A reporter had strayed in, and the next morning the *Sun* had a paragraph telling of the wondrous way in which the cheeks and eyes of a boy who had been experimented upon. It was only a few lines, but it was quite enough to bring an inundation of reporters to the consulting room of the unfortunate doctor, who little knew the hornets' nest he had got into. He told them the simple story of transillumination by means of the electric lamp, as it has been long practiced by the medical profession, but the various versions of the process that were detailed in the evening papers did more credit to the ingenuity of the reporters than to their scientific accuracy. The doctor has had a rough time at his clinic, of which he stands at the head, ever since, and his coadjutors twit him, half in joke and half in earnest, with laying a trap for an advertisement. Fortunately, however, his reputation places him above any such suspicion. He is known to be a conscientious worker, alive to the importance of the most approved scientific methods in electro-therapeutics, and that a wide-awake press has been the means of bringing that fact into prominence outside the circle for which his remarks and illustrations were intended can only be regarded with satisfaction. W. F. O.

Northwestern Notations.

MINNEAPOLIS, May 27.—Supt. C. P. Waisman of the Northwestern Telephone company will visit Grand Forks, N. D., with the view of investigating the feasibility of constructing a line that shall afford Reynolds and other towns on the Great Northern line telephone connection with that city. Supt. Waisman estimates the cost of construction at $100 per mile.

The formal opening of the electric street car line at Brainerd, Minn., occurred recently. Citizens tendered C. N. Parker, the owner, an ovation, and were in turn given a trip over the three and a half miles of road with a band in attendance. The line runs from the south end of Sixth street to Rice Lake, where the Northern Mills company's works are located, and which is also the terminus of the Brainerd & Northern Minnesota railroad. The proprietor has expended $50,000 in the construction of the line.

More discharges in the Western Union Telegraph offices in Minneapolis and St. Paul has caused commotion. Fifteen operators have been dismissed during the past two months. Various reasons are given and rumored. In some cases the report that it was due to union matters is denied by the company's officials, who say that the men's work is not satisfactory.

A movement to put in a telephone system at Little Falls, Minn., is again being made. Thomas Bailey is taking an active part in the work. He expects to obtain 50 subscribers at $3.50 a month each.

It has been suggested that it would be an excellent idea to put ten or a dozen arc lights on the top of the big chimney being erected at the new electric light power house at Duluth. It is claimed that that number of lights on the smokestack would light not only the harbor and railroad yards in that vicinity, but the canal as well, and would serve as an excellent beacon light for vessels at night.

The Brush Electric company of Minneapolis is increasing its plant at Third avenue north and the river, and has awarded the Cooley & Vater company of this city the contract for installing a 1,200 horse power compound condensing Corliss engine, which will be the largest engine, it is believed, in the Northwest.

The citizens of Minneapolis are to be provided with ample and increased street car facilities this summer. The company has had built 85 open cars and 30 new cars for the interurban line. The new cars will be somewhat larger than the ones now in use and constructed after the most approved modern pattern, being attractive in appearance and having all the modern conveniences.

Anoka, Minn., is having trouble with the company that supplies the place with light and water, and it is expected that a bill of $3,000 for such services will be contested in the courts. The company is controlled by Mr. Sykes of Minneapolis.

A large number of people gathered at the store adjoining the electric light office at Great Falls, Mont., in response to an invitation from Superintendent Dickenson to witness a practical trial of electric cooking and heating apparatus. Among the different utensils to be seen in operation were a bake oven, broiler, chafing dish, stew pan, tea kettle, coffee pot, tea pot, pancake griddle, heating disc, water heater, flat-iron, curling iron, sewing machine motor, fan motor, glue pot and a room heater. The experiments were all successful and aroused great interest.

Another stage has been reached in the legal fight between the Winnepeg Street Railway company and the electric railway company which has recently commenced operations. The former, which has been established for the last ten years, claims to have been given exclusive rights to the streets by the city council. The first case came before the Court of Queen's Bench, which decision was favorable to the new electric company. An appeal was taken to the full Supreme Court of Manitoba, the judges of which unanimously ruled that the city council had no power to grant a monopoly of the streets, and holding that the new company could not be interfered with. The solicitors of the defendant corporation at once filed notice that they would take an appeal to the privy council of England. The new company includes among its directors President Van Horne of the Canadian Pacific road.

Both branches of the St. Paul local legislature have finally passed a street railway ordinance, which seems to be a solution of the situation. The mayor has signed it, and all that remains is the approval of the street car people. It is believed that they will accept it. The only change from the last ordinance is a requirement that the East Seventh street cable be changed to an electric line and be joined with the West Seventh street line by September 1, 1895, and the further requirement that the Maria avenue line shall be operated to Robert street by that date. As President Lowry has indicated a desire to do this, it is presumed that the amendments will be satisfactory.

Work has been begun on the electric light building at Spring Valley, Minn.

A Minneapolis alderman has a proposition which he threatens to bring before the council. He proposes to tax street cars at the rate of $25 per car annually. There are 619 cars now in operation, and this proposition, if it goes through, will cost the company annually $15,475.

The Red Wing Gas & Electric Light company has elected the following named officers: President, T. B. Sheldon; vice-president, John Hack; secretary and treasurer, W. H. Putnam; general manager, J. C. Pierce; superintendent, John Nelson.

The new electric plant at Cumberland, Wis., works well, and there is talk of extending the wires over the entire city.

The Livingston, Mont., Electric Light company is arranging to consolidate its water and steam power plants. An addition to the power house west of the city will be erected at once.

Motorman Charles Engdahl of West Superior, Wis., has been arrested charged with criminal negligence amounting to manslaughter. The warrant was sworn out by the relative of a child that was run over and killed. Engdahl is held at $1,000 bail.

The Waseca, Minn., city council has ordered a special election for voting on a proposition to bond the city for an electric light plant. The sentiment of the city is almost unanimously in favor of the project, it is stated.

At Chippewa Falls, Wis., the jury in the case of A. Johnson against the Wisconsin Telephone company brought in a verdict in favor of the plaintiff and awarded damages to the amount of $9,258.73. The suit was to recover damages for a barn that was burned. A bolt of lightning followed one of the wires, which was strung over the roof of the barn. The case was tried twice before, but the jury disagreed.

The council at Valley City, N. D., has passed an ordinance granting a twelve-year electric light franchise to Amundson & Sandbeck. The plant is to be put into operation within six months, and if not the franchise will be revoked.

At La Crosse, Wis., material has been received and preparations have been made for transforming the street car system from horse power to electricity. The Thomson-Houston system has been adopted and the power plant will have two dynamos of 135 horse power each, and they will be of the multipolar type. The cars have been made by the St. Louis Car company, and are ready for shipment. N. L. P.

PERSONAL.

President Elias E. Ries, of the Ries Electric Specialty company of Baltimore, was a visitor at the New York office of the WESTERN ELECTRICIAN last week.

M. M. Hayden, of the Laws Battery company of New York, left last week on an extended tour through the West, in the interest of his company. He will not return until fall.

Ralph L. Shainwald, president of the Standard Paint company, New York, is now in Chicago. Mr. Shainwald is visiting the World's Fair and combining business with pleasure.

Secretary H. M. Nichols, of the Redding Electric company of Boston, Mass., was in New York last week on a trip through that state, where he closed several large orders for the many specialties which this company manufactures.

J. B. Wethrell, who has been an assistant to Lieut Badt, in the mining department of the western office of the

General Electric company, has accepted a position with the Chicago Edison company and is now associated with L. A. Ferguson in isolated lighting work.

The electrical fraternity will be interested to know that C. A. Daigh has accepted a position as general sales agent for the Siemens & Halske Electric company. Mr. Daigh's headquarters will be at the Chicago office of the company in the Monadnock building. The Siemens & Halske company is to be congratulated upon obtaining so energetic and pushing a man as Mr. Daigh.

J. A. Seely, C. O. Baker and C. A. Bragg of New York are planning a dinner of the planked shad style as a compliment to James I. Ayer of St. Louis, who is expected East in a few weeks, as a small recognition of the many courtesies extended to eastern men in St. Louis at the recent electric light convention, when he was the president of the association. The dinner will take place at Gloucester, N. J.

NEW INCORPORATIONS.

Boulder Electric Power company, Creighton, Neb., and Independence, Mont.; capital stock, $500,000; to do a general electric power business.

Electrical & Mechanical Manufacturing company, New York, N. Y., capital stock, $15,000; to manufacture and sell electrical and mechanical apparatus.

College Hill Electric Railway company, Cincinnati, O.; capital stock, $10,000; building and operating an electric railway; C. B. Matthews, Cincinnati, O.

Towanda Traction company, Towanda, Pa.; capital stock, $42,000; constructing and operating an electric railway in Bradford county, Pa.; James H. Codding, Towanda, Pa.

Bar Harbor Electric Light company, Portland, Me.; capital stock, $75,000; to manufacture and deal in gas and electricity for heat, light and power; H. and H. B. Cleaver, Portland, Me.

Electrical Supply & Construction company, Kansas City, Kan.; capital stock, $10,000, to buy, sell, handle and manufacture supplies, equipments and appliances for electric light, power, etc.

Hillsboro Water, Light & Power company, Hillsboro, Tex.; capital stock, $50,000; to supply the public with light and power by electricity and also with water; D. M. Crosthwait, Hillsboro, Tex.

Peoria Street Railway company, Peoria, Ill.; capital stock, $100,000; to build, operate and maintain electric street railway in the county of Peoria, Ill.; Arthur Keithley, 205 Y. M. C. A. building, Peoria, Ill.

Electric Light & Power company of Sayre, Pa., Sayre, Pa.; capital stock, $3,000; furnishing light, heat and power by electricity to the public in Sayre, Bradford county, Pa.; H. F. Maynard, Athens, Pa.

Tioga Point Electric Light & Power company, Athens, Pa.; capital stock, $3,000; furnishing light, heat and power by electricity to the public in Athens, Bradford county, Pa.; H. F. Maynard, Athens, Pa.

Allegheny Valley Heat, Light & Power company, New Kensington, Pa.; capital stock, $15,000, manufacturing and supplying light, heat or power to the public at New Kensington, Pa.; John T. Reeves, Beaver Falls, Pa.

Mount Pleasant & Hammondville Electric Street Railway company, Mount Pleasant, Pa.; capital stock, $18,000; constructing and operating an electric railway in Fayette county, Pa.; I. J. McWilliams, Mount Pleasant, Pa.

Calkins Electric Burner company of Illinois, Chicago, Ill.; capital stock, $120,000; to manufacture and deal in heating and cooking apparatus and appliances, to operate oil wells, refine, use and sell oil, etc; Warren & Cox, 115 Dearborn street, Chicago, Ill.

Red Bank Electric Light & Power company, Red Bank, N. J.; capital stock, $50,000; to purchase, construct, maintain and operate works for the supply and distribution of electricity for electric light, heat and power, etc.; George M. Lane, Asbury Park, N. J.

Beverly & Edgewater Park Electric Light & Power company, Beverly, N. J.; capital stock, $30,000; to construct, maintain and operate works for the supply and distribution of electricity for electric light, heat and power George M. Lane, Asbury Park, N. J.

Muncie Electrical Railway company, Muncie, Ind.; capital stock, $200,000; constructing, maintaining and operating by means of electricity or other motive power, lines of street railway in Muncie, Ind., and in neighboring cities and towns, and also to dispose of electricity for lighting, power and other purposes; Muncie Electrical Railway company, Muncie, Ind.

ELECTRIC LIGHTING.

Washington, N. J., is to have an electric light plant.

Port Washington, Wis., is to be lighted by electricity.

The Mountain Electric company will put in a plant to light the city of Trinidad, Colo.

The people of Danvers, Mass., have authorized the common council to put in a municipal lighting plant.

Iroquois, Ont., suffered the loss of its electric light plant a few weeks ago. The loss is estimated from $6,000 to $10,000, covered by insurance.

The city council of Rome, N. Y., has instructed the mayor to appoint a committee of three to investigate as to the advisability of establishing a municipal electric light system.

Edgewater, N. Y., has advertised for bids for lighting the streets for one year from sunset to sunrise, New York City schedule, with incandescent lamps of 25 candle power or gas of the same power.

Representatives of various electric companies having plants in Hyde Park, Chicago, called upon the commissioner of public works and the corporation counsel last week and notified them that they had agreed among themselves to take down all the poles in the district except one line on each street. The agreement was ratified by the corporation counsel.

ELECTRIC RAILWAYS.

An electric railway is projected from Falls Church to Washington, D. C.

An electric road is to be built to connect Trenton and Bardentown, New Jersey.

The Oakland avenue line in Lyons, Iowa., is to be equipped for electrical service.

An electric railway for passenger traffic is to be constructed from Douglas to Laxey in the Isle of Man.

An electric railway is projected from Northeast Baltimore to Lake Montebello, a distance of about five miles.

Rights of way are being secured for an electric railway between Youngstown via Hubbard and Brookfield to Sharon, O.

A company has been organized to build an electric railway 12 miles in length to connect Manor, Pa., with outlying towns.

The Houston City, Tex., Street Railway company is to extend its electric lines to the Volksfest grounds, through Lubbock Grove.

The electric system of the Mobile Street Railway company will be completed and the road opened for traffic about August 1st.

A movement is on foot to build an electric railway running from Lenoir, N. C., to Blowing Rock. It is estimated the proposed enterprise will cost $350,000.

It is stated that an electric railroad from Indianapolis to Marysinsville, Ind., a distance of 30 miles, is projected by a company that has filed articles of incorporation.

The Buffalo & Tonawanda Electric Railway company, Buffalo, N. Y., has obtained the right of way to build and operate an electric railway line from Buffalo to Niagara Falls.

The Wissahickon, Pa., Electric Railway company has made a contract for the electric railway to be shortly put into operation in Manayunk, Wissahickon and Roxborough.

The officers of the Sandlake Plank Road company are negotiating with New York capitalists with a view of constructing an electric railway from Albany, N. Y., to Sandlake.

The Delaware & Schuylkill Electric Railway company has applied to the city council for the right to lay tracks in three wards in Philadelphia and to operate the road by the trolley system.

Chas. D. Jones and A. R. Bliss of the Consolidated Electric company have effected an arrangement with the Canada Electric company for the purchase of its entire electrical manufacturing equipment.

The General Electric company has secured the temporary use of the Crescent Beach loop of the Boston and Maine railroad for the purpose of carrying out a series of experiments relative to the application of electricity to steam roads.

The street railway company of Kingston, Ont., is applying to the Ontario Legislature for an amendment to its charter. The company asks for permission to use electricity, to alter its gauge, and to run its lines on new streets.

The Vicksburg Street Railway company, Vicksburg, Miss., and the Hill City Electric Light company have effected a consolidation, which is understood to be a preliminary step towards the building of an extensive system of electric railway.

The county commissioners of Huron county, O., have granted a franchise to the Sandusky, Huron & Milan Electric Railway company, to run a line over the Old State road, between Milan and Norwalk. The line will soon be constructed.

O. L. Bannard of the Continental Trust company of New York has bought the Nashville Electric Railway & Power company plant for $20,000, by order of court in the case of the Detroit Electrical Works against the Nashville Railway & Power company.

An electric belt road will be in running order around the battlefield at Gettysburg by July 1st. Twelve double-decker cars of 60 horse power each, with a trailer, will be put on, and these will be capable of carrying 2,000 people an hour over the field.

It is rumored that Cleveland and Pittsburg capitalists contemplate building an electric railroad to connect Cleveland and Pittsburg. The names of Daniel Peels, Mark A. Hanna and C. F. Brush of Cleveland are mentioned as those of men interested in the enterprise.

The new electric line known as the Buffalo, North Main street and Tonawanda electric railroad has been opened for public use. The officers and directors of the new company are: President, L. F. W. Arend; vice-president, A. T. Fancher; secretary, Edward Rutherford; treasurer Charles C. Mead.

An electric railway will soon be constructed from Stockholm to Djursholm, Sweden. The electric appliances are to be furnished by a firm in Manchester, England, while the boilers and steam engines will be made at Eskilstuna. The work will be pushed so that the line may be opened for general traffic next fall.

The Portland Consolidated Street Railway company, which about a year ago purchased the Portland and Vancouver railway, is having the entire line changed into an electric system. Other changes will be made entailing an aggregate cost of about $100,000. The motors have been purchased from the Northwest General Electric company and the Westinghouse company.

An electric railway is to be built between and through the cities of Dunkirk, Ind., and Redkey. The company building the road proposes to put in an arc and incandescent light plant in each city and contracts to light them with a forty-two thousand candle power plant. The road will be about five miles long and a power station will be erected mid way between the two places.

The Brooklyn, Bath & West End Railroad company, Brooklyn, N. Y., has filed an application with the state railroad commission to change its motive power from steam to electricity on the present line of its steam railroad, and also on its line from 41st street and New Utrecht avenue, in New Utrecht, to 10th avenue and 39th street, Brooklyn, which it will connect with the tracks of the South Brooklyn & Terminal company.

Electric cars have been started on the cross-town lines of the Chicago City Railway company. After several experimental trips the lines were opened for traffic on May 22d. On Forty-seventh street twelve cars run between Cottage Grove and Western avenues. Electric cars are also now running on Sixty-third street. The electric power house is situated in the rear of the cable power-house on State street south of Fifty-second street.

The directors of the Frankford & Southwark Passenger Railway company of Philadelphia have concluded, it is said, that the best and easiest way to get the necessary funds to install the trolley on the 100 miles of road in its system will be to organize a new company under the traction act of 1887, which will absorb and operate the Frankford & Southwark road and its allied lines. Accordingly, application will be made for a charter for the Electric Traction company of Philadelphia. The capital at first will be small, but provision will be made for its increase as needed. The purpose of the new company will be to furnish the funds necessary to equip with the trolley the Frankford and Southwark system. The new company will probably eventually lease the Frankford and Southwark road. This lease will carry with it the Frankford and Southwark's leased and operated lines, the Lehigh avenue, Citizens', Second and Third and Lombard and South. It is estimated that from $6,000,000 to $8,000,000 will be required to install the trolley on the entire system. The funds could have been raised in other ways, such as an additional issue of stock or by bonding the different roads, but the organization of a new company was considered the best method.

POWER TRANSMISSION.

Another company has been incorporated for transmitting power to San Bernardino, Cal. The name of the company is the Consolidated Reservoir & Power company and the capital stock is $1,000,000.

The great electric power transmission plant at Pomona, Cal., is now in successful operation. The generators are driven by direct coupled Pelton wheels, under a head of 400 feet at 600 revolutions per minute, and each generator delivers alternating current at a pressure of 1,000 volts to a bank of transformers by which the initial pressure of the line is raised to 10,000 volts. Circuits of bare copper, carried on special insulators, extend to the towns of Pomona and San Bernardino, the latter being 28 miles distant, where the power is being utilized for lighting and other purposes.

The mountains in Sweden are valuable because of their waterfalls. A large electrical transmission plant of 400 horse power is nearly finished in which a waterfall at Hull-See is utilized by means of four turbines. Two turbines drive dynamos for power purposes, one for electric lighting, the fourth being held in reserve. The distance to the first station is 10 kilometers, a second is 4 kilometers farther, the third is 1 1-2 kilometers still farther, and a fourth is a short distance from this. The second and third distribute the most current both for power and for light.

MISCELLANEOUS.

The electric power house, 527 Third street, Louisville, Ky., was burned May 3d. The loss is $150,000.

The South Yuba Water company is considering the proposition of furnishing Sacramento, Cal., with electric power. A survey has already been made from Roseville to Sacramento.

The electric plant of West St. Paul, Minn., was obliged to suspend operations recently owing to the high water in the Mississippi River. The building of the plant was flooded and damage to some considerable amount was done.

The Twin Cities Rapid Transit company's power house was the scene of a peculiar accident lately. Chas. Warren, chief clerk of General Manager Hield, was paying a visit to James Holstrom, who has charge of the switchboard in the dynamo room. Mr. Holstrom, in explaining lightning

arresters, in some way connected the circuit, blowing out the fuse. Both men were badly burned.

The eighth annual convention of the order of Railway Telegraphers of America opened its session on May 16th, at Toronto, Can. About 250 delegates, representing 253 divisions in the United States, Canada and Mexico were present.

The General Electric company is to build a large electrical factory a short distance from the city limits of Akron, O. This will bring it much nearer its base of supplies, and will be a great saving in freight. Options have been secured on ground, and a belt line railroad will be built to connect the plant with the neighboring railroads. It is understood that nearly 700 men will be employed in the works.

The Thomson-Houston company, Lynn, Mass., is endeavoring to discover the perpetrators of a species of vandalism of the worst class. In several instances it has been discovered that the fire apparatus in the company's factories has been tampered with, the hose cut, and extinguishing machines removed from their proper places. The company is making every effort to discover the authors of these offences, and as the punishment in such cases is five years' imprisonment and $1,000 fine, some one is liable to get into serious trouble.

According to the announcements of the committee having in charge the rebuilding of the Metropolitan Opera House, New York, a novelty in theater construction will be introduced in the shape of electric elevators of large capacity. To make the omnibus tier and the next two above it readily accessible, and practically to make one part of the house as good as another, four large electric elevators are to rise from one of the entrances of the house. They have a capacity of 100 persons a minute. They will stop at the grand tier, the dress circle and the balcony, but will not reach the family circle.

TRADE NEWS

E. C. French, representing the Babcock & Wilcox company of New York, established an agency at Deseronto, Ont., last month.

The address of the New York Electrical & Development company is 251 Williams street, New York City, and not 281 Madison street, as stated in the issue of May 13th.

W. C. McIntire & Co. and H. S. Smith & Co. of Philadelphia, selling agents for the Meston alternating fan motors, report very large sales during the month of May for these fan motors, and have a number of orders on hand for immediate shipment.

The Electric Heat & Alarm company, Boston, Mass., has completed equipping a large factory at Haverhill, Mass., with its system, and received within the past ten days three contracts from other large mills for the installation of its system at the earliest moment.

Owing to the number of electric bells on the market, it is very gratifying to Huebel & Mangen, manufacturers of electrical and brass goods, of Brooklyn, that their bells were placed in the new Hotel Waldorf on Fifth avenue, New York. This company is unusually busy with orders now on hand for its different size bells.

The name "Insullac" has now an associate in the word "Enamelac," which is the name the Massachusetts Chemical company of Boston, Mass., has given to its newly perfected black paint, especially adapted for car trucks, iron poles, conduits, batteries and machinery, and it announces to its friends in the electrical department that it is ready to supply the demand for this article.

Andrew Shillinglaw, of C. E. Woodruff & Co., Chicago, is making his presence felt among purchasers of wire. Fifteen miles of "canvasite" is the last order secured on a recent trip. "canvasite" is a wire with rubber insulation and canvas cover. C. E. Woodruff & Co. find that the trade fully appreciate the merits of this wire.

A circular has been issued to the creditors of the Detroit Electrical Works, requesting them to meet at the office of the company at the Campau Building, Detroit, on June 2d, at 10 o'clock in the morning. At this meeting an endeavor will be made to reach an arrangement by which all the creditors will ultimately secure payment in full.

Treasurer and General Manager H. N. Fenner of the New England Butt company of Providence, R. I., was in New York recently. Mr. Fenner is desirous of stating that the correct location of his company's exhibit at the World's Fair is T 12 electricity building, as some of the electrical papers have incorrectly reported its location.

H. L. Burdick, manager of the New York office of the National India Rubber company of Bristol, R. I., received last week a complimentary letter from Randolph & Sullinger, contractors of that city, who recently wired a seven-story office building on Water street with N. I. R. wire, in which they state that the wire showed a high insulation, notwithstanding the fact that the wire had laid for several weeks in wet plaster.

The following board of directors has been elected for the Electric Selector & Signal company of 45 Broadway, New York: Jennings S. Cox, Wm. E. Tillinghast, John Dougherty, Thomas Sturgis, James Brown Potter, Wm. C. Lane, Charles F. Homer, F. P. Voorhees, James M. Townsend, jr., C. P. Mackie. The officers are: President, Thomas Sturgis; first vice-president, Wm. C. Lane; second vice-president and general manager, C. P. Mackie; treasurer, F. P. Voorhees; secretary, James Brown Potter; general agent, S. S. Bogart.

Many indeed are the types of switches now being introduced, and there is a similarity in a great many of the new productions. When, however, a new switch is brought out that possesses ingenious features of simplicity and reliability in action the device is entitled to examination by users. Such a switch as this is now being manufactured by Cutler & Hammer, 313 South Canal street, Chicago. A personal inspection of this pattern of switch, it is believed, will convince the practical man that this enterprising firm is fully cognizant of the needs of the trade.

Station managers who realize the value of standardized fuse wire may be interested to know that the Wirt fuse wire handled by the Ansonia Electric company, formerly the Electrical Supply company, is standardized wire. The large sales which this company is making of shield brand wire, Stanley transformers and Helios lamps would tend to prove that it is a combination which operators of plants think very highly of. A neat little pamphlet has recently been issued descriptive of the W. W. lightning arrester, which ought to be of interest to every station superintendent or manager.

Word has been received from A. S. Terry, secretary and treasurer of the Star Electric Lamp company, Chicago, to the effect that the new Sunbeam gas lamp is proving its superiority. The Star company calls attention to the peculiarity of this lamp, viz., that it maintains its initial candle power throughout its life. The gas in the bulb has a tendency, the company claims, to build up the filament during the incandescence, and this action prevents the drop in candle power. Orders, Secretary Terry state, are coming in gratifying numbers, and purchasers of the lamp evidently appreciate its valuable features.

The Ries Electric Specialty company of Baltimore is busy getting out a new line of regulating switches for alternating current circuits on the principle of its socket. The new switches are designed to simultaneously control a group of lights on electroliers and other places where the individual lamps are arranged along the ceiling or are otherwise out of reach. They are being made in sizes varying from one to ten lights capacity, and larger sizes are in course of construction. They operate on the reaction principle, no current wasting resistance being used.

New York amusement seekers and actors during the hot summer months will appreciate the liberality of the management of the Fifth avenue theater when they feel the cool breezes that will make the theater a delightful resort. The house has been thoroughly equipped with fan motors and it has been found possible to conceal the fans and render them noiseless. The Lundell outfit was chosen particularly on account of its noiselessness. The boxes will have each an individual outfit and there will be a plentiful distribution of fans throughout the auditorium, stage and dressing rooms. The Interior Conduit & Insulation company, whose wiring system is installed in the building, furnishes the Lundell fan outfit.

The General Electric company has reprinted in a neatly bound little book the article that appeared in the *Forum* of February, 1893, giving in detail the history of the company and its business at the present time. Not only does the article give a passing glance at well nigh every feature of interest pertaining to this giant industry, but it summarizes the work done by the company in connection with the World's Fair. Not the least interesting of the contents are the anecdotes of men whose names are best known to the electrical fraternity and the public at large. The style displayed in the reading matter is easy and interesting, and the illustrations are significant of each portion of the General Electric company's business.

BUSINESS.

A. O. Schoonmaker of New York is now offering to the trade East India mica in the solid sheet form, which he claims is superior to any of the manufactured articles now offered to the trade for all insulating purposes.

The Weston Electrical Instrument company of Newark, N. J., is very busy filling orders for the large call for its ammeters and voltmeters for central station and isolated plants, and has been taxed to its utmost in the immediate shipment of instruments in receipt of orders from exhibitors at the fair.

W. W. Marcus of Philadelphia continues to have many calls for his auxiliary mouthpiece for telephones, which is in use in many places. This mouthpiece rotates, and can thus be brought to the level of persons of any stature without the slightest loss of sound. Mr. Marcus will exhibit at the World's Fair in Y 12.

The Railway Equipment company, Chicago, reports numerous contracts made for its type G overhead material during the last few weeks. Railways companies in Tiffiin, O., Racine, Wis., Norristown, Pa., Mobile, Ala., Hazleton, Pa., Wheeling, W. Va., Wichita, Kan., and numerous other places throughout the country have made heavy orders.

Lucius T. Gibbs, formerly electrical engineer of the Milwaukee Street Railway company, has resigned his position to engage in the consulting engineering business and is located at 1103 Pabst building, Milwaukee. Mr. Gibbs bears flattering testimonials from the Milwaukee Street Railway company and Senator William F. Vilas as to his ability.

The Electric Appliance company, Chicago, is showing a very attractive line of Meston alternating current motors for special work at its World's Fair exhibit, space U 16. The Emerson company, manufacturer of the celebrated Meston motors and for whom the Electric Appliance company is the general western agent, has made some new applications of its motors this season and now has its alternating motor applied to a dental outfit and also as a sewing machine motor both being practical combinations. Another specialty of this season is its revolving motor which is a very ingenious piece of mechanism and a motor which promises to be very popular for ventilating purposes.

ELECTRICAL PATENTS.

Issued May 23, 1893.

497,771. Electric Heater. Samuel M. Cook, Boston, Mass.

497,790. Electric Broiler. Samuel B. Jenkins, Boston, Mass.

497,791. Electric Radiator. Samuel B. Jenkins, Boston, Mass.

497,792. Electric Flat-iron Heater. Samuel B. Jenkins, Boston, Mass.

497,793. Electric Soldering Iron. Samuel B. Jenkins, Boston, Mass.

497,794. Electric Heater for Flat-irons or Other Articles. Samuel B. Jenkins, Boston, Mass.

497,795. Electric Heater. Samuel B. Jenkins, Boston, Mass.

The electrical conductor is composed of metallic and non-metallic conductors, occupying alternate positions, with their ends held in contact by pressure, advantage being thereby taken of the heat produced in the passage of the current from a metallic to a non-metallic body.

497,800. Thermostat. Emil C. C. Krogh, Monmouth, Ill.

497,808. Railroad Rail and Process of Uniting Same. Arthur J. Moxham, Johnstown, Pa.

In order to effect a uniform weld throughout the entire cross-section of the pieces to be welded, the ends are so formed that the thinnest portions come in contact and are welded first, the remaining portions being brought in contact by upsetting the welding portion.

497,832. Electric Mining Machine. Elmer A. Sperry, Chicago, Ill.

497,836. Safety Block System for Railway Signaling. William R. Sykes, Jr., and John P. O'Donnell, London, Eng.

497,838. Safety Appliance for Systems of Electric Distribution. Elihu Thomson, Lynn, Mass.

The invention is designed to render normally low tension lines harmless when through accident they become crossed with a line of high tension. A connection to ground is established from the low tension line through an insulation, such that the normal low tension current is unable to pass, while a passage of a high tension current is permitted, thereby opening a low resistance path to ground, and shunting the high tension current to ground past the body of the person who may come in contact with the line. The insulation consists of a pair of electrodes normally separated from one another by a space containing an attenuated gas or vapor, the high tension current being adapted to traverse the space to close the low resistance circuit to ground.

497,844. Electrical Fuse-link. Marion C. Walls, Plymouth, Ind.

497,849. Wall Socket for Incandescent Lamps. Herbert C. Wirt, Boston, Mass.

497,852. Insulation for Underground Wires. Parvin Wright, Denver, Colo.

The conductor is centrally supported in a tube by means of longitudinally divided insulating pieces, the air being withdrawn from the tube and the same hermetically sealed.

497,869. Electric Accumulator. Paul J. R. Dujardin, Paris, France.

The accumulator plates are formed by decomposing a proportion of alkaline nitrate by an electric current in an acidulated bath, whereby an adhering layer of peroxide of lead is produced upon the plates.

497,887. Armature for Electric Motors or Generators. James F. McLaughlin, Philadelphia, Pa.

497,888. Electric Motor or Generator. James F. McLaughlin, Philadelphia, Pa.

497,898. Electrode Shield for Arc Lamps. Charles E. Scribner, Chicago, Ill.

The shield is designed to occupy a definite position with respect to the arc without reference to the movement of the carbon rod. The shield is mounted upon the upper end of the lower carbon by fingers in such a manner that the disintegration of the lower carbon will gradually remove the support from the shield, thus permitting it to descend by gravity as the lower carbon is burned away. In this manner the shield is maintained in a definite position with respect to the arc and the liability of the arc to burn up into the shield, to be obscured thereby, or to take a position at a considerable distance below the shield is avoided.

497,923. Thermostatic Instrument. Morris Martin, Malden, Mass.

497,942. District Telegraph Return Signal Key. John M. Bell, Tacoma, Wash.

497,955. Temporary Circuit Connector for Incandescent Electric Lamps. Gustav A. Frei, Springfield, Mass.

497,956. Incandescent Lamp. Gustav A. Frei, Springfield, Mass.

497,957. Incandescent Electric Lamp. Gustav A. Frei, Springfield, Mass.

A support is provided for the filament, and is secured to the base of the lamp between the leading-in wires, extending forward between the two limbs of the filament, where it bends at right angles, being provided upon its end with a loop adapted to encircle one limb of the filament to prevent the vibration of the filament.

498,022. Electric Current Time Meter. Henry H. Pattee, Monmouth, Ill.

498,141. Electrode for Arc Lamps. Albert C. Seibold, Mount Vernon, N. Y.

Each electrode is provided with two metallic coats with a filling of refractory material, as graphite, interposed between the two coats. The inner metallic coat directly surrounding the carbon is composed of copper, while the outer one is composed of nickel. The refractory material is designed to prevent the oxidation of the copper coat.

McLEAN & SCHMITT,

Room 416, - 197 S. Canal St., Chicago.

THE "CLARK" WIRE.

TRADE MARK.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

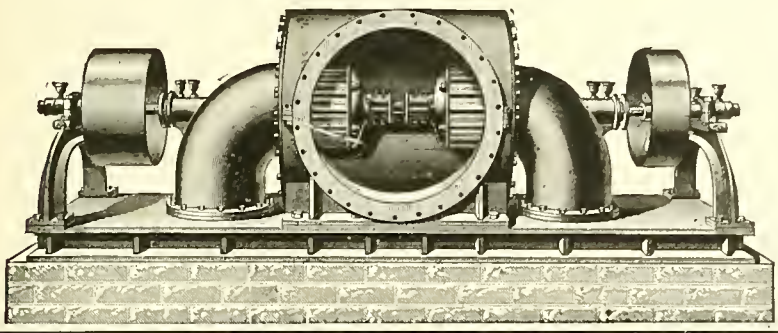
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

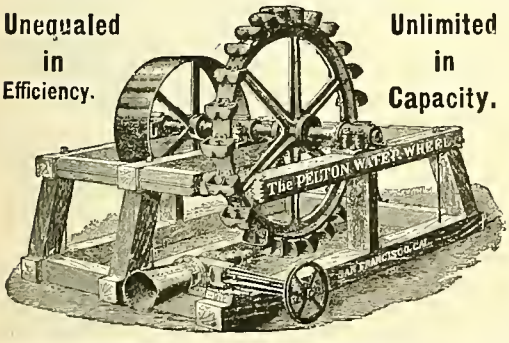
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 80 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

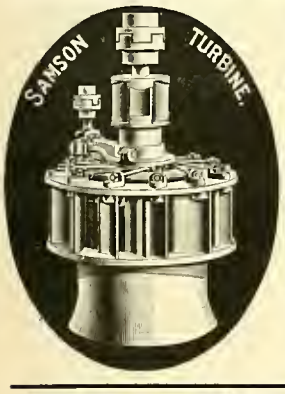
☞ It having come to our notice that our patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted.

PELTON WATER MOTORS. Varying from the fraction of 1 to 15 and 20 horse power, unequaled for all light running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ Send for Motor Circular. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates.



JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

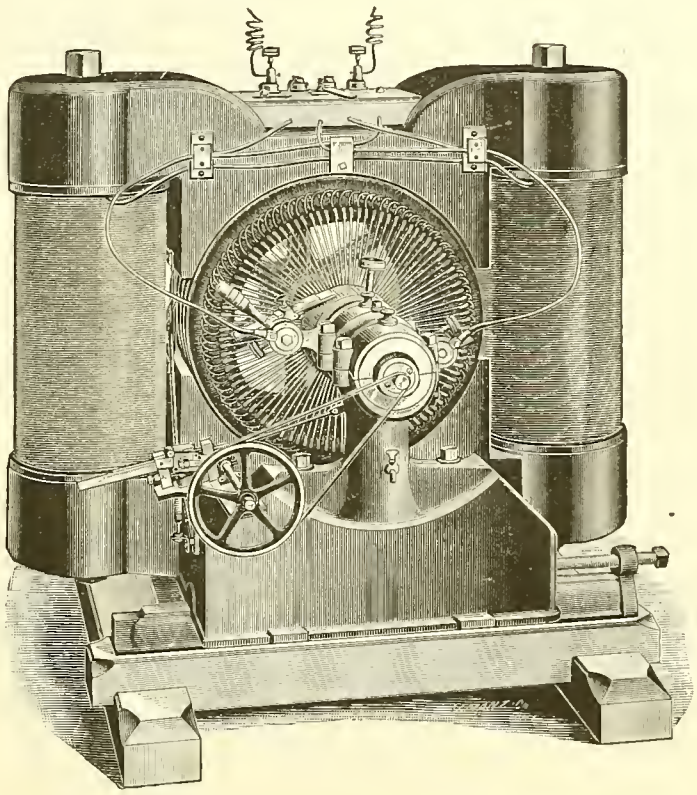
Works: 313-317 South Canal Street,

BUILDERS OF THE STANDARD SYSTEM OF ARC LIGHTING.

FOR FURTHER INFORMATION



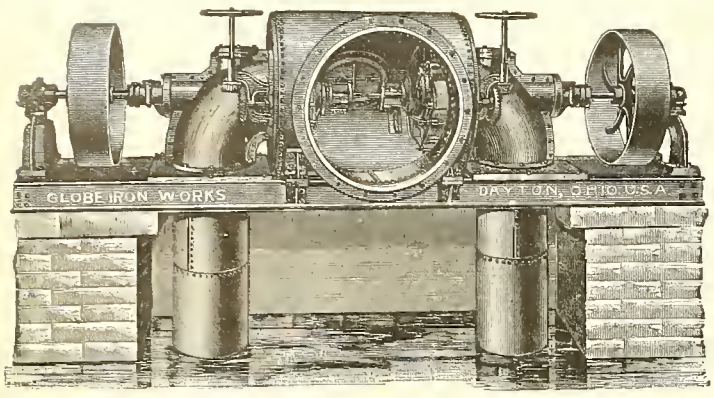
ADDRESS THE GENERAL OFFICES.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.



THE NEW AMERICAN
TURBINE WATER WHEEL.

PARTICULARLY ADAPTED TO DRIVING

Electric Light and Power Stations

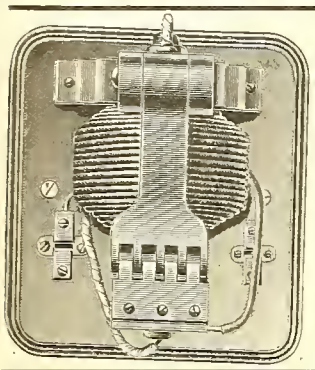
On account of its high efficiency at all stages of gate, steadiness of motion and easy working gate, the construction of which makes it the most sensitive to the action of a governor of any wheel on the market.

SEND FOR CATALOGUE Illustrating various styles of setting on both vertical and horizontal shaft.

THE DAYTON GLOBE IRON WORKS CO.,

SUCCESSORS TO
STOUT, MILLS & TEMPLE.

DAYTON, OHIO.

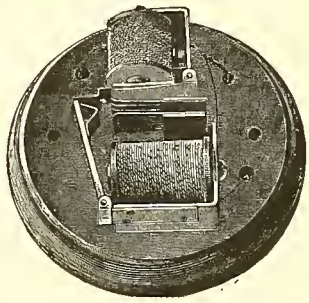


THE KESTER
Automatic Lightning Arrester

Will take care of any number of discharges of lightning per minute. They will prevent damage from lightning on any circuit not using the ground for return. They are intended only for station use and for the protection of generators and motors. They have no equal. They automatically rupture the arc formed by the lightning, and never short-circuit, thereby grounding the line. Price, $15.00 per set of two, and any one purchasing a set will be allowed to return them and have their money refunded provided they do not absolutely protect all circuits to which they are attached.

KESTER ELECTRIC CO.,
DYNAMOS, MOTORS AND POWER GENERATORS,
TERRE HAUTE, IND.

THE SECHRIST AUTOMATIC SWITCH



For controlling Incandescent Lights in private residences by using automatic gas keys and an ordinary battery or shunt circuit.

WANTED:—One good construction firm in each city to represent us.

Apply to
ALBERT SECHRIST,
Manufacturer and Patentee, DENVER, COLO.

WE DESIRE TO ANNOUNCE that we have added to our business a department of

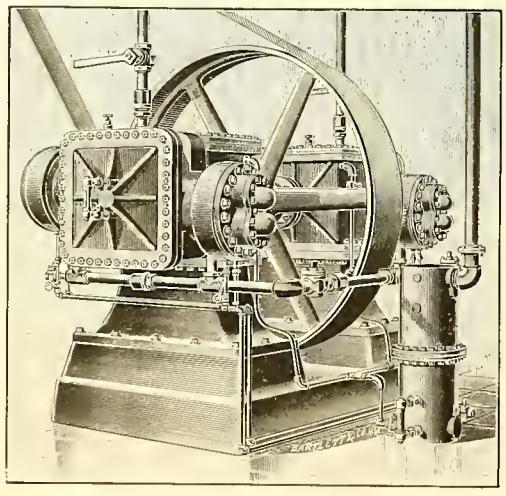
Ice Making and Refrigeration

in which field we recognize a demand for as high-class Engineering as we have been accustomed to give to the construction of Steam Power Plants. This department is distinct in its organization, with headquarters at our Boston Office, 620 Atlantic Avenue, under the immediate management of Mr. Church, with Frederick E. Murphy in executive authority as Engineer in charge.

After an investigation covering a period of two years, and conducted in the interests of our own proposed investment we have acquired control, by Exclusive License, of the Compressor and Condenser patented by Messrs. Hodges and Havenstrite, of Boston. Staking our reputation as judges of successful machinery, we offer them as the most mechanical, adaptable and economical apparatus for the purpose, thus far placed on the market.

The proportioning and construction of the distribution system, on which the successful working of both Ice-making and Refrigerating plants so largely depends, will be carried out consistently with the reputation for good engineering and good work which we enjoy.

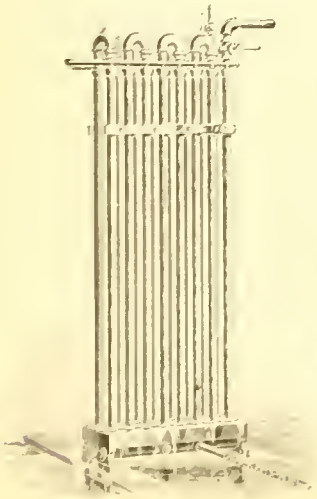
We are now prepared to contract for Plants for the manufacture of



ARTIFICIAL ICE

having any capacity from one-half ton to one hundred tons per day and upward. Artificial Ice has come to stay, equally for sanitary and economic reasons, and its manufacture is a stable and profitable enterprise, competing successfully against the natural product.

ARTIFICIAL REFRIGERATION



will receive our especial attention. In cold Storage Warehouses, Breweries, Packing Houses, and similar large Industries, it is already an established necessity. Into this class of plants we bring for the first time the manifest advantages of small space and headroom, and the subdivision of units, which last is the only means whereby a Refrigerating Plant can meet the fluctuation of the seasons with anything like uniform efficiency.

Refrigeration or combined Refrigeration and Ice-making, in small plants from one-half ton to ten tons per day, is now cheap and practicable, and this particular trade will be fully developed by us in its application to Markets, Creameries, Hotels, Apartment Houses, Hospitals, and Manufacturing processes of all kinds. In this latter field, we believe ourselves without successful competition.

Correspondence regarding any application of Artificial Cold will be to the mutual advantage of our customers and ourselves.

Very respectfully,

WESTINGHOUSE, CHURCH, KERR & CO.,

ENGINEERS,

620 Atlantic Avenue, Boston. Commercial Building, St. Louis.
17 Cortlandt Street, New York. Westinghouse Building, Pittsburg.
156 and 158 Lake Street, Chicago. Drexel Building, Philadelphia.

"NOVAK"

(TRADE MARK.)

We take pleasure in informing the public that after many months of experimenting we have succeeded in producing an Incandescent Electric Lamp superior to any of the numerous lamps hitherto offered to the public. The importance of the discovery may be realized when we inform you that the lamp now manufactured by us is a total departure in principle from all other incandescent lamps. Our lamp will maintain its

INITIAL CANDLE POWER at its INITIAL EFFICIENCY

throughout the usual average life of incandescent lamps.

The importance of this improvement can only be realized by those who have had the usual experience with lamps which begin to *decrease in candle power* and at the same time *increase their consumption of energy* as soon as put into service.

The "Novak" Lamp maintains its full candle power at the same efficiency throughout its life.

The "Novak" Lamp is fully protected by patents of our own, and is free from any possible claims of infringement of other patents.

The efficiency and average life of the "Novak" Lamp are fully equal to those of any other lamp ever offered.

The filament used in the "Novak" Lamp is the celebrated

"PERKINS" FILAMENT,

the superior quality of which is too well known to need comment by us.

We respectfully solicit correspondence in regard to the "Novak" Lamp, feeling sure that a lamp possessing the superior qualities of this lamp, and manufactured by a company whose business it is to supply the general public WITHOUT DISCRIMINATION, will be appreciated.

ILLUMINATED DIAL STATION VOLTMETER. Style B. (1-2 Size.)

These instruments are especially valuable for Central Station switchboards, having a scale 14 inches long which is illuminated by a lamp and a system of mirrors, thus making the indications plainly visible at a long distance. The accuracy of these instruments is fully equal to that of our portable voltmeters. Their dead-beat quality makes them unrivaled for **Power** and **Railway** circuits.

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, thoroughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

Westinghouse Electric & Mfg. Co.,

Pittsburgh, Pa.

MANUFACTURERS OF APPARATUS FOR

Arc Lighting, Incandescent Lighting,

LONG DISTANCE TRANSMISSION OF POWER,

Street Railway Generators, Motors, Appliances and Incandescent Lamps.

Our Alternating Current Incandescent Apparatus is in use in 508 Central Stations. Our Direct Current Apparatus in 2,500 Isolated Plants.

We are now transmitting Light and Power various distances up to 28 miles from the source. Our Multipolar Railway Generator and Single Reduction Motors have worked a revolution in the Electric Railway field.

The Sawyer-Man Stopper Lamp, made by us, has now been on the market since last January, and during that time it has proved itself the best and cheapest Incandescent Lamp offered to the public.

Vol. XII. CHICAGO, JUNE 10, 1893. No. 23

Electricity at the World's Fair.

Of course the event of last week in electrical circles at the World's Fair was the formal opening of the electricity building on Thursday night, and it is gratifying to be able to announce that the affair proved to be a conspicuous success. The drawing power of the electrical display was shown by the throng attracted by the announcement that all the spectacular effects in the building would be on view. There were about 70,000 people admitted to the gates during the day and evening, despite the rainy weather, and it was believed that from one-third to one half of these were drawn out solely by the announcement that the strange sights prepared for the public in the electricity building could be seen. At any rate every aisle of the great building was well filled with surging humanity during the evening, and many thousands witnessed the display, although the electric illumination about the grounds was unusually elaborate.

Although several exhibits are still incomplete, the general display, taken as a whole, was in a finished state, and the building presented by far the finest appearance that it has yet made. Early in the afternoon the aisles and exhibit spaces were cleared up, in pursuance of orders from Chief Barrett, and decorations in the shape of flags and potted plants were added. At eight o'clock, which was the hour fixed for the beginning of the illumination, the interior of the building presented a brilliant appearance. There was light, light everywhere, from hundreds of arc lamps and thousands of incandescents. Sousa's band was stationed in the east transept of the gallery and furnished excellent music during the evening, which greatly added to the enjoyment of the visitors, as they slowly passed about the building admiring the brilliant spectacle.

Of course the central attraction was the Edison light tower, which was exclusively illustrated in the WESTERN ELECTRICIAN last week. This was unveiled about eight o'clock, and when the graceful outlines of the column stood revealed there was a general "oh!" of surprise and admiration. The lighting was begun almost immediately, and lines of red, yellow and purple light were soon succeeding one another on the glistening white surface of the column, while all the time and over all the great prismatic bulb glowed with the light of many miniature lamps contained within it. Below, in the colonnade, was a flood of white light from a large number of artistic glass fixtures, and, taken altogether, the effect was very fine. When all the vari-colored lamps on the column and on the roof of the colonnade were burning together the effect was most beautiful, and the only criticism that can be advanced is that the volume of light in the lofty prismatic bulb was insufficient to fully bring out the beautiful effects possible with the myriad facets of this carefully built structure of glass. Doubtless this defect will be remedied. The switches in the base of the column were manipulated by E. W. Hammer, and he adapted the lines and waves of light to the surging rhythm of the music. During the periods when the lights on the shaft were extinguished the tower was illuminated by small search-lights placed on either side of the building.

But although the Edison tower was the principal attraction it was far from being the only one. The golden Westinghouse pavilion was lavishly lighted with incandescent lamps, and just north of it the great light house reflectors of the French revolved slowly and impressively. To the south the large Bell telephone pavilion was beautifully lighted, while the spectacular Western Electric display drew a great throng, with its gorgeous Egyptian temple, the popular column of light and "lightning," the "writing finger" and other novelties. In the gallery the principal spectacular displays were those of the H. W. Johns Manufacturing company, the New York & Ohio company and the K. A. P. Electrical Novelty company.

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—COLUMN OF LIGHT AND "LIGHTNING," ELECTRICITY BUILDING.

Chief Barrett, Mr. Hornsby and the officers of the department of electricity worked diligently to make the opening the success it proved and were naturally elated at the gratifying result. After the throng had dispersed an informal luncheon was given in the office of the department by Chief Barrett, which was attended by a few of his most intimate friends. The chief was the recipient of many congratulations. But one accident happened to mar the pleasure of the occasion, and that was a small fire in the pavilion of the Weston Electrical Instrument company about 9 o'clock. The blaze was started during the temporary absence of Mr. Heinrich, and its origin is not known. The flames mounted up one side of the structure in lively fashion, and for a few moments the fire threatened to become serious, but a volunteer fire department was instantly organized, and with the assistance of a stream from a stand-pipe and line of hose the flames were speedily extinguished, largely through the efforts of Superintendent Blaisdell, A. P. Eckert and Mr. Paiste. Considerable damage was done, however, especially by water, which, coming in unexpected volume and strength, not only put out the fire, but also destroyed the self-poise and disarranged the raiment of many of the spectators. Altogether, the night was an eventful one, and it will long be remembered.

In Fig. 1 is illustrated what visitors find one of the most pleasing sights in the electricity building — the Western Electric company's column of light, with the "lightning" streamers radiating from the top. The column is studded with over two thousand red, white and blue incandescent lamps, and as the broad band of light rises from the base and darts along the zigzag streamers the effect is very striking. Revolving balls of fire are suspended from the ends of the streamers, but are not shown in the illustration. An automatic revolving switch cuts the lamps in and out of circuit. This device can be seen by looking into the boxed-up pit shown at the right of the column, and it is usually surrounded by a throng of spectators. A corner of the Western Electric company's Egyptian temple is shown at the left, and the close observer will notice upon it delineations of ancient Egyptians engaged in such extremely modern occupations as trimming arc lamps and climbing telephone poles. A full description of this very attractive exhibit was given in the WESTERN ELECTRICIAN of May 20th.

Directly west of the Western Electric exhibit is the large pavilion of the American Bell Telephone company, illustrated in Fig. 2. This structure, which is severely Greek in architecture, is the largest pavilion in the building, and has been criticized as being out of proportion to its surroundings and as obstructing the view from the

south. The design of the building itself, however, possesses great intrinsic merit, and is generally commended. It was made by the architects of the agricultural building, which, from an architectural point of view, has disarmed all critics. The Bell pavilion contains a complete exposition of the telephone, from the crude instrument shown in the early patents to the long-distance system of to-day. It is also the headquarters of the World's Fair exchange, and the girls make the connections in full view of the spectators. Interesting statistics of the growth of the business, as well as models and drawings, are shown, and the central portion of the building is devoted to a telephonic concert room.

An illustration of the showy little display made by the K. A. P. Electric Novelty company of LaCrosse, Wis., and mentioned before is presented in Fig. 3. This company has a patent socket especially designed for rapid wiring in case of temporary illumination for celebrations and the like. It is claimed for it that by its use a wireman can wire ten times as many lights in a day as he can with ordinary sockets, and also, from the flexibility and construction of the socket, that it is particularly adapted for use in revolving designs and sign work. The use of the socket is illustrated in the exhibit, where a number of colored lamps are wired on a revolving belt, the effect being novel and striking when the belt is in motion. Contact is made with two copper strips on one of the pulleys on which the belt revolves, current being taken from an ordinary incandescent circuit. The pulley is made to revolve by power from a $\frac{1}{8}$ horse power Thomson-Houston motor. Another feature is a revolving globe, with the outlines of the various countries indicated by miniature incandescent lamps. The company also exhibits an electric cautery and rheostat for surgeon's use and designed for incandescent circuits. The cut, Fig. 4, shows the construction of the device and further explanation is hardly necessary. The apparatus can also be used for burning small surgical lamps of low voltage, such as are used for examining the throat and other cavities of the body. The display is located near the center of the eastern gallery.

The exhibit of the E. S. Greeley & Co., in the northeastern corner of the building, on the ground floor, which has heretofore been briefly described in this paper, continues to attract a large number of visitors, who take especial delight in lingering over the gold and ivory telegraph key which was pressed by President Cleveland to set the Allis engine and electric fountains in motion on the opening

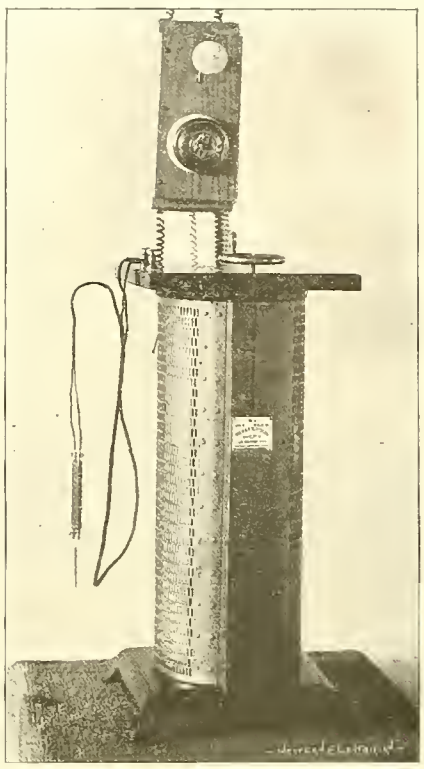

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—SURGEON'S ELECTRIC CAUTERY, ELECTRICITY BUILDING.

day. A view of the principal portion of the exhibit is given in Fig. 5. Louis J. Auernacher is in charge.

The rooms of the American Institute of Electrical Engineers, which are on the gallery floor of the electricity building, facing the southern hemicycle, have been tastefully fitted up with rugs, curtains, portieres, chairs and tables and will soon be open for the reception of visitors. The committee having in charge the arrangements for the rooms has not been idle, and W. J. Hammer, the chairman, makes the gratifying announcement that a number of interesting historical exhibits will be shown. Among these will be the apparatus by which Prof. Ferraris of Turin, Italy, made the first demonstration of a rotary field by means of alternating currents differing in phase. A piece of the circuit over which the first electric telephonic message was transmitted will be shown and also interesting historical relics of Franklin and Morse. Of contemporary electricians Elihu Thomson, Houston, Berliner, Edison, Van Der Weyde, Gray, Tesla, Sprague, Wallace and others will contribute. There will also be a fine collection of portraits of American and European electrical investigators. Altogether, the rooms will possess great intrinsic interest, aside from their convenience as a meeting ground for the members of the electrical fraternity.

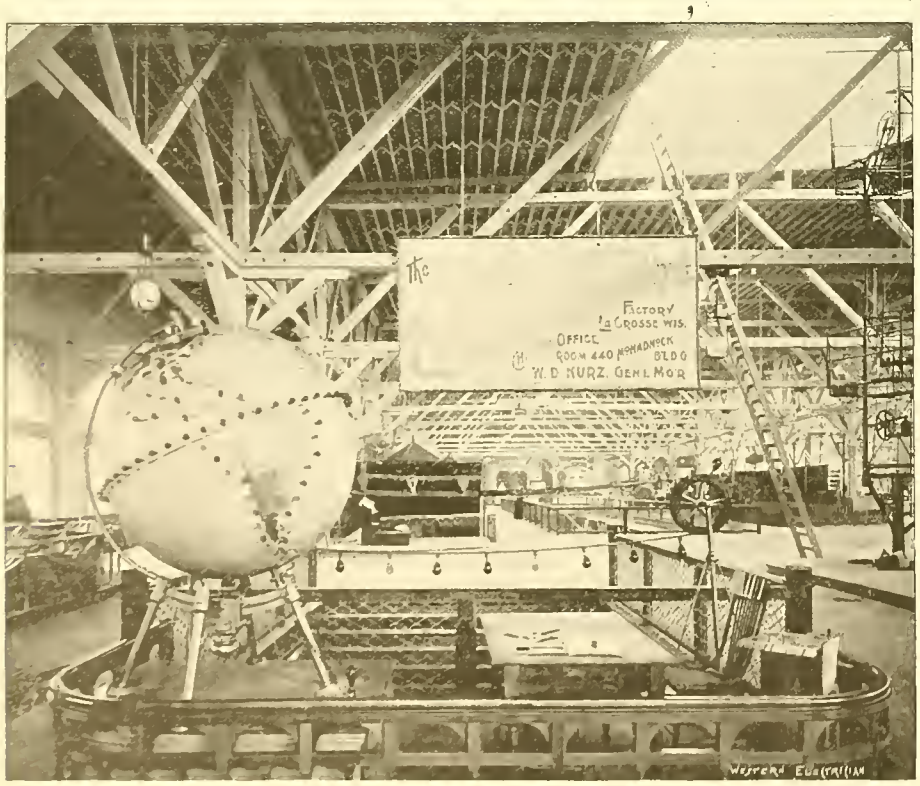

FIG. 5. ELECTRICITY AT THE WORLD'S FAIR.—NOVEL WIRING EXHIBIT, ELECTRICITY BUILDING.

The wiring for the service lighting at the World's Fair is now very nearly completed. Of fixed incandescent lights, exclusive of lamps furnished on special orders for exhibitors, 52,387 have now been wired, while 4,500 arc lamps are now ready for service, including about all those located in or north of the machinery and agricultural buildings.

The illumination of last Saturday evening was rendered notable by the fact that the big Schuckert search-light on the northwestern corner of the manufactures building was operated for the first time. Although no tests were made to demonstrate the strength of the light, the great beam attracted much attention from the visitors present.

One of the very first exhibits in electricity building to be completed was that of the Belknap Motor company of Portland, Me., which is illustrated in Fig. 6. The company has a complete display of its dynamos and moters, power being furnished by a 10 horse power motor operating on a 220 volt circuit, which drives a 100 light dynamo that furnishes current for arc and incandescent lamps, exhaust fans, a revolving sign and coffee mill motors. One interesting novelty is an electrically operated drill for use in iron work. The device is provided with a powerful electromagnet by which it can be instantly attached to a boiler or other iron surface and strongly held in position for the work to be done without other fastening. The magnetism holds the drill so firmly that a strong man cannot pull it away from the iron, although, when necessary, the machine can be easily removed by a twisting motion instead of a direct pull. The Belknap company's exhibit, which is located on the ground floor of the building, in the north eastern portion, is in charge of George W. Brown.

The lamp collection from the Edison lamp works is one of the most valuable and instructive in the building, while at the same time possessing great interest to the average sight seer. It can be found in the General Electric company's space, just north of the tower of light. Here are to be seen incandescent lamps of all sizes, shapes and colors, comprising in all nearly 2,500 specimens, many of them very rare and curious. No two lamps are shown in duplicate. The collection is arranged in cases, three of which are devoted to the fibrous growths experimented with by Edison when he was in search of the best material for the incandescent lamp filament. These products represent trips all over the world and an expenditure said to have reached $200,000 before the great inventor found what he was seeking in a Japanese bamboo, now cultivated on special plantations. The steps in glass working necessary for the production of the lamps are shown in several cases, while one is devoted to the Edison patents and another to the tools used in making the first "tar-putty" lamp. Of the "regular" types of lamps the ordinary standard lamp of all voltages and candle powers, municipal, railway and marine lamps are shown, while a bewildering array of "special" forms is exhibited, from those of a fraction of a candle power, giving just a pin-point of light, to a big multiple carbon lamp of 250 candle power. Some of the "special" forms are very odd, such as the door-knob type and the lamp with zigzag filament. The miniature lamps, also, assume grotesque forms and adopt all the hues of Joseph's coat. Special lamps are also shown which are used for purposes of resistance by the Western Union Telegraph company, and the display of experimental and historical lamps is very large and highly interesting. Those who are interested in electric lighting will find no more instructive display at the fair than this comprehensive and valuable exhibit.

One who has an appreciation for humor need not go outside the electrical features of the exposition to find mirth-provoking inscriptions. Thus one handsome pavilion in the gallery of electricity building bears this warning:

Do not throw packing cases against this pavilion.

The writer evidently held, and not without some show of reason, that a man who would throw packing cases at a pavilion was no gentleman. Another exhibitor whose display was almost entirely hidden by some ugly scaffolding put up by sign painters covered up his exhibit and then posted this sarcastic notice:

TO THE PUBLIC.

We will re-open our booth just as soon as these artistic decorations are removed. H. T. PAISTE.

But it was reserved for a German exhibitor in the manufactures building to tell his woes in English verse. One dark room in the section devoted to the Fatherland is decorated with this legend:

This room will be bright at day and night
As soon as Mr. Pierce gives us electric light.

That certainly tells the story with precision and grace.

The technical press is well represented in the electricity building. Among the out-of-town newspaper men who have paid recent visits or are now in attendance at the exposition are E. R. Dolby of *The Engineer*, London; W. J. Johnston and Nelson W. Perry of the *Electrical World*

New York; Charles W. Price of the *Electrical Review*, New York, and George B. Muldaur of the *Electrical Engineer*, New York.

Electric Heating.[1]

By S. B. Jenkins.

The extensive use of heat, in the economy and comfort of daily life, is seldom observed; and the expense of and labor incidental to the varied applications still less frequently estimated. The importance of heat is readily perceived upon reflection, but the exact estimation of its cost is a matter of considerable difficulty in common practice. There are three distinct and available agents for the generation of heat for domestic and industrial purposes, viz.: coal, gas and electricity. It has been stated by Tyndall that he was able to obtain from the combustion of coal in the best range a useful effect of 6 per cent., and that the average of domestic practice was 3 per cent. The combustion of gas gives a considerable higher efficiency, but its use is not at all commensurate with coal. In the generation of heat from electricity, an efficiency in the production of useful effect is realized, vastly greater than either, and with which they can never possibly compete. The perfection of conversion, the unvarying quality, the ease of precise estimation, and the ability to absolutely localize and control the exhibition of the heat of electricity are unique and decisive points of superiority.

Ethically the rheostat is an electric heater, and has been the inspiration of many inventions in electric heating, but the invention of numerous electric heaters, as such, has resulted in their being set apart as a distinct type of electrical apparatus.

While the fundamental principle of this conversion was understood, the early apparatus for the conversion, exhibition, and utilization of the heat, in the production of useful effect, was crude and inefficient; the idea seeming to prevail that it was only necessary to pass the current through a resistance, and the full effect must be realized, the intimately involved principles of radiation, conduction, and convection having apparently been omitted from consideration.

The first United States invention of record in this field was made by G. B. Simpson in 1859. The earliest authentic electric heating in this country, so far as can be ascertained, was that done by Prof. Moses G. Farmer, who asserts that he heated his house in the year 1867 with an electric heater on the lines of a rheostat.

Some less noteworthy and abortive attempts were made later by others, but it is only within five years that systematic attempts have been made to put electric heating on a commercial basis with any degree of success. This delay is the fault of neither the inventor, the capitalist nor the the electric heater, but is the result of conditions; for obviously, when produced from batteries, electrical energy was too expensive to be used in the very limited quantities called for by electric lighting, and entirely prohibitive as regards its use for heating; not, however, on account of any inefficiency in the conversion into heat, for the incandescence lamp of to-day has an efficienc, of 5 per cent., with a loss of 95 per cent., and in the electric heater these figures are practically reversed.

The introduction of the dynamo, with the consequent increase of the volume of current and decrease of cost, gave a powerful impetus, first to lighting, then, as station capacities increased, to the distribution of energy to motors, and finally, heating.

Owners and managers of generating plants perceive that if electric lighting and heating are on a similar basis, the output is from forty to sixty times as much for heating as for lighting, and that the load line, when the energy is furnished to lights, motors and heaters will be much more uniform. The heating of churches on Sunday would come when the lighting and motor load was very small. It remains to determine the commercial status of electric heating, which includes its operative advantages and cost.

The production of large volumes of electrical energy from water power has resulted in a demand for the electric heater in utilization thereof. A number of proposals have been received from established power plants to furnish energy at a definite price under definite conditions; such were the price and conditions that electric heating was much cheaper than any other method, and in every way beyond competition.

It requires some time to assimilate the idea of running two large generators for sixteen consecutive hours to heat one building simply, for the turning on of electric lights in that building would be merely an incident and would not appreciably increase the load; this, however, is precisely where we are to-day when water power in abundance is within ten or more miles.

In many of the small articles, such as smoothing irons and cooking utensils, any arrangement for varying the heat involves useless complications, or, on the direct circuits, the wasteful generation of heat in an external resistance.

It is sought to produce heat only when needed, and to apply it only and exactly where its useful effect will be greatest. This is the secret of the present success of electric heating.

Ovens, the service hot water boiler and some other continuously operated apparatus are constructed so that the temperature can be varied within wide limits, without the use of an exterior resistance.

In heating houses, offices and buildings generally, the heat may be made exactly proportional to the necessities, and admit of wide variation at pleasure.

One large city house that has been heated since the fall of last year has a large primary heater in the cold-air duct where the displaced hot-air furnace stood, and just below where the feeder pipes branch off to the risers; this heater is controlled by a switch close by.

Just within the register openings to the rooms above are located smaller "reheaters," each controlled by a switch in the appartment. In the early fall or late spring, when a gentle heat only is desired, the large primary heater is run; when more heat is necessary, the "reheaters" are turned on. Should heat be required in moderate weather, in only one appartment, it is instantly at hand without affecting other rooms.

Sectional radiators are constructed of the same general design as steam apparatus, together with stoves and portable heaters of every desirable size and style; and the first cost of this heating apparatus is in general terms not more, and often less, than ordinary apparatus doing similar work in a much inferior manner; for there is no odor, dust or gas, no coal pile, no ash sifting, no attendance of account, but there is absolute control and knowledge of exact cost.

A complete equipment for the kitchen, laundry and butler's pantry is provided, with which all the domestic operations may be conducted with perfect certainty and cleanliness, in less time and with half the labor incidental to old methods.

Beef is roasted at the rate of seven to seven and one-half minutes to the pound, and the quality of the work is only excelled by the ease of its performance. The heat, which is largely radiant and of great intensity, is produced evenly all around the oven, the effect being so perfectly uniform that it is not necessary to baste the meat or to turn the bread or cake while cooking.

Broiling is difficult under ordinary circumstances, as an intense clear fire is required, and care must be used to avoid smoking the meat, as that gives it a bitter flavor; the electric broiler meets all requisitions perfectly and easily, and steaks and chops are cooked in the usual time to the delight of connoisseurs.

Tea and coffee pots, of all styles, making the decoction from "the cold" in from six to ten minutes, of perfect quality, steam cookers, stew-pans, spiders, etc., are provided to meet all demands.

The domestic supply of hot water is furnished from the electrically heated copper service tank or a heater attached thereto.

The first cost of this equipment is about the same as that of the ordinary outfit.

As the laundry irons are not set on a stove they may be kept perfectly clean. The heat is an effective so-called "live heat," without the attendant discomfort in a hot day of a highly heated stove.

A variety of apparatus for industrial use is shown, such as soldering irons, devices for brazing and soldering, electrically heated muffles, and smoothing irons for tailors', dressmakers' and hatters' use. These are all simple, easily operated, and partake of the general advantages and have individual features of excellence. Electric tram-cars are heated equably and comfortably without difficulty.

All apparatus is constructed for operation on either direct or alternating circuits, having a potential of from 25 to 118 volts, with the exception of that for heating air, the car heater operating at 400 to 500 volts, and the heating apparatus for building at 104 to 236 volts.

Having noted the salient features of the apparatus, a detailed description of some practical tests will be of interest.

A hot water reservoir constructed of copper, tinned on the inside, nickeled on the outside, and having a capacity of 23 pounds of water at 60 Fahrenheit, without jacketing, and having an electrically heated bottom forming an integral part of the vessel, had placed in it 16 pounds of water from the service tap, at a temperature of 57 Fahrenheit. This was raised to 128 Fahrenheit in 20 minutes, or an effect was produced of 1136 lb deg. Fah., with an expenditure of electrical energy amounting to .326 horse power hour, which, at the contract price for power when and where this test was made, of 5 cents per horse power hour costs $ 0163, and the lb. deg. Fah. costs $ 00001434.

The cost of boiling one gallon from 40 Fahrenheit does not exceed 2 cents, by actual test, at this rate for energy. Some 500 heat units are expended in heating the vessel, and in radiation, so that the actual cost of the heat unit is in round numbers one one-thousandth of 1 cent.

In the oven 10 pounds of beef have been roasted, 2 loaves of bread baked and 12 plates heated for serving, all in 90 minutes, "from the cold," with an expenditure of energy amounting to 1.5 horse power hour, or 1119 watt hours; this at 5 cents per horse power hour is 7½ cents; or at 10 cents per horse power hour is 15 cents. At the 5 cent rate this oven costs about 2⅓ cents per hour, the first expense of "heating up" being gradually eliminated with each hour of continued service. Chops are cooked for 1 cent, an oyster stew made for ½ cent, tea and coffee for 4-10 of a cent, all in sufficient quantities for the ordinary table, the energy rate being 5 cents per horse power hour.

Large electric cars are heated to 60 Fahrenheit, under all weather conditions, with an average consumption of energy of 1,000 watts per hour, in the climate of Boston. This should be very satisfactory, though no exact figures of expense can be given, as the cost of power on electric railways is not stated It is fair to assume that it costs not more than 40 cents per car day of 18 hours. When electric cars are heated they undoubtedly divert to themselves sufficient carriage patronage to pay for the heating.

The average well-built city house in a block requires an equipment for heating, on the basis of an expenditure of electrical energy of 1 horse power per 1,200 cubic feet of space, though this amount is by no means required to be used continuously, and is stated as a maximum. It is impossible to give any exact figures unless for a particular instance when all the conditions are precisely stated. Steam heating engineers with long experience and voluminous data are accustomed to calculate the individu l

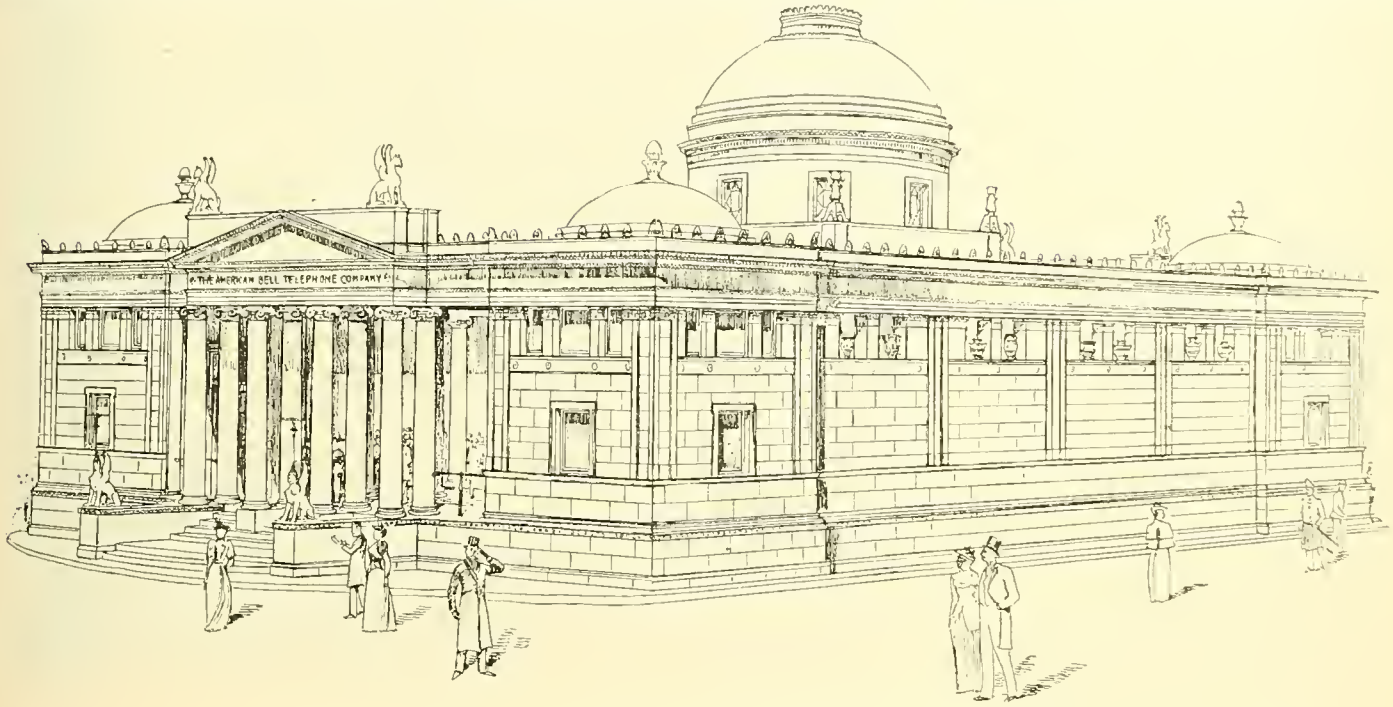

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR.—TELEPHONE PAVILION, ELECTRICITY BUILDING.

1. Read before the Chicago Electric club, May 15, 1893.

requirements, and only then will they guarantee results.

The ultimate large development of electric heating necessitates the production of vastly greater amounts of electrical energy than have heretofore been considered necessary; and it will be a growth, steady and sure, culminating, in less time than electric lighting has been before the public as a commercial entity, in a great industry, second only to the supplying of food.

It is now being adopted by many who are conversant with its advantages, who can at once replace the old contrivances with the new, and must very shortly be adopted by the many who, doing a part of the labor incidental to the household, seek to do it as easily, cleanly, and economically as possible, and by those who consider the welfare of dependants and that observance of economy which is both wise and honorable.

It was, in times past, faucet *vs.* pump; it is now switch *vs.* coalhod, and the triumph of the switch is unquestionably at hand, for the introduction of electric heating into houses, offices, hotels, hospitals, and theaters is being accomplished on a purely commercial basis.

Tyndall's estimates being accepted, that 6 per cent. or 780 heat units of the 13,000 in one pound of coal were utilized as a maximum, and assuming that 800 are now utilized, then 2,000 pounds of coal produces in useful effect 1,600,000 heat units.

One horse power hour of electricity produces 2,562 heat units, and upon this basis the following comparative table of the useful heat from coal and that from electricity has been calculated.

A horse power year is assumed to be 4,000 hours out of the 8,760 which the year contains.

EQUIVALENT USEFUL HEATING CAPACITY OF COAL AND ELECTRICITY.

ELECTRICITY.			COAL.
Per Watt-hour.	Per H. P. Hour.	Per H. P. Year.	Per 2000 lbs. delivered.

In round numbers, electricity at $.015 per horse power hour or $60.00 per horse power year of 4,000 hours (which is eleven hours per diem on an average) is equivalent in practical useful heating effect to coal at $6.00 per ton, and the coal must be hard coal of best quality, burned with good ordinary care and discretion. This is on the basis of a contract for power as follows, viz, consumer of power agrees to pay $60.00 per horse power per year, using it whenever he chooses—at the time if he desires—perhaps 8,760 hours; but the average use of the householder under average circumstances, would be 4,000 hours only—or eleven hours per diem throughout the year, except in sections of the United States, south of the Mason and Dixon line, where it would average about 3,000 hours only.

It should be observed that electrical energy can never be adulterated; that exactly the amount used is paid for, if attention at is given to the measurement. It is easily possible to measure electricity with greater precison than any other commodity, and to calculate the expense of any work done to the thousandth of a mill, if desired.

The preceding estimate is for the heating of houses only; the cooking is on a different basis entirely, as electricity at 5 cents per horse power hour will compete directly with coal at $5.50 per ton of 2,000 pounds.

Mr. Greene's Libel Suit.

The following statement by the *Boston Herald* will prove interesting in view of the proceedings instituted by the General Electric company against B. E. Greene, publisher of *Electricity*, to which reference was made last week:

Attention has been called to a fact, which until now has escaped notice, that there was a fatal omission of the word "fifth" in C. A. Coffin's reply to a series of categorical questions sent to him by a director of the General Electric company, as published in the evening edition of this paper on May 11th. Mr. Coffin was made to say:

"I can answer categorically to each one of the questions 'no,' except to the first part of your inquiry, and to that I answer 'yes.'"

Now, this should have read "except to the first part of your fifth inquiry," etc., and it did so read in the morning edition of May 12th, for which edition proof was read from the original copy, which was reprint.

This matter is revived now to correct any misapprehension which may have arisen from the compositor's blunder and because a technical paper in New York, or its owner, has been indicted for libel in part, at least, for republishing on May 17th the correspondence between Mr. Coffin and a fellow-director as it appeared in this paper on the evening of May 11th. The *Herald* regrets that a typographical error, for which human frailty was alone responsible, should have temporarily perverted fact and led to unpleasant consequences to any of its readers.

An electric street railway is to be constructed from Mansfield, R. I., to connect with Foxboro and Wrentham.

The Electric Heater.[1]

By T. Ahearn.

The increasing interest manifested in electric heating apparatus during the past year throughout the United States and Canada is highly satisfactory and, without a full knowledge of what interesting application of heating devices may have been made in the United States, I will endeavor in this paper to outline what we have accomplished in Canada and more particularly in the city of Ottawa.

The ideas relating to the limited field of electric heating are fast disappearing, and the notion that an electric light or railway plant, unless operated by water power, cannot profitably introduce electric heat is but an instance of history repeating itself, as witness the introduction of the telephone, incandescent light, etc.

When friction is overcome, heat is produced, whether the friction be the resistance of any portion of an electric circuit or of a purely mechanical character, as, for example, the application of the ordinary car brake, the resultant equivalent in each case appears as heat, so that if one or five horse power of electrical energy be absorbed in an electric heater the full amount is converted into heat.

A mechanical example of this conservation of force may be demonstrated by rubbing the right hand on the coat sleeve of one's left arm—if the rubbing is brisk and continued an unpleasant heating of the hand will result, the force expended in the muscular effort of rubbing results in an exact equivalent of heating of the hand, and the coat sleeve rubbed. This result is practically analagous to the heat developed in the wire of an electric heater. The resistance (or friction) offered, as in the rubbing of the coat sleeve, results in developing an exact equivalent of heat.

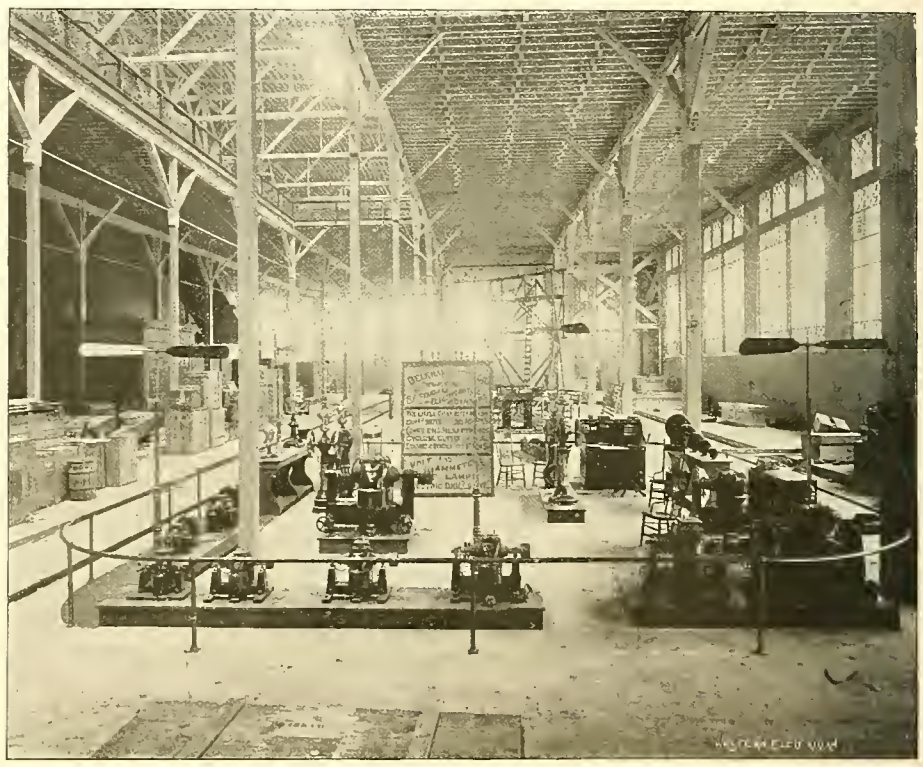

FIG. 6. ELECTRICITY AT THE WORLD'S FAIR.—BELKNAP MOTOR COMPANY'S EXHIBIT, ELECTRICITY BUILDING.

The operation of the electric heater may also be compared to that of an incandescent lamp in which, as is well known, good conductors of electricity are carried to the terminals of the lamp filament, which is purposely made a poor conductor, in order that the resistance offered by the filament and overcome by the current may produce a sufficiently high degree of heat to give the desired light. Although light alone is the object sought, it is but an accompaniment of the incandescence of the filament. In the electric heater, heat alone is desired, and heat alone is present.

The size and length of the lamp filament and the wire of the heater are both determined in very much the same manner, excepting that in the case of the heater, the calculation for the amount of wire does not subject the heating wire to such a degree of heat as in the case of the incandescent lamp. The size and length of wire employed in a serviceable electric heater should be such that the heat developed will not be sufficient to destroy it by oxidation or fusion. This is greatly assisted by the design and other conditions of manufacture, and in the case of my cylindrical 500 volt upright car stove the inlet of cooler air at the bottom and its rush through the heated cylinder result in a vigorous circulation of air through the space to be warmed, and this displacement of hot air by cooler air constantly relieves the heater wire within the stove.

Instead of making heaters on the plan of the rheostat, I have found that for marked results, and more particularly for the air draught, it is desirable to conserve the heat within the heater up to a certain degree, above which the construction of the heater should not permit the wire to reach.

I have also concluded that iron wire is most desirable, and among many of the points in its favor is that its resistance increases with the heat. The benefit of this quality is felt when the electromotive force is increased, as frequently happens for short intervals in nearly all classes of circuits.

By this method of construction and the use of good non-conductors of heat as insulation and packing, the heat developed in small water heaters and large water furnaces is directed to the copper water containing vessels around which the heating wire is wound; the heat is quickly transferred from the wire to the copper vessel which can never reach a very high degree of heat. The air draught in my other heater operates in very much the same manner as the presence of the water in the liquid heater.

It is an interesting fact that good conductors of heat are also good conductors of electricity, and the poor for one are also poor for the other. This conductive quality, which is common to both forms of force is very suggestive of a close relationship, which doubtless future investigation will determine. With the good conductors, such as copper, the current may be imagined as gliding freely through the atoms of the copper; while in the case of the comparatively poor conductor, iron, the atoms may be pictured to throw themselves, like barriers, across the track of the current, this friction, or as we term it, resistance, resulting in the development of heat. The mutual convertibility of the various natural forces is evinced from the combustion of coal in a power house, the dynamo converting the energy supplied by the coal into the convenient form of electricity, which is transmitted along wires to electric heaters placed at different points in the circuit, where we again have heat as at the starting point, the heater in turn giving up its heat to the surrounding air. It is evident thus that from electricity heat may be obtained; it is also true that from heat we can obtain electricity as in the ordinary thermo-electric pile—the application of heat to the junction of the dissimilar metals of the pile will be demonstrated by the movement of the needle of the galvanometer.

I will now proceed to a brief description of some of the electric heating installations which have been in successful operation during the past winter.

In July of last year I had erected in the car shop of our local electric railway a baker's oven eight feet square, which was built of brick in the usual way excepting that within the oven and set in the foundation were placed two of my 20 ampere, 50 volt cylindrical stoves, the interior of the oven being whitened and lighted with incandescent lamps, a small window looking into the oven and provided with three panes of plate glass separated from each other by air spaces being provided for the purpose of observing the process of baking and cooking. The oven was also equipped with a clock and pyrometer, which latter instrument recorded the degree of heat within the oven. The pyrometer indicating 400° Fahr., a neighboring baker tried a few pans of buns. The process of baking was watched with much interest, and from the puffing up of the dough to the pretty brown finish could be seen through the window of the oven, which, as before stated, is provided with incandescent lamps. A short time after, a full dinner of one of our leading hotels was cooked, including a 21 pound roast of beef, several turkeys, ducks and lamb. This electric dinner was served to the regular guests of the hotel, together with a distinguished company of invited guests. The cooking of the meats was pronounced perfect, and the time occupied in cooking was thirty minutes less than is usually required to do the same work in the hotel range.

It may be interesting to know that this oven has been in full blast since it was started, and the current has been applied constantly night and day without trouble of any

[1] Read before the Chicago Electric Club, May 22, 1893.

kind, and it is now used in drying out repaired electrical parts of railway equipment.

At the Central Canada Fair, held in Ottawa in September of last year, a baker's oven the same as described was erected in the main building, attended by a staff of bakers. The oven was provided on one side with a window, through which our delighted rurralists gazed in wonder. The oven proved the great card of the show, and the presence of a special policeman was required to keep the crowd moving. The baker started in selling a small bag of buns at five cents on the first day, but the law of demand justified him in increasing the price to twenty-five cents on the last day of the exhibition, when the supply was not sufficient, although fourteen pans were turned out every fourteen minutes. In the same building the Woman's Christian Temperance Union dining hall was made somewhat more attractive than in former years by the use of large electric water heaters, which supplied a dozen smaller heaters placed conveniently, and in which were made tea and coffee. The outfit was kept in continuous operation during the fair, and although hard pressed by the crowds present the supply was ample; no other means of heating water was employed. The success of this display will be best appreciated by the fact that the financial results were for the first time in many years of a satisfactory nature.

An ordinary hot water radiator connected by pipe with an electric furnace placed in a pit below the floor, lighted by incandescent lamps and covered with an iron grating flush with the floor, attracted the attention of householders. The absence of a chimney and other accessories of a hot water coal furnace, added to the fact that the closing

FIG 5. ELECTRICITY AT THE WORLD'S FAIR.—EXHIBIT OF THE E S GREELEY & CO., ELECTRICITY BUILDING.

of a switch only was necessary to obtain heat which might be continued indefinitely without dirt, dust or labor, was doubtless the main reasons for the innumerable inquiries made as to the cost of operation.

As no long continued test of this form of hot water house heating had ever been made, I concluded that only two installations of this description should be made during the winter just passed.

The first installation was made for the purpose of heating a gentleman's conservatory in Ottawa. The furnace was placed in the basement, the controlling switches on the floor above, and all connected with the 50 volt lighting circuit. The total amount of pipe employed in the conservatory was 300 feet, the current absorbed being equal to 3 horse power. The amount charged by the light company was based upon the cost of an equal amount of power from a motor circuit. The operation of this plant has been a great success, having worked continuously and absolutely without attention since October last, the user being so much pleased with its success that the question of heating the entire premises electrically is now under consideration.

The second installation of the hot water system was made in R. A. McCormick's drug store, Sparks street, Ottawa. The premises were piped throughout for hot water heating in November of last year, the electric furnace being placed in the basement. This 50 volt furnace was constructed in five independent heaters radially connected to a common supply pipe, each heater being independent of its neighbor, the five sections both mechanically and electrically being connected in multiple. Each of the sections was controlled by five 10 ampere switches which were placed in a row in the store above, so that for all conditions of the weather the heat could be regulated by turning off or on any of the five sections into which the furnace was divided. Another important consideration which suggested this design was that in the event of trouble with any one of the five sections comprising the complete furnace, it could be detached by closing the valves, and the particular section which might require examination could be removed without disturbing the other four-fifths. Despite the fact that the past winter was unusually severe in this usually cold climate, this outfit worked without a hitch and without attention of any kind, and provided at all times the heat desired.

For the usual Christmas display of the Chandiere Electric Light company, I designed an electric upright boiler, which operated a 1 horse power engine, both the engine and the boiler being placed upon a large table in the company's office. The boiler was provided with steam gauge, water glass, safety valve, etc. Being nickel plated throughout, it presented a very handsome appearance. The safety valve was set for 35 pounds pressure, which operated the engine. As heretofore steam engines have been employed in applying the power necessary to energize dynamos, the novelty of this outfit consisted in the fact that the electricity was developed by water power, which was converted into heat, making steam in the boiler, and which was then used in driving the steam engine.

The charge that is here made for current used in the numerous one gallon water heaters which have been largely introduced by the Chandiere Electric Light company is based upon the amount charged for the 16 candle power lamp, which is $8.00 per annum (the user paying for lamp renewals). Motor rates are charged for larger installations. These water heaters are used in barber shops, drug stores, bar rooms, etc., and absorb three times as much current as one 16 candle power lamp. The company collects fifty cents per week for the current supplied each heater, making $26 per annum as against $24 if the same current were used for lighting. The charge is considered small by the users and the service is very satisfactory.

The business done here during the past year in electric heating devices of various kinds has amounted to a very respectable sum and will here—as it should elsewhere—increase from year to year.

Last week an organization known as the Central Indiana Electric Railway company was perfected with a capital stock of $4,500,000. The purpose of the organization is to connect Indianapolis with Noblesville, Ind., and other towns with electric street car lines. The stockholders are Paul Pontus, Philadelphia; Illinois Electric Railway company, Chicago; J. T. Baker, Lewisburg, Pa.; N. D. Potious, Chicago; W. B. Keep, Chicago; G. A. P. Kiitz, Washington Heights; J. E. Crane, F M. S. Meten, C. H. W. Johnson, Chicago, and S. Harry Oliver, St. Louis.

It would appear that the city of Manchester, N. H., is suffering from the same species of municipal government in relation to its electric lighting that has disturbed other cities in the past few months. The city at present has a contract with an electric lighting company, which will not expire for eighteen months, but it was recently announced by the city government that a ten years' contract had been made with the Manchester Electric Light company for lighting the streets or the city. The publication of this notice created considerable astonishment and adverse criticism, as no bids had been received on the proposition. Soon after the contract was awarded the electric company of Manchester expressed its willingness to make a proposal to the city for doing the same lighting at a figure between $75 000 and $100,000 less than the contracted price to be paid the Manchester company. Now the taxpayers are demanding not only that the contract be revoked but that the city officials explain why such a contract was awarded eighteen months ahead of time and without receiving competitive bids.

Magnetic Curve Tracer.

At the recent conversazione of the Royal Society in London Prof. Ewing exhibited several magnetic curve tracers, one of which is illustrated in Figs. 1 and 2. This instrument shows the magnetic quality of iron, steel or other magnetic metal, by exhibiting the curve which connects the magnetization B with the magnetizing force H in any magnetizing process. The curve is exhibited upon a screen by

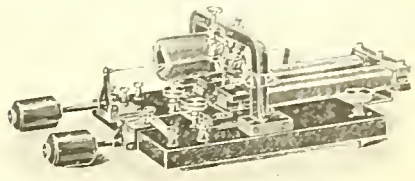

FIG. 1. MAGNETIC CURVE TRACER.

the spot of light reflected from a mirror, which receives two components of motion. The vertical component is proportional to the magnetization, and the horizontal component to the magnetizing force. Fig. 2 is a diagram showing the functions of the various parts. The mirror is pivoted upon a single needle point, which leaves it free to turn both ways, and it is connected by threads to the middle of two stretched wires, A A and B B, in such a manner that when either of the wires sags the mirror suffers a corresponding deflection. The threads are kept taut by light springs, the tension of which is adjustable. The wires are stretched in narrow slots, forming gaps in two magnetic circuits, D D and C. One of these circuits, D D, is made up of the iron or steel to be examined, along with suitable pole-pieces and yoke, and the current which passes through the magnetizing coils of this circuit passes also through the stretched wire, B B, in the gap of the other magnet. The other magnet is constantly magnetized by a steady current, and a steady current also flows through the stretched wire A A. Hence, when the magnetizing current of D D is altered, the wire B B sags out or in, and gives horizontal motion to the mirror proportional to the magnetizing force acting on D D. And when the magnetism of D D is altered, the wire A A sags up or down, giving vertical motions to the mirror proportional to the changes of magnetism.

The samples to be tested form the arms of D D. They may be solid rods, or rods built up of thin strips, or of wire. The rods supplied with the instrument are of soft sheet iron, built up of insulated strips, with a net cross section about 1 inch by ½ inch and about 18 inches long. In preparing other rods for comparison of magnetic quality, the same dimensions are to be chosen as those of the standard rods. Clamps are provided at the pole-pieces to allow the rods to be readily inserted and removed. The cuts are reproduced from the London *Engineer*.

At the same meeting several striking experiments were made by A. C. Swinton on the lines originated by Tesla. The filament of an ordinary 5 candle power 100 volt lamp was caused to incandesce with current conveyed through the human body; the filament then gave out a yellowish light. Sparks, evidencing a difference of potential of some thousands of volts, were produced between the two hands of the same operator. A luminous spiral was produced in an exhausted glass tube by molecular bombardment from a wire spiral wound outside the tube. Some effects produced by high frequency discharges passing through semi-conducting substances, and striking liquids were also exhibited.

Professor Marshall Ward, by the aid of the electric lan-

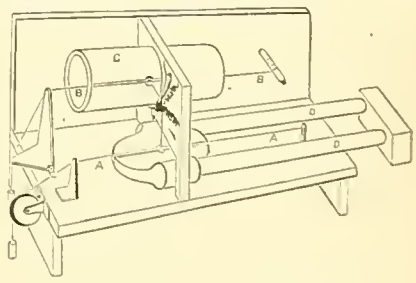

FIG. 2. MAGNETIC CURVE TRACER.

tern, exhibited on the screen some photomicrographs illustrating the action of solar and electric light on the spores of bacteria and fungi. The action of strong light is to kill them when the exposure is long enough, amounting in some cases to about two hours, and the blue rays are most powerful in producing the effect; the less refrangible waves of the spectrum have little influence in the matter.

The Waco, Tex., Electric Railway company will add two miles of track to its lines.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

REPORTS from Springfield, Ill., last week indicated that the Thiele lighting bill would not pass the lower house of the Legislature after all, in fact the outlook for having it reported by the committee on municipal corporations to which it had been referred was gradually diminishing. The bill was discussed in this committee last week and received little support. Speaker Crafts was appealed to for recognition to call the bill back to the House, but would give no promise. He said the bill should be amended to include incorporated towns, and by striking out the provision for the purchase of existing plants. A correspondent, commenting on this proposition says: "With that provision out, the bill would be of no possible use to Chicago, a fact that Mr. Crafts knows as well as he knows anything. The long and short of it seems to be that Mr. Crafts is as willing to see the bill killed as his committee is determined to kill it. McMurdy seems to be the only man on the committee who is fighting for the bill. Probably King and a few others would vote for it in the House but they don't seem to be wasting zeal on it in the committee. There is really no reason why the bill should receive favorable consideration, or, in fact, any consideration whatever. If the time of the members is of any value the bill should be summarily dismissed. The measure looks like a sand-bagging scheme, and no self-respecting member can be identified with it.

DESPITE the adverse criticism of experienced engineers projectors of street railway enterprises in which some other power than horses is required are looking to the storage battery for a solution of the problem. There is no doubt of the popularity of that system among the people, and progressive railway managers favor it on this account, but there are many who believe that the development of the battery can be accomplished much more satisfactorily in islolated lighting work. Prof. Forbes in his address at St. Louis said that this was the general impression in England, where considerable advancement had been made, and several American engineers expressed similar views. But storage battery men are not wanting who believe that with a fair trial accumulators can demonstrate their ability to compete with the overhead trolley system. It is gratifying to learn that such a test is about to be had in New York city shortly, and that an experimental station is now being equipped for that purpose. The work will be under the joint supervision of the battery company and the street railway corporation, and as the latter desires to utilize the battery, there is every reason to believe that it will be given a fair trial, and that the whole subject will be honestly investigated. It is to be hoped that figures will be presented showing the cost of operation, and that the experience thus gained will be placed at the disposal of the street railway mangers of the country. Heretofore it has been impossible to get reliable and explicit information showing fully the cost of installation and maintenance. Now, however, that the experiments are to be conducted by men favorable to the project, there should be no hesitation about keeping a complete record and giving it to the public.

TELEPHONIC journalism is a feature of life in Buda Pesth, and it is believed by the promoters of this novel scheme that it will prove popular with the people. It is proposed to establish a system covering the entire city, dividing it into eight districts, all of which are to be connected to the central office. At the telephone exchange a regular newspaper bureau is conducted, the news of the city being collected by a regular staff of reporters and foreign reports being received through the regular telegraphic service. All of this is condensed into the briefest possible statement for publication in the *Telephonic Gazette*. At 9 a. m. each day the "editor" assumes his post at the central station, and begins to tell the story of the day's news. After the first budget is sent out it is repeated in order that those who may have missed anything can be fully informed. At 10 o'clock the "second edition" is ready and at regular intervals throughout the day these oral editions of the *Telephonic Gazette* are issued. In the evening, lectures are reported, local entertainments are described for the benefit of the ladies, the latest attraction at the theaters are reviewed by the dramatic critic, and the young ladies are permitted to listen to a concert; "they can distinguish wonderfully well the touching pathos of the violoncello, the pearly staccatos of the violin, the sweet melodies of the flute, and the enchanting voice of the prima donna." The *Oriental Review* is authority for the statement that "by the aid of a single wire of the state telegraph line, our central station has been connected simultaneously with the telephone stations of Vienna, Gratz, Brunn, and Trieste; and in all those cities the voice of the *Gazette's* editor has been heard—clear, sonorous, and with every shade of intonation."

THE completion of the duplicate cable of the Central & South American Telegraph company last week marked an important achievement by American enterprise. The cable in question is 2 524 miles in length and was laid in ten months, a record heretofore unattained in cable operations. This company which, in conjunction with the Mexican Telegraph company and the Western Union Telegraph company, controls the cable business of the Spanish American countries, has a very comprehensive system. The cables begin at Galveston, Texas, running from that city to Tampico and Vera Cruz, in Mexico. This country is crossed at its narrowest point by land lines. From Salinas the cables reach Libertad in San Salvador and San Juan Del Sur in the lower part of Nicaragua. From the latter place one cable runs to Panama and touches lower down in the United States of Columbia; the other extends farther out into the Pacific; but the two lines meet on the coast of Ecuador. One line touches at Paytha in the upper part of Peru and both meet at Lima. The next point reached is Iquique, in Chile, and then the cables run down the coast to Valparaiso. Land lines extend directly across the continent from Valparaiso to Montevideo, and from that city the cable runs to Rio Janeiro. The companies have proved very profitable enterprises and have done much to attract capital to the countries in which they operate.

One result of the successful completion of the cable was to revive interest in the proposition to establish direct telegraphic communication between this country and Honolulu. The necessity of such a line was fully demonstrated at the time of the recent revolution in Hawaii. Even with only a remote possibility of annexation it is probable that a bill providing for an appropriation would now receive careful consideration by Congress. The Senate of the Fifty-first Congress passed a bill for that purpose but the House failed to concur. It did, however, authorize the making of a survey of the proposed route. This work has now been completed by the Thetis and the Albatross, and the results have been published by the Hydrographic Office. As a result it is shown that a cable can be laid to Hawaii having a length only a few hundred miles in excess of that of the original Atlantic wire from Valentia Bay to Heart's Content, and about equal to that of the line between Brazil and Africa. There are unquestionably high peaks and deep valleys in the Pacific, which make the route quite different from that of the Atlantic plateau, but the bottom is good, and it is favorable for preserving the cable. It is to be hoped that this much needed enterprise will be undertaken and carried to successful completion by American capital and American energy.

AFTER a month's delay the electricity building at the World's Fair now presents a practically finished appearance, although many beautifying touches here and there can still be added to advantage. The opening took place on June 1st, and although distinguished by no particular formality the affair proved eminently successful. One thing was proved beyond a doubt, and that is that the attractions of the electricity building form a center of great popular interest, and that the people like to see them at night. No better argument for opening the World's Fair on every evening could be advanced than the object lesson afforded by the way in which the people turned out to the evening illumination on Thursday night of last week. The wonders of electricity have a strange fascination for all, and the directors of the exposition can take no wiser or more popular step than to throw open the gates of the World's Fair at the time when this attractive feature can be seen at its best.

The various electrical features of the great exposition are now nearly all completed for public inspection, the two most conspicuous exceptions being the electric fountains and the 2,000 horse power directly connected engine and generator in the intramural power station. The extent and variety of the showing in this department is bewildering, and we can give no better advice to the visitor who is particularly interested in electrical matters than to get a general idea of the display from the World's Fair opening number of the WESTERN ELECTRICIAN, published May 6th, and then pick out such portions as he cares to examine in detail or lay out an itinerary for the whole.

It cannot be doubted that the electrical industry as a whole will be vastly beautified by the magnificent showing made at Jackson Park, where the well-nigh indispensable part played by electricity in modern American life is brought home to the visitor with great force at almost every turn. To mention one instance of the benefit that will accrue, it may be stated without fear of contradiction that the World's Fair will do more to popularize the electric launch among the well-to-do classes of the United States than ten years of ordinary commercial work. And so it will be, in greater or lesser degree, in all branches of electrical work. The World's Fair of 1893 will go down into history as the first international exhibition in which the commanding position of electricity, both in science and industry, was distinctively recognized. As such it should receive the loyal and hearty support of all members of the electrical fraternity.

But what of the future? What will be the next great step? Will it be the general application of electricity to existing long distance steam railways, the perfection of the storage battery for street railway service, the general adoption of electric heating, the production of incandescent light without conducting wires, or will it be possible to utilize the stored energy of coal in electricity without the costly interposition of boiler and steam engine? He would be a bold prophet who should attempt to foretell the limit, the *Ultima Thule*, of this line of progress. The subject is extremely interesting, but the perpetual query as to what the future has in store constitutes a question which Father Time alone can answer.

Light and Other High Frequency Phenomena.

By Nikola Tesla.

PART II.

These high frequency currents are obtained in a peculiar manner. The method employed was advanced by me about two years ago in an experimental lecture before the American Institute of Electrical Engineers. A number of ways, as practiced in the laboratory, of obtaining these currents either from continuous or low frequency alternating currents is diagramatically indicated in Fig. 1, which will be later described in detail. The general plan is to charge condensers from a direct or alternate current source, preferably of high tension, and to discharge them disruptively while observing well-known conditions necessary to maintain the oscillations of the current. In view of the general interest taken in high frequency currents and effects producible by them, it seems to me advisable to dwell at some length upon this method of conversion. In order to give you a clear idea of the action, I will suppose that a continuous current generator is employed, which is often very convenient. It is desirable that the generator should possess such high tension as to be able to break through a small air space. If this is not the case, then auxiliary means have to be resorted to, some of which will be indicated subsequently. When the condensers are charged to a certain potential, the air or insulating space gives way and a disruptive discharge occurs. There is then a sudden rush of current and generally a large portion of the accumulated electrical energy spends itself. The condensers are thereupon quickly charged and the same process is repeated in more or less rapid succession. To produce such sudden rushes of current it is necessary to observe certain conditions. If the rate at which the condensers are discharged is the same as that at which they are charged, then, clearly, in the assumed case the condensers do not come into play. If the rate of discharge be smaller than the rate of charging, then, again, the condensers cannot play an important part. But if, on the contrary, the rate of discharging is greater than that of charging, then a succession of rushes of current is obtained. It is evident that, if the rate at which the energy is being dissipated by the discharge is very much greater than the rate of supply to the condensers, the sudden rushes will be comparatively few, with long time intervals between. This always occurs when a condenser of considerable capacity is charged by means of a comparatively small machine. If the rates of supply and dissipation are not widely different, then the rushes of current will be in quicker succession, and this the more, the more nearly equal both the rates are, until natural limitations incident to each case and depending upon a number of causes are reached. Thus we are able to obtain from a continuous current generator as rapid a succession of discharges as we like. Of course, the higher the tension of the generator the smaller need be the capacity of the condensers, and for this reason, principally, it is of advantage to employ a generator of very high tension. Besides, such a generator permits the attaining of greater rates of vibration.

The rushes of current may be of the same direction under the conditions before assumed, but most generally there is an oscillation superimposed upon the fundamental vibration of the current. When the conditions are so determined that there is no oscillation, the current impulses are unidirectional, and thus a means is provided of transforming a continuous current of high tension into a direct current of lower tension, which I think may find employment in the arts.

This method of conversion is exceedingly interesting, and I was much impressed by its beauty when I first conceived it. It is ideal in certain respects. It involves the employment of no mechanical devices of any kind, and it allows of obtaining currents of any desired frequency from an ordinary circuit, direct or alternating. The frequency of the fundamental discharges depending on the relative rates of supply and dissipation can be readily varied within wide limits by simple adjustments of these quantities, and the frequency of the superimposed vibration by the determination of the capacity, self-induction and resistance of the circuit. The potential of the currents, again, may be raised as high as any insulation is capable of withstanding safely by combining capacity and self-induction or by induction in a secondary, which need have but comparatively few turns.

As the conditions are often such that the intermittance or oscillation does not readily establish itself, especially when a direct current source is employed, it is of advantage to associate an interrupter with the arc, and I have, sometime ago, indicated the use of an air blast or magnet, or other such device readily at hand. The magnet is employed with especial advantage in the conversion of direct currents, as it is then very effective. If the primary source is an alternate current generator, it is desirable, as I have stated on another occasion, that the frequency should be low, and and that the currents forming the arc be large, in order to render the magnet more effective.

A form of such discharger with a magnet which has been found convenient, and adopted after some trials, in the conversion of direct currents particularly, is illustrated in Fig. 2. *N S* are the pole pieces of a very strong magnet which is excited by a coil *c*. The pole pieces are slotted for adjustment and can be fastened in any position by screws s_1 s_1. The discharge rods d d_1, thinned down on the ends in order to allow a closer approach of the magnetic pole pieces, pass through the column of brass b b_1 and are fastened in position by screws s_2 s_2. Springs r r_1 and collars c c_1 are slipped on the rods, the latter serving to set the points of the rods at a certain suitable distance by means of screws s_3 s_3, and the former to draw the points apart. When it is desired to start the arc, one of the hard rubber handles h h_1 is tapped quickly with the hand, whereby the points of the rods are brought in contact but are instantly separated by the springs r r_1. Such an arrangement has been found to be often necessary, namely, in cases when the electromotive force was not large enough to cause the discharge to break through the gap, and also when it was desirable to avoid short circuiting of the generator by the metallic contact of the rods. The rapidity of the interruptions of the current with a magnet depends on the intensity of the magnetic field and on the potential difference at the ends of the arc. The interruptions are generally in such quick succession as to produce a musical sound. Years ago it was observed that when a powerful induction coil is discharged between the poles of a strong magnet the discharge produced a loud noise not unlike a small pistol shot. It was vaguely stated that the spark was intensified by the presence of the magnetic field. It is now clear that the discharge current, flowing for some time, was interrupted a great number of times by the magnet, thus producing the sound. The phenomenon is especially marked when the field circuit of a large magnet or dynamo is broken in a powerful magnetic field.

When the current through the gap is comparatively large, it is of advantage to slip on the points of the discharge rods pieces of very hard carbon and let the arc play between the carbon pieces. This preserves the rods and besides has the advantage of keeping the air space hotter, as the heat is not conducted away as quickly through the carbons, and the result is that a smaller electromotive force in the arc gap is required to maintain a succession of discharges.

Another form of discharger which may be employed with advantage in some cases is illustrated in Fig. 3. In this form the discharge rods d d_1 pass through perforations in a wooden box *B*, which is thickly coated with mica on the inside, as indicated by the heavy lines. The perforations are provided with mica tubes m m_1 of some thickness, which are preferably not in contact with the rods d d_1. The box has a cover *C*, which is a little larger and descends on the outside of the box. The spark gap is warmed by a small lamp *l* contained in a box. A plate *p* above the lamp allows the draught to pass only through the chimney *c* of the lamp, the air entering through holes *o o* in or near the bottom of the box and following the path indicated by the arrows. When the discharger is in operation the door of the box is closed so that the light of the arc is not visible outside. It is desirable to exclude the light as perfectly as possible, as it interferes with some experiments. This form of discharger is simple and very effective when properly manipulated. The air being warmed to a certain temperature has its insulating power impaired, it becomes dielectrically weak, as it were, and the consequence is that the arc can be established at much greater distance. The air should, of course, be sufficiently insulating to allow the discharge to pass through the gap disruptively. The arc formed under such conditions, when long, may be made extremely sensitive, and the weak draught through the lamp chimney *c* is quite sufficient to produce rapid interruptions. The adjustment is made by regulating the temperature and velocity of the draught. Instead of using a lamp it answers the purpose to provide for a draught of warm air in other ways. A very simple way which has been practiced is to inclose the arc in a long vertical tube with plates on the top and bottom for regulating the temperature and velocity of the air current. Some provision had to be made for deadening the sound.

The air may be rendered dielectrically weak, also, by rarefaction. Dischargers of this kind have likewise been used by me in connection with the magnet. A large tube is for this purpose provided with heavy electrodes of carbon or metal, between which the discharge is made to pass, the tube being placed in a powerful magnetic field. The exhaustion of the tube is carried to a point at which the discharge breaks through easily, but the pressure should be more than 75 millimeters, at which the ordinary thread discharge occurs. In another form of discharger, combining the features before mentioned, the discharge was made to pass between two adjustable magnetic pole pieces, the space between them being kept at an elevated temperature.

It should be remarked here that when such or interrupting devices of any kind are used and the currents are passed through the primary of a disruptive discharge coil, it is not, as a rule, of advantage to produce a number of interruptions of the current per second greater than the natural frequency of vibration of the dynamo supply circuit, which is ordinarily small. It should also be pointed out here that while the devices mentioned in connection with the disruptive discharges are advantageous under certain conditions, they may be sometimes a source of trouble, as they produce intermittences and other irregularities in the vibration which it would be very desirable to overcome.

There is, I regret to say, in this beautiful method of conversion a defect, which fortunately is not vital, and which I have been gradually overcoming. I will best call attention to this defect and indicate a fruitful line of work by comparing the electrical process with its mechanical analogue. The process may be illustrated in this manner. Imagine a tank with a wide opening at the bottom, which is kept closed by spring pressure, but so that it snaps off suddenly when the liquid in the tank has reached a certain height. Let the fluid be supplied to the tank by means of a pipe feeding at a certain rate. When the critical height of the liquid is reached, the spring gives way and the bottom of the tank drops out. Instantly the liquid falls through the wide opening, and the spring, reasserting itself, closes the bottom again. The tank is now filled, and after a certain time interval the same process is repeated. It is clear, that if the pipe feeds the fluid quicker than the bottom outlet is capable of letting it pass through, the bottom will remain off and the tank will still overflow. If the rates of supply are exactly equal, then the bottom lid will remain partially open and no vibration of the same and of the liquid column will generally occur, though it might, if started by some means. But if the inlet pipe does not feed the fluid fast enough for the outlet, then there will be always vibration. Again, in such case, each time the bottom flaps up or down, the spring and the liquid column, if the pliability of the spring and the inertia of the moving parts are properly chosen, will perform independent vibrations. In this analogue the fluid may be likened to electricity or electrical energy, the tank to the condenser, the spring to the dielectric and the pipe to the conductor through which electricity is supplied to the condenser. To make this analogy quite complete it is necessary to make the assumption that the bottom, each time it gives way, is knocked violently against a non-elastic stop, this impact involving some loss of energy, and that, besides, some dissipation of energy results, due to frictional losses. In the preceding analogue the liquid is supposed to be under a steady pressure. If the pressure of the fluid be assumed to vary rhythmically, this may be taken as corresponding to the case of an alternating current. The process is then not quite as simple to consider, but the action is the same in principle.

It is desirable, in order to maintain the vibration economically, to reduce the impact and frictional losses as much as possible. As regards the latter, which in the electrical analogue correspond to the losses, due to the resistance of the circuits, it is impossible to obviate them entirely, but they can be reduced to minimum by a proper selection of the dimensions of the circuits and by the employment of thin conductors in the form of strands. But the loss of energy caused by the first breaking through of the dielectric—which in the above example corresponds to the violent knock of the bottom against the inelastic stop—would be more important to overcome. At the moment of the breaking through the air space has a very high resistance, which is probably reduced to a very small value when the current has reached some strength, and the space is brought to a high temperature. It would materially diminish the loss of energy if the space were always kept at an extremely high temperature, but then there would be no disruptive break. By warming the space moderately by means of a lamp or otherwise, the economy as far as the arc is concerned is sensibly increased. But the magnet or other interrupting

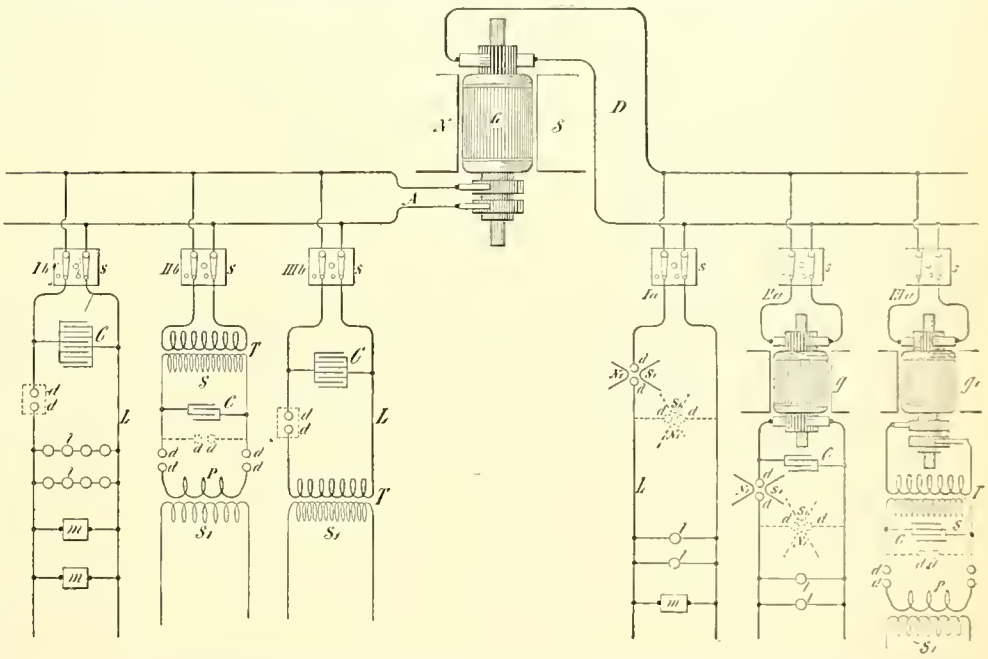

FIG 1. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—PLAN OF CONNECTIONS USED IN THE CONVERSION BY MEANS OF THE DISRUPTIVE ARC DISCHARGE.

device does not diminsh the loss in the arc. Likewise, a jet of air only facilitates the carrying off of the energy. Air, or a gas in general, behaves curiously in this respect. When two bodies, charged to a very high potential, discharge disruptively through an air space, any amount of energy may be carried off by the air. This energy is evidently dissipated by bodily carriers, in compact and collisional losses of the molecules. The exchange of the molecules in the space occurs with inconceivable rapidity. A powerful discharge taking place between two electrodes, they may remain entirely cool, and yet the loss in the air may represent any amount of energy. It is perfectly practicable, with very great potential differences in the gap, to dissipate several horse power in the arc of the discharge without even noticing a small increase in the temperature of the electrodes. All the frictional losses occur, then, practically in the air. If the exchange of the air molecules is prevented, as by enclosing the air hermetically, the gas inside of the vessel is brought quickly to a high temperature, even with a very small discharge. It is difficult to estimate how much of the energy is lost in sound waves, audible or not, in a powerful discharge. When the currents through the gap are large, the electrodes may become rapidly heated, but this is not a reliable measure of the energy wasted in the arc, as the loss through the gap itself may be comparatively small. The air or a gas in general is, at ordinary pressures at least, clearly not the best medium through which a disruptive discharge should occur. Air or other gas under great pressure is of course a much more suitable medium for the discharge gap. I have carried on long-continued experiments in this direction, unfortunately less practicable on account of the difficulties and expense in getting air under great pressure. But even if the medium in the discharge space is solid or liquid, still the same losses take place, though they are generally smaller, for just as soon as the arc is established, the solid or liquid is volatilized. Indeed, there is no body known which would not be disintegrated by the arc, and it is an open question among scientific men whether an arc discharge could occur at all in the air itself without the particles of the electrodes being torn off. When the current through the gap is very small and the arc very long, I believe that a relatively considerable amount of heat is taken up in the disintegration of the electrodes, which partially on this account may remain quite cold.

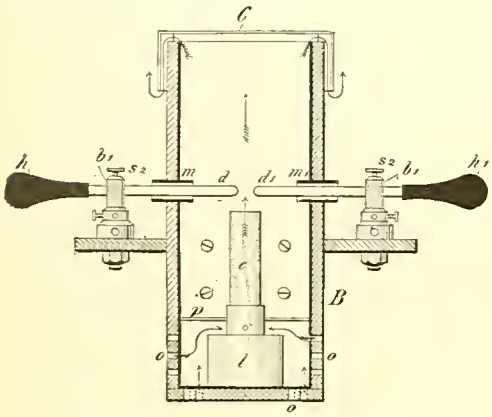

FIG. 3. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA. —DISCHARGES WITH HOT AIR DRAFT.

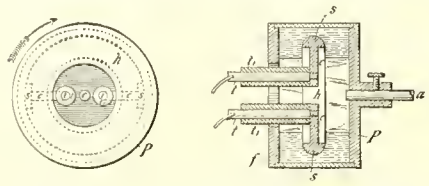
The ideal medium for a discharge gap should only crack, and the ideal electrode should be of some material which cannot be disintegrated. With small currents through the gap it is best to employ aluminum, but not when the currents are large. The disruptive break in the air, or more or less in any ordinary medium, is not of the nature of a crack, but it is rather comparable to the piercing of innumerable bullets through a mass offering great frictional resistance to the motion of the bullets, this involving considerable loss of energy. A medium which would merely crack when strained electrostatically—and this possibly might be the case with a perfect vacuum, that is, pure ether—would involve a very small loss in the gap, so small as to be entirely negligible, at least theoretically, because a crack may be produced by an infinitely small displacement. In exhausting an oblong bulb provided with two aluminum terminals with the greatest care I have succeeded in producing such a vacuum that the secondary discharge of a disruptive discharge coil would break through disruptively through the bulb in the form of fine spark streams. The curious point was that the discharge would completely ignore the terminals and start far behind the two aluminum plates which served as electrodes. This extraordinarily high vacuum could only be maintained for a very short while. To return to the ideal medium, think, for the sake of illustration, of a piece of glass or similar body clamped in a vise, and the latter tightened more and more. At a certain point a minute increase of the pressure will cause the glass to crack. The loss of energy involved in splitting the glass may be practically nothing, for though the force is great, the displacement need be but extremely small. Now imagine that the glass would possess the property of closing again perfectly the crack upon a minute diminution of the pressure. This is the way the dielectric in the discharge space should behave. But inasmuch as there would be always some loss in the gap the medium, which should be continuous, should exchange through the gap at a rapid rate. In the preceding example, the glass being perfectly closed, it would mean that the dielectric in the discharge space possesses a great insulating power; the glass being cracked, it would signify that the medium in the space is a good conductor. The dielectric should vary enormously in resistance by minute variations of the electromotive force across the discharge space. This condition is attained but in an extremely imperfect manner, by warming the air space to a certain critical temperature, dependent on the electromotive force across the gap or by otherwise impairing the insulating power of the air But as a matter of fact the air does never break down disruptively, if this term be rigorously interpreted, for before the sudden rush of the current occurs, there is always a weak current preceding it, which rises first gradually and then with comparative suddenness. That is the reason why the rate of change is very much greater when glass, for instance, is broken through, than when the break take place through an air space of equivalent dielectric strength. As a medium for the discharge space a solid or even a liquid would be preferable therefore. It is somewhat difficult to conceive of a solid body which will possess the property of closing instantly after it has been cracked. But a liquid, especially under great pressure, behaves practically like a solid, while it possesses the property of closing the crack. Hence it was thought that a liquid insulator might be more suitable as a dielectric than air. Following out this idea, a number of different forms of dischargers, in which a variety of such insulators, sometimes under great pressure were employed, have been experimented upon. It is thought sufficient to dwell in a few words upon one of the forms experimented upon. One of these dischargers is illustrated in Figs. 4*a* and 4*b*.



FIGS. 4*a* AND 4*b*. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—FORM OF DISCHARGER WITH LIQUID INTERRUPTER.

A hollow metal pulley *P* (Fig. 4*a*) was fastened upon an arbor *a*, which by suitable means was rotated at a considerable speed. In the inside of the pulley, but disconnected from the same, was supported a thin disc h_1 (which is shown thick for the sake of clearness), of hard rubber, in which there were embedded two metal segments *s s* with metallic extensions *e e*, into which were screwed conducting terminals *t t* covered with thick tubes of hard rubber *t t*. The rubber disc *h*, with its metallic segments *s s*, was finished in a lathe, and its entire surface highly polished so as to offer the smallest possible frictional resistance to the motion through a fluid. In the hollow of the pulley an insulating liquid, such as a thin oil, was poured so as to reach very nearly to the opening left in the flange *f*, which was screwed tightly on the front side of the pulley. The terminals *t t* were connected to the opposite coatings of a battery of condensers so that the discharge occured through the liquid. When the pulley was rotated the liquid was forced against the rim of the pulley and considerable fluid pressure resulted. In this simple way the discharge gap was filled with a medium which behaved practically like a solid, which possessed the quality of closing instantly upon the occurrence of the break, and which, moreover, was circulating through the gap at a rapid rate. Very powerful effects were produced by dischargers of this kind with liquid interrupters, of which a number of different forms were made. It was found that, as expected, a longer spark for a given length of wire was obtainable in this way than by using air as an interrupting device. Generally the speed, and therefore also the fluid pressure, was limited by reason of the fluid friction, in the form of discharger described, but the practically obtainable speed was more than sufficient to produce a number of breaks suitable for the circuits ordinarily used. In some instances the metal pulley *P* was provided with a few projections inwardly, and a definite number of breaks was then produced, which could be computed from the speed of rotation of the pulley. Experiments were also carried on with liquids of different insulating power with the view of reducing the loss in the arc. When an insulating liquid is moderately warmed the loss in the arc is diminished.

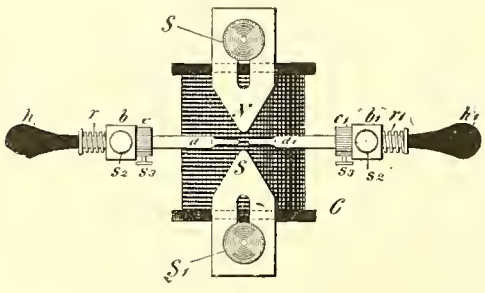


FIG. 2. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA. —FORM OF DISCHARGER WITH MAGNET USED IN THE DIRECT CURRENT CONVERSION.

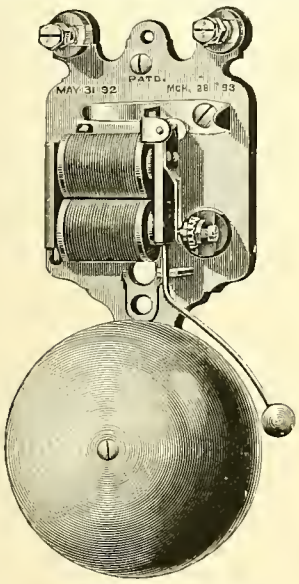
A point of some importance was noted in experiments with various dischargers of this kind. It was found, for instance, that whereas the conditions maintained in these forms were favorable for the production of a great spark length, the currents so obtained were not best suited to the production of light effects. Experience undoubtedly has shown, that for such purposes a harmonic rise and fall of the potential is preferable. Be it that a solid is rendered incandescent or phosphorescent, or be it that energy is transmitted by condenser coating through the glass, it is quite certain that a harmonically rising and falling potential produces less destructive action, and that the vaccum is more permanently maintained. This would be easily explained if it were ascertained that the process going on in an exhausted vessel is of an electrolytic nature.

In the diagrammatical sketch, Fig. 1, which has been already referred to, the cases which are most likely to be met with in practice are illustrated. One has at his disposal either direct or alternating currents from a supply station. It is convenient for an experimenter in an isolated laboratory to employ a machine *G* such as illustrated, capable of giving both kinds of currents. In such case it is also preferable to use a machine with multiple circuits, as in many experiments it is useful and convenient to have at one's disposal currents of different phases. In the sketch *D* represents the direct and *A* the alternating circuit. In each of these three branch circuits are shown, all of which are provided with double lines switches *s s s s s s*. Consider first the direct current conversion; *Ia* represents the simplest case. If the electromotive force of the generator is sufficient to break through a small air space, at least when the latter is warmed or otherwise rendered poorly insulating, there is no difficulty in maintaining a vibration with fair economy by judicious adjustment of the capacity, self-induction and resistance of the circuit *L* containing the devices *l l m*. The magnet *N S* can be in this case advantageously combined with the air space. The discharger *d d* with the magnet may be placed either way as indicated by the full or by the dotted lines. The circuit *Ia* with the connections and devices is supposed to possess dimensions such as are suitable for the maintenance of a vibration. But usually the electromotive force on the circuit or branch *Ia* will be something like 100 volts or so, and in this case it is not sufficient to break through the gap. Many different means may be use to remedy this by raising the electromotive force across the gap. The simplest is probably to insert a large self-induction coil in series with the circuit *L*. When the arc is established, as by the discharger, illustrated in Fig. 2, the magnet blows the arc out the instant it is formed. Now the extra current of the break, being of high electromotive force, breaks through the gap, and a path of low resistance for the dynamo current being again provided, there is a sudden rush of the current from the dynamo upon the weakening or subsidence of the extra current. This process is repeated in rapid succession, and in this manner I have maintained oscillation with as low as 50 volts, or even less, across the gap. But conversion on this plan is not to be recommended on account of the too heavy currents through the gap and consequent heating of the electrodes; besides, the frequencies obtained in this way are low, owing to the high self-induction necessarily associated with the circuit. It is very desirable to have the electromotive force as high as possible, first, in order to increase the economy of the conversion, and, secondly, to obtain high frequencies. The difference of potential in this electric oscillation is, of course, the equivalent of the stretching force in the mechanical vibration of the spring. To obtain very rapid vibration in a circuit of some inertia a great stretching force or difference of potential is necessary. Incidentally, when the electromotive force is very great, the condenser which is usually employed in connection with the circuit need have but a small capacity, and many other advantages are gained. With a view of raising the electromotive force to a many times greater value than obtainable from ordinary distribution circuits, a rotating transformer *g* is used, as indicated in Fig. 2*a*, or else a separate high potential machine is driven by means of a motor operated from the generator *G*. The latter plan is in fact preferable, as changes are easier made. The connections from the high tension winding are quite similar to those in branch 1*a* with the exception that a condenser *c*, which should be adjustable, is connected to the high tension circuit. Usually, also, an adjustable self-induction coil in series with the circuit has been employed in these experiments. When the tension of the currents is very high the magnet ordinarily used in connection with the discharger is of comparatively small value, as it is quite easy to adjust the dimensions of the circuit so that oscillation is maintained. The employment of a steady electromotive force in the high frequency conversion affords some advantages over the employment of alternating electromotive force, as the adjustments are much simpler and the action can be easier controlled. But unfortunately one is limited by the obtainable potential difference. The windings also break down easily in consequence of the sparks which form between the sections of the armature or commutator when a vigorous oscillation takes place. Besides, these transformers are expensive to build. It has been found by experience that it is best to follow the plan illustrated in Fig. 3*a*. In this arrangement a rotating transformer *g* is employed to convert the low tension direct currents into low frequency alternating currents, preferably also of small tension. The tension of the currents is then raised in a stationary transformer *T*. The secondary *s* of this transformer is connected to an adjustable condenser *C*, which discharges through the gap or discharger *dd*, placed in either of the ways indicated, through the primary *P* of a disruptive discharge coil, the high frequency currents being obtained from the secondary *S* of this coil, as described on previous occasions. This will undoubtedly be found the cheapest and most convenient way of converting direct currents.

The three branches of the circuit *A* represent the usual cases met in practice when alternating currents are converted. In Fig. 1*b* a condenser *C*, generally of large capacity, is connected to the circuit *L*, containing the devices *ll, mm*. The devices *m m* are supposed to be of high self induction, so as to bring the frequency of the circuit more

or less to that of the dynamo. In this instance the discharger *d d* should best have a number of makes and breaks per second equal to twice the frequency of the dynamo. If not so, then it should have at least a number equal to a multiple or even fraction of the dynamo frequency. It should be observed, referring to *1b*, that the the conversion to a high potential is also effected when the discharger *dd*, which is shown in the sketch, is omitted. But the effects which are produced by currents which rise instantly to high values, as in a disruptive discharge, are entirely different from those produced by dynamo currents which rise and fall harmonically. So, for instance, there might be in a given case a number of makes and breaks at *d d* equal to just twice the frequency of the dynamo, or in other words there may be the same number of fundamental oscillations as would be produced without the discharge gap, and there might even not be any quicker superimposed vibration; yet the differences of potential at the various points of the circuit, the impedence and other phenomena dependent upon the rate of change, will bear no similarity in the two cases. Thus, when working with currents discharging disruptively the element chiefly to be considered is not the frequency, as a student might be apt to believe, but the rate of change per unit of time. With low frequencies in a certain measure the same effects may be obtained as with high frequencies, provided the rate of change is sufficiently great. So if a low frequency current is raised to a potential of say 75,000 volts and the high tension current passed through a series of high resistance lamp filaments, the importance of the rarefied gas surrounding the filament is clearly noted, as will be seen later, or, if a low frequency current of several thousand amperes,is passed through a metal bar, striking phenomena of impedence are observed, just as with currents of high frequencies. But it is, of course, evident that with low frequency currents it is impossible to obtain such rates of change per unit of time as with high frequencies, hence the effects produced by the latter are much more prominent. It was deemed advisable to make the preceding remarks, inasmuch as many more recently described effects have been unwittingly identified with high frequencies. Frequency alone in reality does not mean anything, except when an undisturbed harmonic oscillation is considered.



HUEBEL & MANGER BELL.

In the branch *3b* a similar disposition as in *1b* is illustrated, with the difference that the currents discharging through the gap *dd* are used to induce currents in the secondary *S* of a transformer *T*. In such case the secondary should be provided with an adjustable condenser for the purpose of tuning it to the primary.

Fig. *2b* illustrates a plan of alternate current high frequency conversion, which is most frequently used and which is found to be most convenient. This plan has been dwelt upon in detail on previous occasions and need not be described here.

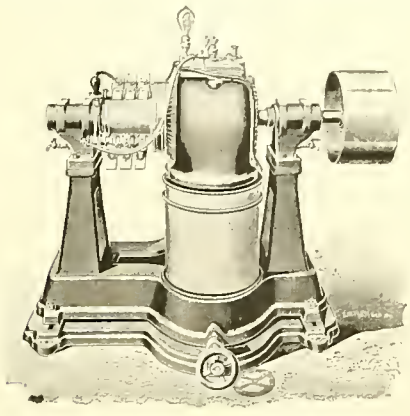
Some of these results were obtained by the use of a high frequency alteroator. A description of such machines will be found in my original paper before the American Institute of Electrical Engineers and in periodicals of that period.

Several extensive systems of electric railway are in a fair way to be built at once in the South. A number of Philadelphia capitalists have become interested in the line proposed between Dallas and Fort Worth, Tex., a distance of twenty-three miles. The Belt Electric company of Lexington, Ky., is considering the construction of an electric line from Lexington to Paris, a distance of eighteen miles. The estimated cost is $100,000, far less than the amount needed to build a steam power road. In Maryland, New York and Maryland capitalists have organized to build a road from Frederick to Middletown, Md., a distance of eight miles, with a possible extension along the Middletown valley. Surveys for the line have been made. In addition to the electric street railways in Washington, D. C., and its suburbs, surveys have been made for a line between Washington and Sandy Spring, Md., seventeen miles. Engineer H. B. Looker, who has located the route, says that it is intended to form one section of the proposed electric line between Washington and Baltimore via Ellicott City, Md.

New La Roche Direct Current Dynamo.

The cut herewith represents the new type of direct current dynamo built by the La Roche Electric Works of Philadelphia. This has been one of the most successful machines that has ever been turned out of the establishment, and for which the company has received a number of duplicate orders.

The machine is of the motor type, with Gramme ring armature of the latest improved construction, thereby reducing the speed very materially. It has all modern improvements, with all parts interchangeable and made to gauge. The machine is compound wound, and has been designed by F. A. La Roche. It has self oiling bearings and automatic oil-overflow. The brush holders are of a new design, and so made that any degree of tension can be secured, and so arranged that a free movement of the brushes around the commutator is allowed.



NEW LA ROCHE DIRECT CURRENT DYNAMO.

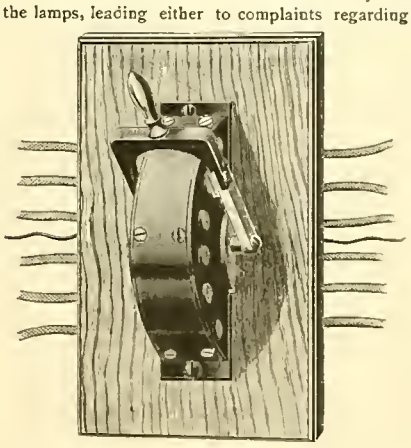
The commutator is made of specially hardened copper, well insulated with mica. It will be noticed that the winding of the machine is peculiar, as any of the coils, either series or shunt, can be removed and new ones put in place without interfering with any other part of the machine. An extra heavy steel shaft is used, thereby allowing no vibration and permitting the armature to run very close to the pole pieces, consequently increasing the efficiency of the machine.

At a test of one of these machines it was shown that there was a variation of only 1 3 10 volts between no load and full load.

Within the last three months the La Roche company has installed fifteen of these machines in Philadelphia and vicinity, and they are spoken of in the highest terms. The company is now making arrangements for an increase in its manufacturing facilities.

Cutter's Voltmeter Switch.

The average incandescent station has quite a number of separate circuits running from it, and in order to maintain the proper voltage on each of these, it has been the custom to have a voltmeter for each circuit. As first-class instruments are rather expensive the cheaper and more crude forms have almost always been used for this purpose. Of course, inaccurate voltmeters mean unsatisfactory service at the lamps, leading either to complaints regarding the light furnished or to a very short life of the lamps themselves. Any device that would allow a single and accurate voltmeter to be used with eight or ten circuits would do away with the faulty instruments and insure more satisfactory results.



CUTTER'S VOLTMETER SWITCH.

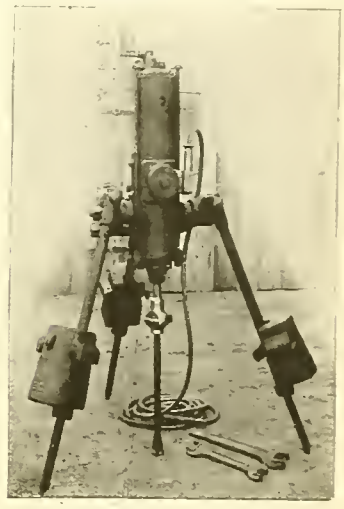
George Cutter of Chicago has perfected a special switch for this purpose, and practice has shown it to be well suited to the work. The size shown in the cut is used for connecting one voltmeter with any one of six circuits, while larger sizes can be used with as many as sixteen circuits. This voltmeter switch is nicely finished, so as to look well on any switchboard, and will no doubt create a large demand.

It is placed on the market by George Cutter, dealer in electrical specialties, 329 Rookery, Chicago.

Electric Percussion-Drill.

The electric percussion drill, since it was first put into practical operation, has undergone many changes, and today it can compete successfully either with the steam or compressed air drill. The manipulation of the drill, an illustration of which is presented in the accompanying cut, is in every respect as simple as that of the steam or air drill, stopping and starting being accomplished by merely throwing a handle to the right or to the left, making or breaking the contact between the cable and the terminals of the coils. Not the slightest difficulty is experienced in lubricating the wearing parts or in handling the drill. The generator which supplies the power is of the bipolar type, running at normal speed, and is provided with a device for directing the current alternately into the upper and lower coils of the drills. The difference of potential at the fixed brushes of the generator is 240 to 250 volts. The generator is belted to a 9 by 12 inch straight line engine, supplied with steam at 90 pounds pressure from a horizontal tubular boiler.

Three of these drills were recently installed by the General Electric company at the lime stone quarries of the Solvay Process company of Syracuse, N. Y. The plant has aroused wide spread interest among quarry operators, by whom it has been extensively inspected.



ELECTRIC PERCUSSION DRILL.

The Huebel & Manger Bell.

In the accompanying illustration is shown an electric bell recently devised by Huebel & Manger, of 286 Graham street, Brooklyn, N. Y., which contains a number of improvements over bells of this kind, which makes it quite worthy of mention and to merit the consideration of those interested in this line of electrical goods. There are two springs, as usual, one for the electrical contact and the other for adjustment. These are secured to the armature by the same rivets, and the end of the contact spring is rolled to form an eye which pivots on the mounting above which the cores of the magnets are riveted to the usual raised support at right angles to the base; the polar end of the cores has a flange which holds the magnet spools in place, and under one of the flanges is secured the pivotal mounting. There are grooves on the base to allow wires to be brought to binding posts. The end of the adjusting spring bears against a movable adjustable piece pivoted, and which is movable without loosening a screw, thus making easy adjustments. The binding posts and contact post are immovable. Contact points of platinum are riveted in spring and screw. Another improvement is a square washer in a rectangular depression under the binding post, thus enabling the termical wires to be secured without danger of being twisted off, which often happens when circular washers are used. The bell when finished is superior in every respect, and has already become quite widely known in the electrical trade.

It is reported that a line is being surveyed between Sausalito and San Rafael, Cal., for an electric road to be constructed by a citizen of San Francisco.

English View of the Incandescent Lamp Situation.

Those of our readers who have followed the events recorded in our past issues on electrical affairs in America will be aware that further lamp cases, instituted by the General Electric company were pending, says the London *Electrical Review*. The first of these since the one heard by Judge Colt at Boston came on for hearing on April 11th, and it was against the Columbia Incandescent Lamp company, a comparatively insignificant concern carrying on lamp manufacture at St. Louis. Public interest in the Goebel defense, which it was understood was again to be used, had begun to flag, and the case in question, after having been postponed more than once, attracted but little attention. The world is now startled by the news that the preliminary injunction demanded by the General company has been refused. It must be borne in mind that the opinion just delivered is merely a preliminary one which is based on the evidence of a number of affidavits and exhibits, and it therefore forms no certain criterion of the ultimate decision that may be arrived at, or of the effect it may have on the electric lighting industry generally. The ultimate conclusion can only be settled by a regular trial, which, unfortunately, will take a long time to prepare, owing to the numerous witnesses who will have to appear, and it is a question whether the Edison patent will not have expired before the case is finally disposed of. The decision just delivered does not even temporarily throw the market open to any material extent, since only the Columbia company and a few other undertakings, who have not yet been legally restrained, can continue to manufacture lamps. Those factories which have already been closed cannot, we understand, recommence work until the several injunctions laid on them have been removed, a proceeding which can only be effected by bringing the matter into court again in the various circuits on the ground of new evidence; and it is impossible to say whether Judge Colt and others would regard such evidence in the same manner that Judge Hallett has.

These circumstances, however, do not prevent the decision from being one of great moment, and the succeeding moves will be watched with intense interest all over the world.

We give a synopsis of the case elsewhere in this issue. It will be seen that the defense was argued in a most able manner by Mr. Kenyon, but, as a matter of fact, the case hung entirely on the Goebel story, the truth of which is, to our mind, still far from being conclusively proved. Several additional affidavits, 150 or more in all, and some fresh exhibits, were put in, but none of them had the uncontrovertible evidence that would have been contained for instance, by newspaper descriptions, illustrations or other documents. It is clear that there is falsehood on the one side or other, but without the assistance of searching cross examination it is difficult to ascertain on which side it exists. The testimony supporting the Goebel story is, it is true, exceedingly voluminous and consistent, while the attack on it by the plaintiffs, we admit, is very feeble. The story thus receives much indirect strength, but volumes of written evidence of this description is not necessarily actual proof in a case where perjury seems perfectly evident.

One weak point that strikes us in Mr. Kenyon's summing up is the explanation given for the Goebel matter not having been brought up in prior suits. The early knowledge of the matter is admitted by both defendants and plaintiffs. In the Boston trial, the reason given by Mr. Curtis for its non-use was that he did not sufficiently understand the extent to which Goebel had carried his experiments, and that had he known that evidence to the extent produced was forthcoming, it certainly would have been used; whilst on the other side the reason assigned was that Goebel was unreliable and had no old lamps to produce. The new explanation is that each side sought to hide the naked truth through self-interest. The Sawyer-Man company hoped to have its patents sustained, and the Edison company hoped to have its own triumphant, and thus it was to the interest of neither party to disclose the poor and unknown claimant to the incandescent lamp, and so let real equity reign. If interested motives are recognized as rational and sufficient reasons for hiding assured historical facts, what wonder that the affidavits presented on either side differ in their testimony in the manner they do; and on this ground what is there to prevent the whole Goebel story from being a fabrication?

Assuming the story to be true, there is no question that the defendant company is entitled to its victory. Judge Colt shirked the question in regard to the lamp exhibits Nos. 1, 2 and 3 by expressing the opinion that the devices were not practicable incandescent lamps, and that there was, therefore, no need to decide on their genuineness. He accordingly decided the case almost solely on the lamp exhibit, No. 4, which he held was not a genuine production. The question of the filamentary character of the carbon, which is manifestly used in the exhibits Nos. 1, 2 and 3, was not clearly put before the judge as being the crucial point at issue. But in the present case the principal argument was the one of the attenuated carbon of high resistance, being the only point of novelty in Edison's patent; and that if it could be shown that it had been used before as an illuminant, then the patent must necessarily be null and void from want of novelty.

The decision is naturally viewed in various aspects by the several persons who are interested in the lamp industry. While all of those who side against the policy of the General company are naturally more or less pleased at the result, they are by no means all convinced of the truth of the Goebel story—especially those who, like Ward Leonard, find it difficult to believe in modern miracles. On the other hand, one of the counsel representing the General Electric company is said to have expressed his views to the effect that while Judge Hallett's decision was unquestionably a reverse, it was regarded as only a temporary one. Similar injunctions had been refused to the Bell Telephone interests, but they had been without final effect; steps to bring the Columbia case to a final hearing will be vigorously proceeded with.

The statement made at the conclusion of the defendant's summing up to the effect that the plaintiffs have now a case before the Supreme Court, with the object of extending the life of Edison's patent until 1897, will come as a piece of interesting news to many persons in Europe.

CORRESPONDENCE.

New York Notes.

NEW YORK, June 3.—It will evidently take a long time for the trolley car to commend itself to the confidence of the average lay press. There have recently been some accidents on the Brooklyn electric roads, and the outcry against the trolley system, which had lulled for a while, has been raised again with renewed vigor. One of the leading dailies, an organ which is usually noted for its clear and intelligent view of things electrical, says: "But experience has shown that this peculiar device known as the trolley car, by reason of the powerful current of electricity used in operating it and the frequent difficulty of controlling its movements, is constantly liable to kill people. Its victims far outnumber those of capital punishment and are more numerous than those of the ordinary murderer in the same community. Exact statistics might show the trolley to be a rival of any epidemic disease by which we are wont to be visited. Is the killing of people by the deadly trolley any less manslaughter because the operating of that device is authorized by law or by the Railroad Commission?"

Another question to which the dailies have during the last few days given much attention is the measurement of current supplied to central station customers. For some time the customers of the Edison Illuminating company are said to have been complaining of excessive charges for current, that the meters used by the company are inaccurate, and that the charge for service is made by guesswork. The head of the firm who was dissatisfied with his bill suggests that provision be made by law for the settlement of differences arising from such fallible sources of a record as electric meters. His remedy is the appointment of state inspector to whom all disputes as to the consumption of electricity could be referred. The business of the electric companies is now so enormous that disputes must necessarily arise from time to time. It is contended that consumers should have some tribunal to which they can appeal in case of unreasonable or exorbitant charges and that until such a tribunal is established there will be no end to the disputes and vexatious lawsuits resulting from differences of opinion and defective meters in the transaction of the rapidly increasing business of the supply of electricity. Another correspondent maintains that this is unnecessary, for the meters supplied by the best houses to-day are thoroughly to be trusted. As an illustration he states that not long ago a company operating a large factory in this city found fault with its bill. It was said that the meter registered falsely. Another meter of a different type was put in, but the old one was also retained. After a month had elapsed a comparison was made, and one meter showed that $77.71 worth of electricity had been used, while the other, when computed, showed $77.87. It is believed that the complaints against the company in question are without reasonable foundation.

Capt. Griffin has taken the *Evening Post* severely to task for its statement concerning the General Electric company, that "the officers admit that a few weeks ago the company's financial situation was precarious," and for the further statement that the cash of the company on hand "outside of proceeds of these sales is $1,500,000, about one-half the amount reported as cash by its treasurer two weeks ago." Capt. Griffin says, with regard to the latter, that the General Electric company is not a banking institution and does not accumulate several millions of cash for the sole purpose of holding it indefinitely, but rather for the purpose of using it in its business and to discharge its proper business obligations. He continues: "I wish to say to you briefly that the officers and directors of this company, recognizing a few weeks ago that a determined attack was being made (apparently for speculative purposes) on the credit of this company, felt it incumbent upon them to consider whether such attacks, if persisted in, could by any possibility injure the company itself. It seemed to them that the wisest course was to take no risks in this respect, and they carried out this conclusion by converting into cash certain stocks, out of those which accrue to the company in the ordinary course of business, as a consideration for license rights granted to local companies. In this very simple way the purpose above indicated has been accomplished." A prompt retraction is then demanded, and the *Evening Post*, understanding "that the officers disavow the interview" on which its statement was based, withdraws it, and furthermore expresses its regret for having given currency to the statement "that the company's position was at one time precarious."

"A bona fide holder of 500 shares of the common stock of the General Electric Company" has written to a morning paper in reference to points connected with the recent sale by the company of about $2,000,000 of the stock of the New York Edison and the Boston Illuminating companies. He is evidently possessing his soul in patience through the stormy times on which the company's stock has lately fallen, for he says: "I am not in the market nor engaged in any 'bull' movement, but I know timid investors who have been frightened at a great loss out of their holdings. I myself have not sold a share, and shall not, unless unforeseen circumstances should oblige me to. I have been assured both yesterday and to-day (May 26th and 27th), by officers of the company that the dividend payable August 1st, is to be at the usual rate of 8 per cent."

C. W. Wetmore, the new president of the North American company, vice Henry Villard, resigned, has been practically the managing director of the company during the last two years, and has, according to those familiar with the affairs of the corporation, done a great deal toward repairing the damage the company sustained during the Baring panic. It is understood that the representation of Northern Pacific interests in its board will from this time on be reduced. Mr. Villard and one other Northern Pacific director, whose terms of office expire this year, will not be candidates for re-election. Their places will probably be filled by a representative stockholder, and by some one identified with the General Electric company, with which the North American company sustains close relations.

The indignation meeting which was to have been held on Monday evening at Madison Hall, for the purpose of protesting against the action of the Rapid Transit Commission, was postponed to Thursday in consequence of the somewhat tardy discovery that the hall was previously engaged. On Thursday evening, strange to say, it was found that the same mistake had been made again. A third adjournment was made to last evening, but the fliers which were printed announcing the date were not even distributed, and the attendance was so slim that the meeting was postponed indefinitely.

On account of the continued illness of Commissioner Spencer and the absence of Commissioner Inman from the city, the meeting of the Rapid Transit commissioners set for yesterday afternoon was postponed until next Wednesday at Commissioner Steinway's residence. During Mr. Steinway's illness the commission has been in the habit of meeting at his house, and many complaints have been made by persons interested in rapid transit that at these meetings reporters alone were able to gain admission. In connection with this a good story is told of Lawson N. Fuller, otherwise known as the "Sitting Bull of Washington Heights." Mr. Fuller takes great interest in rapid transit matters, and he presented himself at Mr. Steinway's residence at one of the meetings only to be told that none but reporters were admitted. Mr. Fuller accepted the situation, and learning the date of the next meeting, went to one of the newspaper offices, secured an assignment and reporter's badge, and again presented himself armed with credentials and was admitted to the meetings of the commission. It is said that the commissioners are anxious to have the work go on, and will probably have plans ready next Wednesday, so that all that will be necessary will be to make a choice between the two or three offered, and fix the date for the sale of its privileges. This is understood to mean that at the first meeting the commission will be in a position to do something definite and conclusive. It appears probable that soon after the meeting a sale will occur. It has been suggested that a proviso be enacted that will prevent the Manhattan people from "capturing" the new franchise either at the time of the bidding therefor or later. Both the *Herald* and the *Commercial Advertiser* assert squarely that the attitude of the Manhattan company justifies the city in declaring its charter forfeited, and advises that step in the public interest.

W. F. O.

Denver, Colo.

DENVER, COLO., June 3.—The tramway company recently changed its Broadway cable to an electric line. A similar change is expected to follow soon on the Colfax cable line. The Broadway line now gives all night service.

E. M. Burgess and Robert D. Hall of the Colorado Telephone company announce that the company will extend its line this summer from Leadville to Aspen, a dis-

tance of about 55 miles. The cost will be from $35,000 to $40,000.

Mayor Van Horn, it is said, intends to insist on a reduction in electric lighting charges. He believes that $10 a month is enough for arc lights on all night schedule. Heretofore, the city has been paying $12.50 a month.

The Park railway was recently absorbed by the tramway company, and the motive power changed from steam to electricity. The line is two and a half miles long, and connects with the Colfax cable at the loop running along the south and east sides of City park, to the northeast corner of the park; thence east on Alhambra avenue through Park Hill and More's Park Heights.

The Light & Power company, limited, has filed articles of incorporation. The incorporators are Ensign S. Wright, John M. S. Egan, Robert O. Old, Fred P. Dewey, P. L. Roberts, Fred R. Pneuman, and Casper S. Desch. The purpose of the company is to supply Clear Creek county, and particularly the towns of Georgetown and Silver Plume with electric and gas light, power and heat. The principal office of the company will be at Georgetown.

The Arapahoe Railway company has made a contract with a Chicago company for the construction of its new line. The line starts at Du Bois and Alameda avennes, a mile and a half east of Fairmount cemetery; thence runs along Alameda avenue to Hyde Park, up Hyde Park to Seventh avenue, west to Wisconsin avenue, and along Twelfth avenue to Colorado avenue, where it will connect with the tramway.

E. C. D.

PERSONAL.

Prof. Elihu Thomson and family are in Chicago, attending the World's Fair.

H. C. Thompson, representing the Electric Gas Lighting company, Boston, Mass., spent a few days in Chicago last week.

Charles Blizard, secretary of the Franklin Electric company of New York, was one of last week's visitors at the World's Fair.

C. E. L. Brown, of the Oerlikon Works, Switzerland, paid a flying visit to Chicago last week. Mr. Brown visited Jackson Park and expressed great admiration of the World's Fair.

NEW INCORPORATIONS.

Mason Electric company, New York, N. Y.; capital stock $25,000; to manufacture and sell electrical goods.

Hartman Manufacturing company, New York, N. Y.; capital stock, $25,000; to manufacture and sell gas and electric fixtures.

Virginia Traction company, Alexandria, Va.; capital stock, $100,000; to construct improvements and contract for real estate.

Cooperstown Gas & Electric company, Cooperstown, N. Y.; capital stock, $25,000; to manufacture and use gas and electricity.

Water, Light & Power company, Hot Springs, S. Dak.; capital stock, $100,000; to furnish light, heat, power and water; W. H. Train, Hot Springs, S. Dak.

Ida Grove Electric company, Ida Grove, Ia.; capital stock $15,000; to establish and maintain an electric plant for power and light; F. A. Lusk, Ida Grove, Ia.

Tyrone Electric Street Railway company, Tyrone, Pa.; capital stock, $300,000; constructing and operating an electric railway in Tyrone, Pa.; A. A. Stevens, Tyrone, Pa.

Milford Electric Light & Power Transmission company, Milford, Ill.; capital stock, $15,000; to erect, construct and maintain electric light and power plant; W. H. Mogg, Milford, Ill.

People's Street Railway company, Chester, Pa.; capital stock, $50,000; constructing and operating an electric railway in Chester, Delaware county, Pa.; John R. Hannum, Chester, Pa.

Rockport Electric Street Railway company, Rockport, Mass.; capital stock, $50,000; to construct and operate a railway by animal power or electricity, or any approved motive power other than steam.

Shenandoah & Mahanoy City Street Railway company, Ashland, Pa.; capital stock, $100,000; constructing and operating an electric railway in Schuylkill county, Pa; MacHenry Wilhelm, Ashland, Pa.

Cleveland Surgical & Electrical Instrument company, Cleveland, O.; capital stock, $25,000; manufacturing and dealing in surgical and electrical instruments, materials, etc.; Riley & McQuigg, Cleveland, O.

South Jersey Traction company, Bridgeton, N. J.; capital stock, $400,000; to construct and operate street railways or railroads operated as street railways and to regulate the same; W. H. Bacon, Bridgeton, N. J.

Fort Smith & Van Buren Electric Street Railway, Light & Power company, Fort Smith, Ark.; capital stock, $100,000; to build and operate an electric street railway from Van Buren to Fort Smith; Miles N. Beaty, Fort Smith, Ark.

Caracas Electric & Power company, Jersey City, N. J.; capital stock, $600,000; to construct, operate and maintain lines of electric wire, dynamos, poles, arc and incandescent lamps, etc.; Seward, Guthrie, Morawetz & Steele, New York, N. Y.

Lambertville Electric Light, Heat & Power company, Lambertville, N. J.; capital stock, $50,000; to sell, supply electric light, heat and power to persons desiring to purchase the same, etc.; G. W. Jacobs, Jr., 411 Walnut street, Philadelphia, Pa.

Allentown & Lehigh Valley Traction company, Allentown, Pa; capital stock, $1,500,000; constructing and operating motors and cables or other machinery for supplying motive power to passenger railways and apparatus for applying the same; Kauffman & Reninger, Allentown, Pa.

ELECTRIC LIGHTING.

Effingham, Ill., has voted $16,000 to buy an electric light plant.

The People's Electric Light & Power company, of Creston, Iowa, has been awarded the contract for the city lighting for a term of five years.

An artesian well is being sunk at Wildwood Beach, Pa., to furnish power for operating an electric light and railway plant which is shortly to be constructed.

A. A. Tibbe, superintendent of the electric light plant at Washington, Mo., is contemplating the introduction of an additional incandescent dynamo and engine for his plant.

Girard College, Philadelphia, Pa., is to have a complete electric lighting plant for the lighting of the building and grounds. An appropriation of $75,000 has been made for this purpose.

It is claimed that the new marine light which will soon be in place near Havre, France, will be the most powerful in the world. It will be visible at sea a distance of from twenty-two to fifty-two miles, according to the condition of the weather.

The manufacturing plant of the Canada Electric company of Amherst, N. S., has been sent to St. John, to augment the plant of the Consolidated Electric company. The Amherst company will henceforth confine its work to supplying light and power in Amherst.

The City Council of Belle Plaine, Ia., will receive sealed proposals until June 26, 1893, for lighting the city. The plant will have a capacity of at least twenty nominal two thousand candle power arc lamps, also for seven hundred sixteen candle power incandescent lamps.

The Edison Electric Light company of New York is excavating the foundation for an additional building in Pearl street contiguous to the present structure. It will be of brick, with a frontage of 75 feet, having a depth of 97 feet and a height of 50 feet. It will cost $50,000.

A boiler in the Eldora, Ia., electric light plant blew up last month, demolishing the building and two others. Dr. A. E. Gier was killed and several men were seriously injured. These works were completed about a year ago and cost $20,000. They were owned by Eldora business men and no insurance was carried. The total loss will probably reach $25,000.

ELECTRIC RAILWAYS.

A new electric railroad five and one-half miles in length is to be constructed at Calias, Me.

There is a project under consideration to construct an electric railway from Syracuse, N. Y., to Fayetteville.

The Norfolk Suburban Street Railway company has obtained a franchise for an electric road from Dedham Center to Hyde Park, Mass.

The Peekskill Surface Railway company, Peekskill, N. Y., will extend its lines to Lake Mohegan, Verplanck's Point and Van Cortlandtville.

It is understood that the Hot Springs, Ark., electric line will be extended to Oak Lawn and the Ouachita river, a distance of four and a half miles.

The City Railway company of Dayton, O., is constructing a new power house. About thirty-five miles is to be added to its electric railway system.

An electric road is to be built from Pleasure Bay, N. J., near Long Branch, to several towns and summer seaside resorts. The road is capitalized at $1,500,000.

The Montford avenue electric line of Asheville, N. C., has been sold to the Asheville Loan & Improvement company. It will extend it to the French Broad river.

It is said that the Terre Haute, Ind., electric street railway will be transferred to an eastern syndicate for $500,000, and that the company will build from eight to ten miles of extensions.

It is said that 1,000 miles of electric railroad will be put in this summer in Philadelphia. Work has been begun on the electric road that is to be built from Philadelphia to Harrisburg.

The Bergen Turnpike company, Hackensack, N. J., will build an electric railway from Hackensack to Hoboken. The trolley system will be used and the road will be nine miles in length.

The Fort Worth & Dallas Rapid Transit company of Fort Worth, Tex., will build an electric railway to connect with Dallas, and is asking a franchise from the city council of Fort Worth.

The citizens of North St. Louis are interesting themselves in projecting an electric road from a down town terminal through the northern part of the city to Jennings Heights and Walnut Hill, Mo.

A charter is asked in Rhode Island for the Newport, Middletown & Portsmouth electric road, which will extend to Tiverton from Newport, and then connect with the proposed line from Fall River to Taunton.

A movement is on foot among the business men of Mason, Bracken and Robertson counties, Ky., to secure stock and rights of way for a line of electric railway from Mt. Olivet to some point on the Chesapeake & Ohio road.

An electric street railway is to be constructed at South Waukegan, Ill., by a syndicate of Detroit and Chicago capitalists. The road is to be four miles in length and will extend to the manufacturing territory of South Waukegan.

The Nassau Electric Railway company, the Kings County Electric Railway company, and the Brooklyn City Railway company have made applications for franchises to operate electric surface cars along several streets and avenues of Brooklyn.

Considerable extensions to the electric lines in Milwaukee are contemplated and will shortly be begun, the Milwaukee Street Railway company and the Edison Electric company having gained control of the lines of the North American company.

About seventy miles of new electric railway tracking will be laid in and around Toronto this summer, for which over 300 new cars will be required. It is claimed that Toronto has one of the best operated electric car services in Canada. By next fall it will have 128 miles of electric car track and about 530 cars.

An electric street railway is now being built from St. Catharines, Canada, to Port Dalhousie, and will be running early in the summer. Dawson & Sims, the contractors, have bought the St. Catharines & Thorold electric road, which was the first of its kind in Canada, and will re-construct it. It is said another line will be run from St. Catharines to Niagara Falls.

TELEPHONE.

The Automatic Telephone & Electrical company of Canada proposes to run a copper metallic trunk line direct from Halifax to Vancouver, a distance of 3,500 miles. Local plants will also be established in towns and cities along the line.

The Providence Telephone company has begun the work of laying its wires underground. Under direction of Assistant Superintendent McClellan 318 feet of trenches has been dug, and over 1,500 feet of ducts laid from the corner of Plain and Point streets. The trenches are about four feet deep and situated midway between the water pipe and the curbstone. The ducts are laid five in a row, and each duct is equal to a capacity of 1,000 wires.

The largest center of telephonic communication in the United Kingdom, and one of the largest in Europe is that of Liverpool, where the National Telephone company has just completed its new switch room. This is a hall 90 feet in length, and is fitted in a way which completes nearly a million of telephonic connections, whereby each subscriber on the exchange may be placed immediately in connection with any other throughout the country. Already there are worked from the Liverpool center 9 600 miles of line, of which more than 7,000 are exchange and private wires. In 1882 the mileage of wires in Liverpool was only 463 miles; in February last it was 7,019. From the last published statistics it appears that the number of "calls" in the Liverpool center is 42,800 per day, representing a daily communication between 95,600 persons.

ELECTRIC MINING.

The Woodridge, Tenn., Jellico Coal company has contracted to put in an electric power plant and equip its mine with cars, etc., so as to do all the hauling by electricity.

The new Leavitt electric pumps with Thomson-Houston 1,000 volt motors and a capacity of 8,640,000 gallons in twenty-four hours were tested last month in the Calumet & Hecla electric light and power building, Calumet, Mich. The machinery worked well, coming fully up to the requirements in every particular. The pumps will be placed at the 33d level in Calumet No. 4 shaft. The electric pump in the South Hecla mine has been a success, giving perfect satisfaction. The Calomet & Hecla company owns a most extensive electric plant in its mines, and it has nearly every known form of electrical appliance in use. It has many miles of telephone lines on surface and underground, a complete telephone exchange and private line 'phones. In electric lighting it uses both the alternating and continuous currents with voltages ranging from fifty-two to one thousand. It also owns pumps, cranes, and some of the most perfect testing apparatus invented.

POWER TRANSMISSION.

In connection with the harnessing of Niagara Falls, the Hamilton Radical Electric Railway company of Hamilton, Ont., has been formed with the idea of using power transmitted from the falls to operate an extensive system of electric railways around Hamilton.

A claim on Nisqually Falls, Wash., has been filed by citizens of Tacoma, and a company is to be formed to expend $400,000 in building a power house and machinery to use the power of the falls in running electric plants in Tacoma. The estimated capacity of the falls is 10,000 horse power.

MISCELLANEOUS.

The apparatus for the electric fountain in Lincoln Park, Chicago, is now being replaced for the summer, and it is expected that this attraction will be open to the public the latter part of next week.

A recent dispatch from Asbury Park says that the new electric launch Bonaventure, which is to run on Deal Lake, made its trial trip on May 27th. It is 36 feet and 4 inches long. There are 120 storage battery cells in the vessel.

Madison Buell gave a brief and entertaining sketch of the career of Sir Humphrey Davy before the Buffalo Electrical Society on the evening of May 19th. Mr. Buell's paper was full of interesting matter and was received with pleasure.

At the recent convention of the Order of Railway Telegraphers at Toronto, Ont., it was decided to hold the next convention in Denver, Colo., in May, 1894. The association now numbers 26,000 members and holds $50,000 reserve in the protective fund.

The trustees of the Pueblo WaterWorks, Pueblo, Colo., recently closed a contract with the street railway company for the erection of an electric fountain, to be located at the Colorado Mineral palace. It will throw one stream 100 feet high and four others 75 feet high.

A new comer in the field of trade journalism is the *Canadian Engineer*, published in Toronto and Montreal, and devoted to the mechanical, mining, marine, locomotive, sanitary and other branches of engineering. The initial number comprises 28 pages and contains practical, bright and interesting articles. A special feature of this periodical is its Canadian news budget.

A press dispatch from Iowa City, Ia., dated June 2d says that the strike of the operators on the Chicago, Rock Island & Pacific railway last December Iowa City was made headquarters for many of the discontented men. At one time the wires of the affected railway were badly cut near that city and business much delayed. Three of the strikers, Albert Boone, C. W. Swords and William Jones were arrested, but on a preliminary examination were discharged. Boone and Swords at once began suit against the railway company for damages for large sums for false arrest. The cases are still pending, but last week Boone went before the court and pleaded guilty. The sentence was deferred.

One of the features of the equipment of the new armored cruiser New York will be an electric gig for the commanding officer, Captain John W. Phillips. It is being constructed by the General Electric Launch company and will be thirty feet long, six feet ten inches beam, and twenty-two inches draft. It will be capable of making a speed of about seven miles an hour for six or seven hours, with one set of storage batteries, although faster time can be made for a less number of hours. Her motive power will be sixty-four storage batteries, and the motor, placed under the floor of the cockpit, is directly connected to the Tobin bronze propeller shaft that is placed beneath the flooring.

TRADE NEWS.

The University of Pennsylvania has issued its annual catalogue. This institution has established quite an extensive course in electrical engineering.

The La Roche Electric Works of Philadelphia, in consequence of its growing business, is now making arrangements for increasing its manufacturing capacity.

Frank W. Harrington, who has been in charge of the Chicago office of the New York Insulated Wire company since November, returned last week to New York.

Manager A. C. Clark, of the Eastern Electric Light & Storage Battery company of Lowell, Mass., reports increased sales during the month of May for the Sorley storage battery over any month since the first of the year.

President E. F. Phillips, of the American Electrical Works of Providence, R. I., was in New York last week. He reports that work is progressing rapidly on the new factory which the company is erecting, and that business is brisk.

The Joseph Dixon Crucible company of Jersey City, N. J., is sending to its patrons a one-fold leaflet in which is contained the letter code of its grade stamps for the "Dixon" pencils, and also giving the uniformity of grading for use in offices, schools, counting rooms, etc.

The Novelty Electric company's new direct current 110 volt desk fan motor is meeting with large sales, being of high speed, very efficient and handsome in design. The company is also filling a number of orders for its alternating current desk fan motors. The fans are adjustable to any position desired.

General Manager E. S. Boggs, of the New York Electrical & Development company, reports increasing orders for his company's automatic electric lighter, and that it is very busy in the experimental and repair department on apparatus such as fan motors, dynamos, etc., which the company recently took up as a new department.

E. B. Duncan and J. S. Palmerlee have formed a partnership to engage in the electrical supply business in El Paso, Texas. Mr. Duncan was formerly with the Edison General company and in the office of the General Electric company at Louisville, Ky. Mr. Palmerlee is owner of the El Paso District telegraph and fire alarm system.

Large sales of Habirshaw wire during the past week are reported as having been made by the Ansonia Electric company, formerly the Electrical Supply company, Chicago. The good work done by the Wirt brush in saving commutators seems to be appreciated by the customers of this company, judging by the growth of the sale of the brush.

The Central Electric company is getting in large consignments of okonite, and is filling its orders promptly. The sales of okonite for the last month have been satisfactory, and the factory has had more than it could do to keep up with the demand. By increasing its facilities, adding new machinery and working overtime, it has been able to get abreast of the demand.

The Ries Electric Specialty company of Baltimore is very busy in pushing the manufacture of the new Reis & Scott single phase alternating current electric motors, which it is now making in sizes ranging from one-eighth to five horse power. These motors embody new features and are said to have many advantages. A modified type of this motor is made for fan work, of which the one-eighth and one-fourth horse power sizes are now ready for the market.

The Link Belt Machinery company extends an invitation to the trade to visit its works at the corner of Thirty ninth street and Stewart avenue, Chicago, and inspect its facilities for the manufacture of approved labor-saving machinery for transporting any material in bulk, or in boxes, barrels, bales and casks. This company, at whose works at Indianapolis, Ind., are manufactured all of the Ewart detachable link belting and Dodge chains, also owns a manufacturing plant at Chicago, where is made various kinds of general machinery as well as its link belt specialties. The company has an exhibit of freight and coal handling machinery in the transportation building annex, World's Fair, which is most interesting and illustrative of the company's devices.

Prof. C. B. Thwing, the university extension lecturer, and B. B. James of Evanston, Ill., are about to begin a series of lectures at the Chicago Athenæum, 26 Van Buren street, on the electrical exhibits at the World's Fair. The course will include four lectures, each lecture being designed, however, to be as complete as possible in itself. Prof. Thwing will speak on experimental exhibits and Mr. James on those pertaining to applied electricity. In addition to the lectures, these gentlemen will guide groups of from five to ten persons through the electrtity building, explaining the principal displays, noting their points of interest and importance. The lectures will be given upon every Monday and Wednesday evenings from seven to nine o'clock, and will no doubt prove of great interest.

BUSINESS.

The Wirt indicators, Wirt brushes and W. W. lightning arrestors, manufactured by the Ansonia Electric company, are attracting considerable attention from foreign visitors at the fair.

The Central Electric company reports having a run on fan motors. The Lundell motor made by the Interior Conduit & Insulation company, New York, which the Central company handles, is recognized as the most compact, noiseless and proper machine for keeping cool, and a big stock is carried, customers being supplied promptly.

The Henry R. Worthington company, of New York, had on exhibition in its office last week a set of pictures showing exterior and interior views of the Worthington Hydraulic Works at Brooklyn and Elizabethport, N. J. The pictures were bromide enlargements from original plates made by George P. Hall & Son, and are exceptionally fine pieces of photography. These pictures are to form part of this company's exhibit at the World's Fair. This company has about 65 distinct types of pumping engines at the fair, which pump about 80,000,000 gallons of water each day for use in different parts of the fair.

Last month the Waukesha Hygeia Mineral Springs company completed the line from the springs at Waukesha to the World's Fair grounds. The main line is over 100 miles long and the connections over 40 miles. The entire line is coated inside and out with the No. 1 P. & B. pipe coating compound, which, as reported by the company's chief engineer, J. W. Alvord, was the only material that would admit the piping of this water without imparting some disagreeable flavor. In fact Mr. Alvord says that but for the P. & B. pipe coating compound, the enterprise would have had to be abandoned. Reports from prominent chemists will shortly be published, giving full and critical analysis of the quality of the water, which as a matter of fact now reaches Chicago through the pipe line purer and fresher than when it was put into cans at the Springs and shipped to Chicago. The No. 1 P. & B. pipe coating compound is prepared by the Standard Paint company of New York city. The Chicago office is at 871 Rookery. This compound has attracted the attention of engineers and corporations interested in pipe coating on account of its great adhesive qualities, coupled with its odorless and tasteless properities.

ELECTRICAL PATENTS.

Issued May 30, 1893.

498,236. Telephone System. Emery A. Clark, Sioux City, Ia.

498,269. Electric Arc Lamp. Louis Hills, New York, N. Y.

498,289. Electrical Signaling System. Alfred S. McCaskey, Chicago, Ill.

498,290. Railway Block Signaling System. Alfred S. McCaskey, Chicago, Ill.

498,291. Automatic Telephone Exchange System. Alfred S. McCaskey, Chicago, Ill.

498,309. Telephone Transmitter. Charles F. Scattergood, Albany, N. Y.

The transmitter comprises a tube bent into U shape, one end of the tube being closed and free to vibrate, and the other fixed and opening into the speaking piece. The vibrations of the air produced by the voice cause the end of the tube to correspondingly vibrate. A button carried upon the free end of the tube bears against a carbon electrode included in an electric circuit with the button, the vibration thus produced causing the desired variation in resistance of the electric circuit.

498,312. Electric Lighting System. Charles E. Scribner, Chicago, Ill.

The system comprises means for controlling a lamp from two or more different points, so that at either the lamp may be turned on or off independently of the position of the switching devices at other points. When, for instance, it is desired to arrange a lamp so that it may be turned on or off from two distinct stations, a pair of contacts is provided at each station, the contact points being respectively connected together. The contact arm of one switch is connected to one side of the mains, and the contact arm of the other switch is connected to the other side after passing through the lamp. By this arrangement circuit through the lamp can be completed or broken by movement of the switch arm at either station.

498,327. Pole Piece for Dynamo-electric Machines. Elihu Thomson, Swampscott, Mass.

498,355. Trolley Catcher. Charles A. Lord, San Francisco, Cal.

498,372. Electric Registering Device. Barton B. Ward, New York, N. Y.

498,374. Adapter for Lamp Sockets. Henry P. Ball, Schenectady, N. Y.

498,387. Electric Arc Lamp. Frederick D'A. Goold, New York, N. Y.

498,407. Insulated Binding Post. Richard H. Rich, Beverly, Mass.

498,422. Galvanic Battery. William Burnley, North East, Pa.

The battery comprises an outer casing of zinc forming one electrode of the battery and an inner electrode surrounded by granulated carbon, filled in around the inner electrode loosely. Between the carbon and the zinc casing is included a plastic material containing the active substance for the battery. The object of the construction is to increase the surface of the positive element, thereby rendering the battery of longer active duration, since the surface of the positive element equals that of the solid electrode plus the surfaces of the various particles of granulated carbon. A large surface being thus presented, the battery will run longer without becoming polarized.

498,435. Electric Railway Trolley. Rudolph M. Hunter, Philadelphia, Pa.

498,437. Clearer for Slotted Conduits. John C. Love, Chicago, Ill.

498,448. Fire Alarm System. Joseph Sachs, New York, N. Y.

498,462. Electric Rotary Fan. Julian F. Denison, New Haven, Conn.

498,468. Electric Alarm Clock. William M. Fowler, Milford, Conn.

498,537. Dynamo-electric Machine. Charles E. Dressler, New York, N. Y.

498,538. Electric Generator or Motor. Charles E. Dressler, New York, N. Y.

498,539. Junction Block for Electric Fixtures. Frederic A. Duggan, Trenton, N. J.

498,550. Mail Receptacle. Andrew Holtum, Racine, Wis.

498,560. Electric Cut-out. William P. Mashinter,

498,566. Electric Arc Lamp. Paul Nordmann, Berlin, Germany.

The lamp is designed for use upon constant potential circuits, in which the potential is greater than that required for the lamp, and in which it has been usual heretofore to include resistances in circuit with the lamp. Two or more arcs are produced and regulated by the same feeding mechanism, the various arcs being included in series.

498,570. Suspension Device for Electric Lamps. James J. Renehan, New Britain, Conn.

498,573. Automatic Cut-off for Musical Instruments. Constantin Riegger, Louisville, Ky.

498,577. Electric Locomotive. Albert Schmid, Allegheny, Pa.

The motor frame is made in two parts, one part being hinged to the support at one end of the motor and the other part hinged to the support at the other end.

498,585. Electrical Rotary Motor. William J. Still, Toronto, Can.

498,603. System of Supplying Currents to Electric Railways. Charles Zipernowsky.

The system consists of an alternating current generator at the supply station connected with high tension mains extending to the consumption stations, at which points are provided transformers, consisting of an alternating motor in circuit with the high tension alternating mains and a continuous current dynamo, the armature being connected together in circuit with the secondary or low tension mains. Alternating currents, which are more cheaply transmitted long distances, are thus used on the high tension mains, and continuous currents, the more readily utilized for motor work, are used on the low tension or consumption mains. In order to start up any transformer continuous current from the common consumption circuits are sent through the dynamo, thus causing it to run as a motor until the speed is such that the alternating current motor may start when the dynamo acts to supply current to the consumption circuits.

498,604. Electric Arc Lamp. Hugh Alexander, Brooklyn, N. Y.

498,607. Operating Street or Station Indicators. Ruben B. Ayres, New York, N. Y.

498,624. Electric Car Brake. Nicholas J. Clute, Schenectady, N. Y.

498,674. Printing Telegraph. Donald Murray, Sydney, New South Wales.

498,710. Electric Time Alarm. Charles S. Gibson, South New Berlin, N. Y.

498,722. Trolley for Electric Cars. Robert D. Nuttall, Allegheny, Pa.

498,735. Electric Welding Apparatus. John H. Bassler, Myerstown, Pa.

498,743. Galvanic Battery and Electrical Toy Instrument. William A. Connelly, Boston, Mass.

EUGENE F. PHILLIPS, Prest. W. A. HATHAWAY, Treas. W. H. SAWYER, Sec'y.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

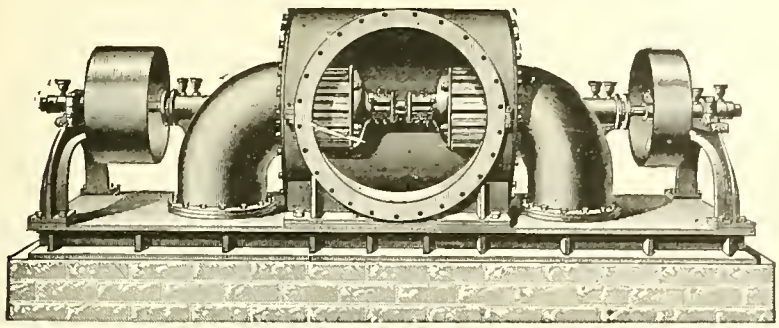
VICTOR TURBINE WATER WHEEL.



The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use on account of its **remarkably steady motion, high Speed and great Efficiency,** and **large Capacity** for its **diameter,** being **double** the **Power** of most wheels of same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

Our Horizontal "Victor" is highly recommended, as no gears are required and it can be belted directly to dynamo.

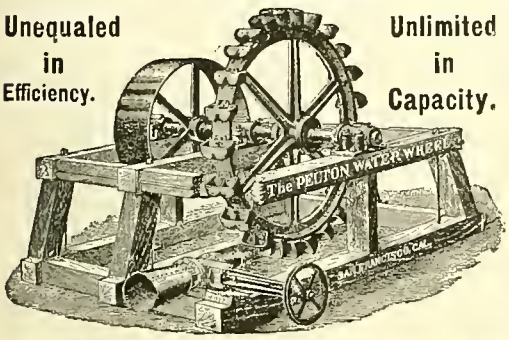
The accompanying engraving represents a pair of 12 inch **VICTOR TURBINES** arranged on a horizontal shaft with Cast-Iron Flume, Draft Tubes, End Bearings for Shaft and Driving Pulleys complete, all mounted upon a substantial cast-iron bed plate. The entire arrangement is very complete and strictly first-class in every particular. We are now prepared to furnish Victor Turbines, either single or in pairs on horizontal shafts, and where the situation admits of their use, we recommend them.

STILWELL & BIERCE MFG. CO., DAYTON, OHIO.

THE PELTON WATER WHEEL.

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 hp to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage,** and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

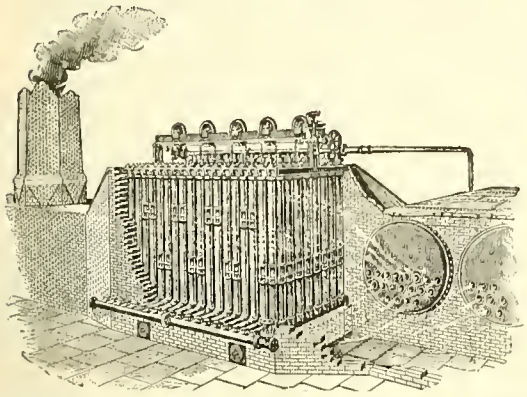
THE FUEL ECONOMIZER CO.,

Of Matteawan,

SOLE MAKERS IN THE UNITED STATES OF

GREEN'S IMPROVED PATENT ECONOMIZER

FOR STEAM BOILERS.



Now working at the Power Plant of the Intramural R. R., Jackson Park, S. E. cor. of the Exhibition Grounds, and can be seen and described at Sec. 25, column K-M-22 Machinery Hall.

TO ALL ELECTRICAL ENGINEERS:—The large reserve of water, at a high temperature, held in the Economizer to meet the sudden demands common to all Electric Railroads, renders an Economizer absolutely indispensible to the modern power plant of the present day.

Can be applied to any kind of boiler without stoppage of works.

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin.

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 61¼ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $24,193.56, with interest from the 22d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,

Receiver of the Milwaukee Electric Railway Company.

NEW BOOKS! — JUST OUT OF PRESS.

NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practicel dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS. "TRAMS."

Their Construction, Operation and Maintenance.

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.

Experiments with Alternate Currents.

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages. 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

THE
Redding Electric Co.,
336 CONGRESS ST.,
Boston, Mass.

WE DESIRE TO ANNOUNCE that we have added to our business a department of

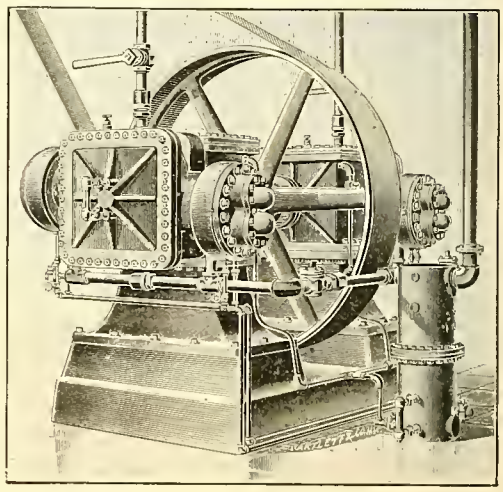
Ice Making and Refrigeration

in which field we recognize a demand for as high-class Engineering as we have been accustomed to give to the construction of Steam Power Plants. This department is distinct in its organization, with headquarters at our Boston Office, 620 Atlantic Avenue, under the immediate management of Mr. Church, with Frederick E. Murphy in executive authority as Engineer in charge.

After an investigation covering a period of two years, and conducted in the interests of our own proposed investment we have acquired control, by Exclusive License, of the Compressor and Condenser patented by Messrs. Hodges and Havenstrite, of Boston. Staking our reputation as judges of successful machinery, we offer them as the most mechanical, adaptable and economical apparatus for the purpose, thus far placed on the market.

The proportioning and construction of the distribution system, on which the successful working of both Ice-making and Refrigerating plants so largely depends, will be carried out consistently with the reputation for good engineering and good work which we enjoy.

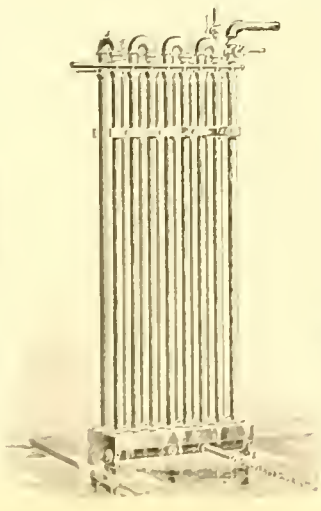
We are now prepared to contract for Plants for the manufacture of



ARTIFICIAL ICE

having any capacity from one-half ton to one hundred tons per day and upward. Artificial Ice has come to stay, equally for sanitary and economic reasons, and its manufacture is a stable and profitable enterprise, competing successfully against the natural product.

ARTIFICIAL REFRIGERATION



will receive our especial attention. In cold Storage Warehouses, Breweries, Packing Houses, and similar large Industries, it is already an established necessity. Into this class of plants we bring for the first time the manifest advantages of small space and headroom, and the subdivision of units, which last is the only means whereby a Refrigerating Plant can meet the fluctuations of the seasons with anything like uniform efficiency.

Refrigeration or combined Refrigeration and Ice-making, in an all plants from one-half ton to ten tons per day, is now cheap and practicable, and this particular trade will be fully developed by us in its application to Markets, Creameries, Hotels, Apartment Houses, Hospitals, and Manufacturing processes of all kinds. In this latter field, we believe ourselves without successful competition.

Correspondence regarding any application of Artificial Cold will be to the mutual advantage of our customers and ourselves.

Very respectfully,

WESTINGHOUSE, CHURCH, KERR & CO.,

Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A.M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

The Scheme of Treatment is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS**, to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

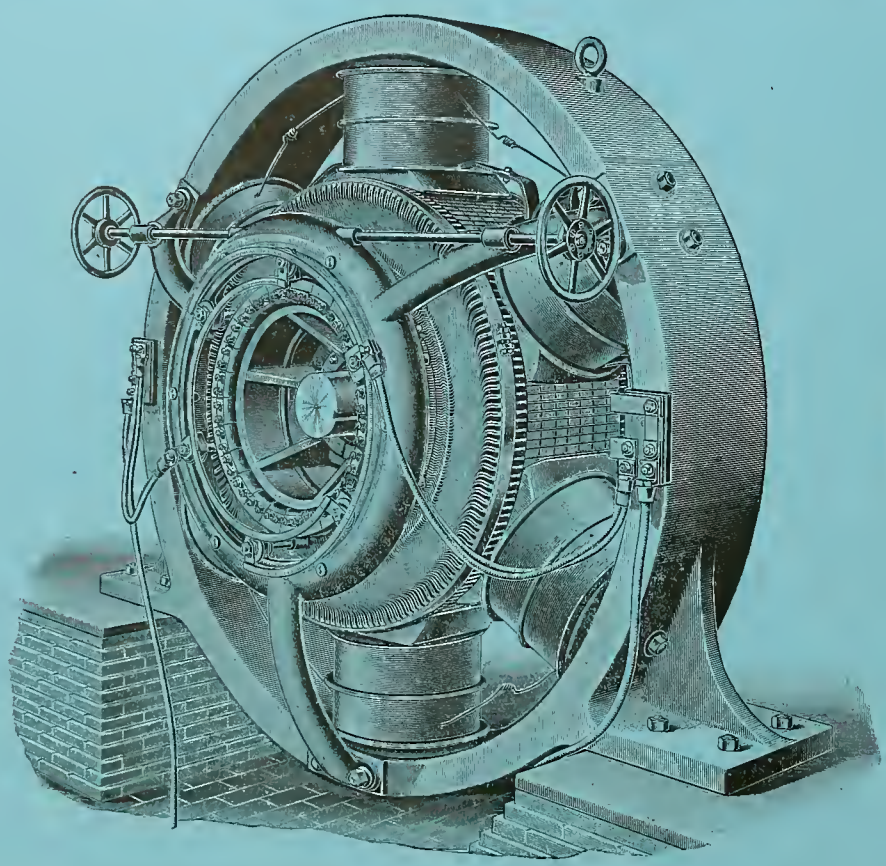
DIRECT-CONNECTED

MULTIPOLAR GENERATORS

FOR LIGHT OR POWER.



Efficient. Economical.

ELECTRICALLY AND MECHANICALLY PERFECT.

These Generators have been designed for use in stations situated in populous centers, where real estate is costly, and restricted space a necessity. By their use the full economy of steam is realized, the expense of belts and counter-shafting and loss by friction eliminated, and attention is reduced to a minimum.

These Generators have been installed in electrical stations in New York, Boston, Brooklyn, and in many of the other large cities in the United States, in each case not only fully meeting, but even exceeding requirements. They are to-day the highest development of dynamo construction.

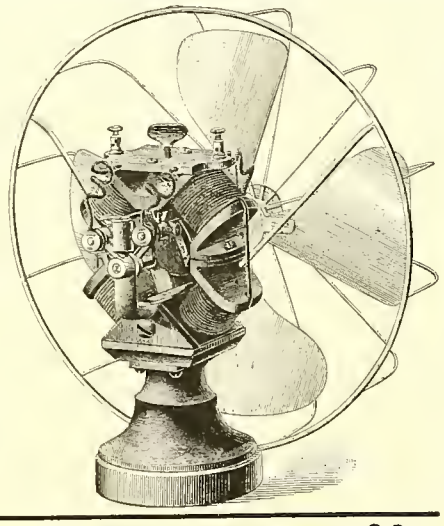
THE ATLANTIC FAN MOTOR—1893.

With 10-inch Fan, Fan-guard and Switch.

The Latest Fan Motor.
Novel and Original Construction.
Unequaled by any Fan Motor
Made for Battery Current, 4 Volts.



ATLANTIC PRIMARY BATTERY,

India Rubber Cells.
6½ x 7 x 8 Inches High.

The best and most economical Battery for running Fan Motors, sewing and dental machines, phonographs, etc. It is neat, compact and efficient.

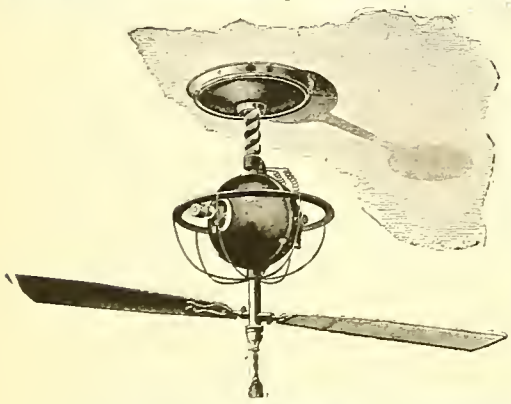
CUTLER & HAMMER, 313 S. Canal St., Chicago.

Expert Electrical Work.

Lundell Ceiling Fan Outfit No. 569c.



SPECIFICATION:

1-6 H. P. Lundell Fan Motor, speed of motor 1,500 revolutions per minute at 110 volts. Speed of fan 165 revolutions per minute for *constant potential, incandescent circuits* up to 120 volts, self-oiling and self-aligning bearings, 27-inch fan blades. Motor finished in black japan, with red and gold striping. Stem and canopy, antique polished brass. Standard length from ceiling to switch 4½ feet.

List Price, $52.00.

Discounts furnished upon application.

ILLUMINATED DIAL POTENTIAL INDICATOR, (ONE-HALF SIZE.)

By a modification of the Station Voltmeter a deflection per volt of ⅝ inch can be obtained. The instrument ie absolutely dead-best and fully as accurate as our Portable Direct-Reading Standard Voltmeter.

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixte n different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and a e very accurate and well made. The scales are very regular, the instruments very sensitive, tho oughly durable and absolutely permanent, and their indications are n t sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

In three sizes and many ranges. These instruments are very dead beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

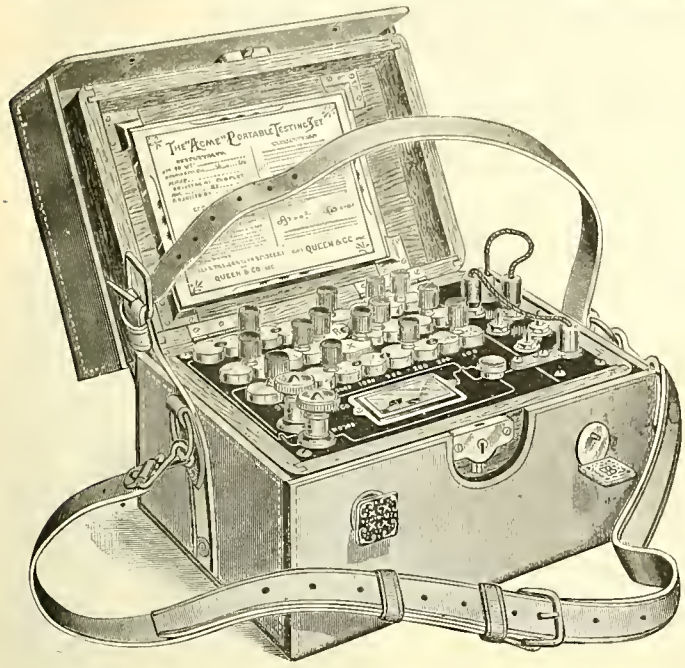
in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never bee approached. A 1,200 ampere instrumen t will indicate, with full load or no load, the turning on or off of a sing'e lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

THE WESTON ELECTRICAL INSTRUMENT CO.,

114-120 William St., Newark, N. J., U. S. A.

CORRESPONDENCE SOLICITED.



OUR LATEST SPECIALTY:

The Acme Portable Testing Set.

Is the most COMPACT, COMPLETE, CONVENIENT and ACCURATE portable resistance set ever placed on the market, and as such strongly appeals to CONSTRUCTION and INSPECTING ENGINEERS, STATION SUPERINTENDENTS, TELEGRAPH and TELEPHONE MANAGERS, MANUFACTURERS OF DYNAMOS, MOTORS, LAMPS and GENERAL SUPPLIES.

It compriaes: WHEATSTONE BRIDGE, RHEOSTAT, D'ARSONVAL DEAD-BEAT GALVANOMETER, and ALUMINUM IODINE BATTERY of twelve cells, all in a handsome mahogany box, 8¼ in. x 5¾ in. x 5 in., and weighs LESS THAN SIX POUNDS.

MAGNETIC FIELDS and MECHANICAL VIBRATIONS produce no visible effect, and tests can be made as ACCURATELY in a DYNAMO ROOM or on SHIPBOARD as in a college LABORATORY.

Correspondence is invited with interested parties who should write us for descriptive circular No. 445.

THE SET CAN BE OBTAINED FROM THE TRADE GENERALLY AS A STANDARD ARTICLE.

STANDARD APPARATUS AT THE WORLD'S FAIR.

Our handsome exhibit, ELECTRICITY BUILDING, GROUND FLOOR, NORTH END, contains a full line of Specialties in Standard Measuring Instruments, to a careful examination of which THE PUBLIC IS CORDIALLY INVITED. Some pieces of new design, such as the "Acme" Testing Sets, Cable Testing Sets, Conductivity Bridge, Ryan Electrometers, Condensers, D'Arsonval Galvanometers, Testing Batteries, etc., have already attracted DESERVED NOTICE.

The EXPERTS in charge will always be pleased to show EVERY ATTENTION to our many friends.

FORT WAYNE ELECTRIC COMPANY,

FORT WAYNE, IND.

Manufacturers of Apparatus for Arc Lighting; Alternating Current Lighting; Direct Current Incandescent Lighting; Generators for Railway and other Motor Circuits; Accurate Measuring Instruments, Meters and General Supplies. This apparatus possesses the highest Electrical Efficiency, best Mechanical Construction, and the most Artistic Design.

The Armature of the new "Wood" Iron Clad Slow Speed Alternator is indestructible. These dynamos are being manufactured in the following sizes: 750 light, 1,500 light, 3,000 light and 6,000 light capacity.

Twenty-six styles "Wood" Arc Lamps for Constant Current Circuits, Constant Potential Circuits and Alternating Circuits. Noiseless, no extra rheostat.

The largest stations in existence are of the Fort Wayne Company's System.

See our Apparatus in operation at our World's Fair Exhibit.

EVERY SATURDAY.

Vol. XII. CHICAGO, JUNE 17, 1893. No. 24

Electricity at the World's Fair.

Among the noteworthy electrical features at the World's Fair one of the most remarkable is the five-foot Schuckert search-light projector which is mounted on the northwestern corner of the roof promenade on the manufactures building, and which is in operation on every Tuesday, Thursday and Saturday evening. There seems to be no question that this is the largest projector ever made, and it is asserted that the light from it will be easily seen, under favorable conditions, at Milwaukee, over eighty miles away.

This lamp, which was made especially for the World's Columbian Exposition, was manufactured by Schuckert & Co., of Nuremberg, Germany, and is in charge of Fred W. Tischendoerfer, the World's Fair representative of this firm. Completely mounted, it stands about eight and one-half feet above the platform on which it is erected. An idea of its size may be gained by comparison with the man standing beside it in the illustration. The parabolic mirror, which perhaps constitutes the most important part of the lamp, has a working diameter of five feet with a thickness of about 7/8 of an inch, and six

The feed of the carbons, which are placed in the lamp in a direction parallel to the axis of the drum, is automatically accomplished, and a device is also provided by means of which the carbons are separated and the arc established automatically, so that it is only necessary to turn on the current to get the full force of the light at once. The positive carbon is 33 millimeters in diameter and the negative carbon 26 millimeters. The lamp can be worked by hand, as is done at present, or by means of electric motors placed under the base of the stand, which can be operated some distance away if

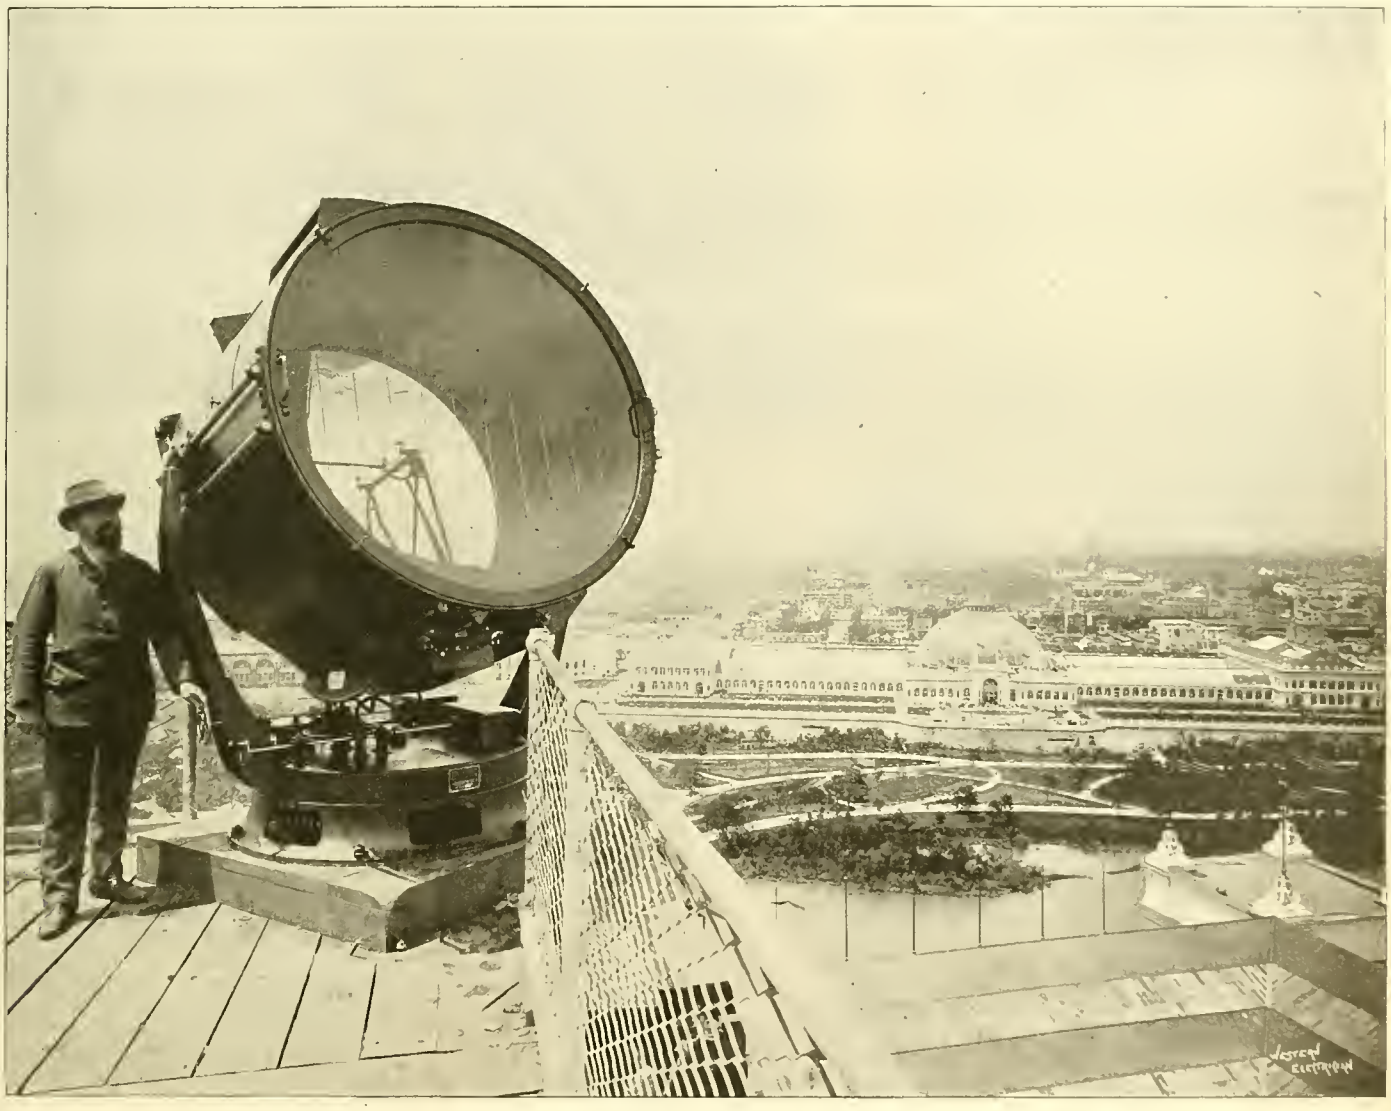

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—THE GREAT SCHUCKERT PROJECTOR ON THE MANUFACTURES BUILDING.

The illustration on this page shows the big lamp as mounted in its present position. The background is formed by the view of the exposition grounds and surrounding country visible from the lofty perch, 230 feet above the ground, on which the search-light is placed. The building most prominently shown is horticultural hall, in front of which the winding paths of the wooded island can be plainly discerned. To the right the lofty structure of the Ferris revolving wheel can be easily distinguished. At the time the photograph was taken the projector was pointed in such a direction that an inverted reflection of the battle-ship and the British government building could be seen in the parabolic mirror. This also may be detected in the reproduction by the close observer.

months was consumed in the labor of grinding and polishing it. The back is heavily coated with silver, protected by a specially prepared paint. The mirror is fastened by springs in the drum so as to provide for expansion due to the heat. Exhaustive experiments have demonstrated that the parabolic glass mirror is the most perfect method for projecting the rays of an arc lamp for search-light purposes, as it not only takes up the greater part of the rays from the crater of the arc, but is also best adapted for the reflection of the most intense rays. It utilizes in the highest degree and with the greatest efficiency the useful spheric angle of the light. It seems therefore to be assured that whatever improvement may be made in search-lights in the future the parabolic mirror will form an integral portion of the mechanism of the lamp.

necessary. In order to secure the best effect and a steady light the positive carbon is made with a core of soft glass, thus producing at all times a regularly proportioned crater. The ratio of the cross-sections of the positive and negative carbons is such that both are burned away equally, thus keeping the focus of the lamp always in the same position. Means are provided, however, by which the focus of the lamp can be easily changed to obtain divergence of the rays, convergence or a beam of concentrated light. The arc can be seen from the outside of the drum by means of angle mirrors and colored glass slides and is thus capable of easy regulation. The drum containing the mechanism of the lamp presents a dull black surface both inside and out. It is thoroughly ventilated in a manner which does not affect the arc and at the same time prevents over-heat-

ing of the mirror. It can be turned in any direction, either horizontally or vertically. The current is supplied from a dynamo in machinery hall, the feeders being laid in subways to the manufactures building, where they are conducted upward on the iron trusses supporting the roof.

The current strength for the big lamp is 150 amperes at a potential of 60 volts at the lamp terminals, and No. 0000 wire is used for the conductors. It is calculated that the strength of the arc itself is 47,000 candle power, which is magnified on the surface of the mirror to 194,000,000 candle power.

Beside the big projector the firm exhibits three other search-lights on the roof of the manufactures building, with projector diameters of respectively four, three and two feet. Each search light is provided with an adjacent switch-house, equipped with a water-proof cover, containing resistance coils, measuring instruments, safety fuses, cut-outs and tools used about the lamps. Two of the lamps are as yet unprovided with feeders, but in a short time all four will be in operation three nights every week. As soon as the weather is clear Mr. Tischendoerfer purposes to make some tests to display the strength of the light from his big lamp, and it is confidently expected that some astonishing results will be obtained.

The large electric sign of the Westinghouse company on the southern wall of the electricity building is nearing completion, and a good idea of its final appearance may now be gained. The central feature is a massive head of Columbus, closely studded with incandescent lamps, so that at night the features of the great discoverer will stand out as a picture of light. The flesh tints are represented by pink lamps, the hair by white and the frock by blue. The portrait is 18 feet high. Above it, arranged in a semi-circle, are the words, "Westinghouse Electric & Manufacturing Co.," while below is the name 'Columbus," with "1492" and "1892" on either side. The lettering is outlined by lamps of clear glass. The decoration can hardly fail to excite much attention. It was designed by W. G. Walter.

In the whole exposition there are few more interesting exhibits than that made by the navy department on the model battle-ship Illinois. To the electrical man the lighting features possess an especial attraction, but before passing to the consideration of the electrical plant a few words descriptive of this unique piece of naval architecture must be prefaced. The structure is a full sized model above the water line of the Oregon type of battle-ships now building for the United States navy. These vessels have a length on load-water line of 348 feet; extreme breadth, 69¼ feet; displacement, 10,231 tons; maximum indicated horse power, 9,000; estimated sea speed, 15 knots. The main battery consists of four 13-inch rifles, mounted in pairs in turrets forward and aft on the main deck, together with eight eight-inch rifles mounted in pairs in turrets on each side of the superstructure deck, forward and aft, and four six-inch rifles. The secondary battery is efficient, and provision is made for the discharge of torpedoes and for ramming. The ship is protected by heavy armor, ranging from 18 to five inches in thickness.

The Illinois is built in Lake Michigan, opposite Fifty-ninth street, Jackson Park, on a substantial foundation of piling and heavy timbers. The sides of the hull, up to the line of the main deck, are built of brick, and are shaped accurately to the lines of the vessel, and finished inside and outside with a heavy coating of cement. The sides of the superstructure, the redoubts, and the 13-inch and eight-inch barbettes, turrets and guns are constructed of wood framing, covered with cement worked over metal lathing. Other parts are, in most cases, of similar material to that used in the construction of the coast-line battle-ships. Nothing is shown below the berth deck, which rests on the timber framing over pile heads, rendering it impossible to exhibit the boilers and machinery. The berth deck is the exhibit space proper, and on it are to be found the greater part of all the exhibits. All the principal fittings of a modern war vessel are shown in their places, and although many alterations in the plans of the originals have been made (between decks especially), due to the double function of the structure, as an exhibit of itself and to house the exhibit of the navy department, the Illinois is a faithful reproduction, in appearance, of the coast-line battle-ships. An excellent picture of the ship, taken from the most recent photograph, is shown in Fig. 2.

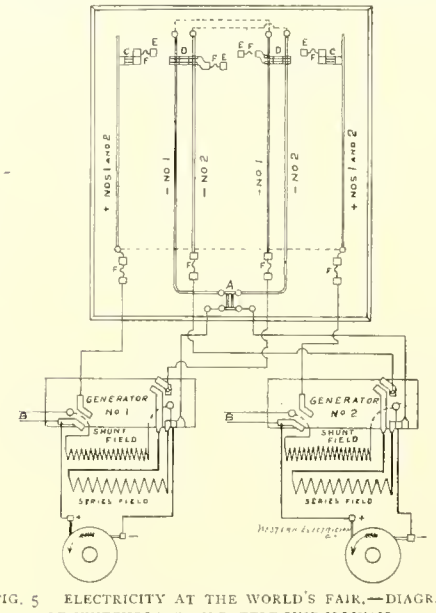

FIG. 5 ELECTRICITY AT THE WORLD'S FAIR.—DIAGRAM OF SWITCHBOARD ON BATTLE-SHIP ILLINOIS.

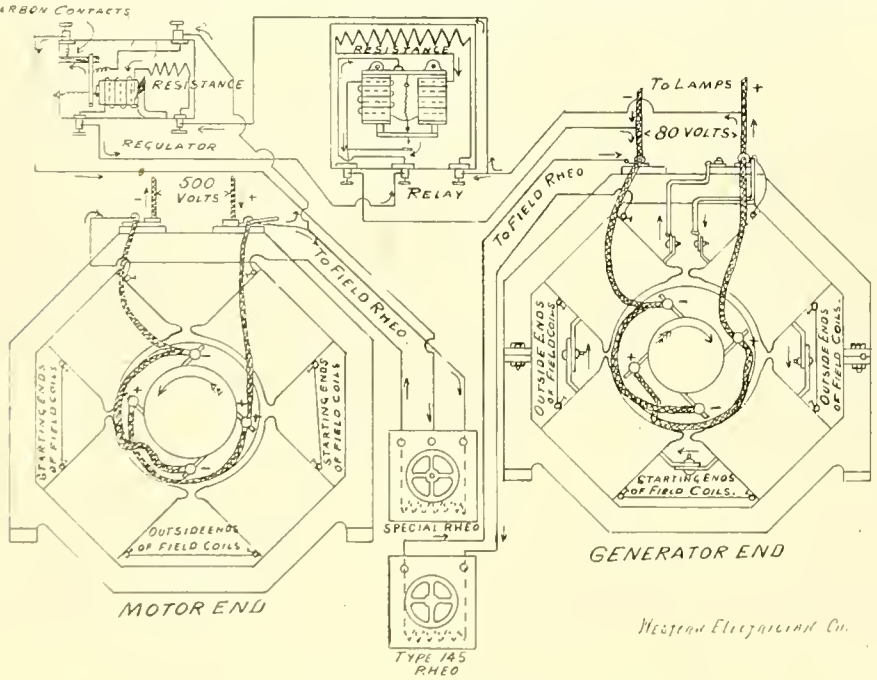

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—DIAGRAM OF CONNECTIONS OF THE MOTOR GENERATOR ON THE BATTLE-SHIP ILLINOIS.

The electrical plant is located on the berth deck, a wiring plan of which is shown in Fig. 3, the varying styles of fixtures being indicated by different characters. It provides current for 350 16 candle power incandescent lamps, two 38,000 candle power search-lights and a few motors. In the ships of which the Illinois is a model the plant consists of two 16 kilowatt marine generating sets of the General Electric company's type, the dynamos being multipolar and directly coupled to engines. Two of these sets have been duly installed on the "brick steamship" in the space indicated on the plan, Fig. 3. In the absence of steam on the vessel, however, these engines and dynamos perform no actual service, but are merely shown as exhibits. Occasionally the dynamo of one set is run as a motor to give visitors an idea of its operation. The real work is done by a motor generator, located just forward of the marine sets. This consists of a 500 volt, multipolar, 50 horse power motor, directly coupled to an 80 volt, 32 kilowatt multipolar dynamo, the whole constituting a direct current transformer, by which the 500 volt current taken from the intramural railway circuits at the end of the pier is reduced to a pressure of 80 volts, the regulation navy standard. In order to overcome the fluctuations of current occurring on an electric railroad line it was found necessary to employ a wall controller especially designed for this purpose. This device is operated automatically, and cuts resistance in and out of the shunt winding of the motor. The connections of the motor and generator, with the wall controller, are shown diagrammatically in Fig. 4. All the wiring has been done in strict accordance with the requirements of permanent naval work, and the whole plant, indeed, may be regarded as the most thorough specimen of marine electrical work thus far undertaken at a point so far inland as Chicago. A diagram of the switchboard is shown in Fig. 5. The wiring is on the water-tight system, and all the fixtures are water-tight. In the junction boxes, for instance, the wires pass through rubber glands and the top is secured down on a rubber gasket. A group of the electric fixtures used on the Illinois is illustrated in Fig. 6. Beginning on the left is a signal lantern, next is an officer's desk light, while farther to the right is a round ceiling fixture showing above an Ardois signalling lantern of red and white. Next is a battle lantern, which has a slide, so that the light may be completely hidden during an engagement, when these lanterns would be brought into play in manipulating the guns. Farther on is a bulkhead fixture, with a portable lamp just below it and a deck lantern to the right. The big fixture that comes next contains one of the running lights—the lights placed on the bows of all vessels in navigable waters to indicate, by their color and position, the course of the vessel at night—and in this case being the red or port lantern. The fixture farthest to the right, and the tallest of all, contains a magazine light, by means of which the ammunition magazines are lighted. The rule against admitting fire into the powder magazines is extremely rigorous, and so these rooms are lighted by square fixtures, which are placed in niches in the outer walls of the magazines, the light shining into the rooms through round bull's-eye windows.

There are two search-lights, one on the pilot house, port side, and the other on top of the hammock berthing, superstructure aft, starboard side. A picture of the latter is given in Fig. 7, and, following the plain directions just given, every reader of the WESTERN ELECTRICIAN who visits the ship should be able to find it without further inquiry. Each search-light takes 80 amperes of current at 80 volts pressure, and may be electrically controlled. In the base of each stand is a motor, and the controlling apparatus is placed in some protected part of the ship. In the case of the lamp shown in Fig. 7, however, the switchboard is just abaft the binnacle. The operator can, by means of switches, elevate or lower the projector, turn it to right or left, or it can be set to work automatically, sweeping the horizon in both directions at any arc the operator may desire. These search-lights are operated on every open evening, and attract much attention.

The ship is equipped with a complete set of Ardois electric signaling lanterns, the method of operating which has heretofore been described in this journal. There are five double lanterns (one being shown in Fig. 6), and they are operated by means of a key-board in the pilot-house. The lanterns are suspended by a double jack-stay on the port side of the military mast, extending downward from the upper fighting top at intervals of ten feet. Any ordinary message can be spelled out by the red and white lights.

In addition to the dynamo plant a battery of 100 storage cells, arranged in series of 25 each, is provided. The cells may be discharged in multiple with the generator, or, in case of accident, the lights can be supplied from the batteries alone. Two Sturtevant blowers operated by ¼ horse power General Electric motors are on exhibition in the dynamo and storage battery rooms, and a two horse power motor is used in the machine shop to drive lathes, planers, shapers, etc.

The electrical equipment of the vessel was furnished and installed by the General Electric company, and the work was done under the direction of F. H. Altekamp, foreman of construction in the marine department, and C. C. Mattison, electrical expert. These gentlemen are

always glad to explain the features of the plant to all visitors interested in electricity.

On the occasion of the first visit of the Princess Eulalia to the fair on Thursday of last week an especial effort was made to furnish an attractive electric display in the evening. Among other special features was the word "Eulalia" in letters of fire on the summit of the tower of light in electricity building. Everybody noticed it.

The Hardtmuth carbon exhibit in the electricity building, Fig. 8, is attracting considerable attention. Hardtmuth & Co., of Vienna, evidently appreciate the increasing demand for high-grade carbons in the United States, and have, in connection with their American representative, the International Thomson-Houston company, made a creditable exhibit. Both solid and cored carbons are shown, varying in diameter from 1-8 of an inch to 12 inches. It is said that Hardtmuth & Co. have the largest carbon manufacturing plant in the world, and that they

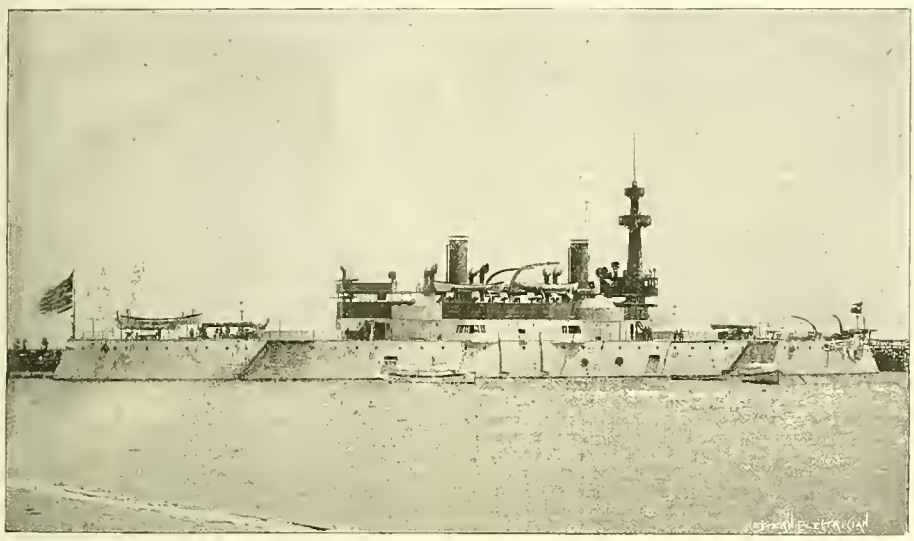

FIG. 2. ELECTRICITY AT THE WORLD'S FAIR —THE BATTLE-SHIP ILLINOIS.

control over two-thirds of the entire business in Europe. Moritz von Hardtmuth is looking after the interests of his company in Chicago. The World's Columbian Exposition has purchased 100,000 of these carbons for use in arc lamps running on incandescent and motor circuits.

Siemens & Halske's electric scenic theater on the Midway Plaisance was opened by a special afternoon performance on Friday of last week.

Two enterprising exhibitors in the northern end of the electricity building—the Elektron Manufacturing company and the Ansonia Electric company—are carrying their friends to the gallery in electric elevators, for which a great multitude rise up and call them blessed.

As in every other department of the exposition, the artistic taste of the French is shown in their exhibit in electricity building. An elaborate incandescent fixture shown by Lacarriere & Delatour of Paris is illustrated in Fig. 9. It is a metallic female figure of life size upholding a cluster of ten lamps in frosted glass globes. The lamps are from the establishment of Pulsford, Triquet & Co. of Paris. Those who are interested in beautiful fixtures of this character should not fail to visit the wonderful collection of bronzes in the French section of the manufactures building, where a number of exquisite designs are shown. The one illustrated, however, may be found in the northwestern bay of the electricity building, ground floor. The French electrical exhibit is in charge of G. De La Touanne, who is glad to explain its features to visitors.

An electric lighting plant is to be established at Montague, Mich.

Storage Battery Controversy at Hartford.

The special committee appointed by the city council of Hartford, Conn., to investigate the working of the storage battery system of street car propulsion as used by the Milford & Hopedale, Mass., Street Railway company, and report upon the advisability of its adoption in Hartford, has concluded its labors. Three reports are presented, one by Prof. Robb, of Trinity College, engaged as an electrical expert, which condemns the system; one by the majority of the committee, recommending its adoption for trial, but providing for the use of the trolley system if the former be found inefficient; and one by the minority, urging the adoption of the Milford system and none other. Prof. Robb's report is, of course, the only one of any scientific value, but he admits that its value is impaired by the refusal of the storage officials to allow him to make any efficiency tests of their batteries. In his report he says his opinion is based upon an inspection of the plant of the company at Milford and upon measurements made with Mr. Rogers, electrician of the Eddy Electric company, of the power required to run the car during the eleven mile run at the time of the committee's visit to Milford on May 1st. Prof. Robb continues:

An inspection of the Milford system shows that under the supervision of Messrs. Usher and Stevens, the Milford & Hopedale company has devised a system of storage battery traction that is in several important particulars a marked improvement upon previous similar systems; the car is under especially good control and runs with very little noise, and the changing of the storage battery from the car to the charging platform is quickly and easily accomplished.

The most important feature of the Milford system, however, is the storage cell invented by Mr. Usher. Unfortunately the officials of the Milford company were unwilling to furnish any of the Usher cells so that their efficiency and life under various conditions could be tested, and conclusions on those points must therefore be based entirely upon the statements of Messrs. Usher and Stevens of the Milford company, and upon statements contained in the affidavit of Prof. Trowbridge of Harvard University, in connection with a suit brought by the Brush Electric company against the Milford & Hopedale Street Railway company. From these statements it appears: First, that the Usher cell does not deteriorate to any marked degree when standing unused. The older forms of cells deteriorate rapidly when not in use. Second, that very much stronger currents can be discharged through the Usher cell than through others without permanently injuring the cells. In running the car on May 1st the current used was frequently greater than 130 amperes, although 20 amperes would have been considered the maximum current that could be sent through the cell of the same size of other types without injuring the cell. Third, that more energy can be stored in an Usher cell of a given size than in the other forms of storage cells. Consequently the Usher cell, assuming the reliability of the above statements, is especially adapted to street railway work. Notwithstanding these advantages of the Milford system over the other storage systems, and recognizing the great advantages of a storage battery system over a trolley system, in that it leaves the streets free from wires and the noise of the trolley, I am of the opinion that the Milford system would not give satisfactory service in the city of Hartford, and that no street railway company could be expected to adopt this system under existing conditions. It was represented to your committee that a car could be run by the storage battery system with less power than by the trolley. In fact that an equipment of two 7½ horse power motors was all that was necessary when the storage battery system was used. The observations made with Mr. Rogers on May 1st during an eleven mile run showed that the average horse power used was 19 6-10 horse power and at times the power used was greater than 50 horse power, the greatest power that can be recorded by the instruments at our disposal. The total power that can be obtained from a storage battery depends upon the rate at which the battery is discharged, and although in the case of the Usher cell it is claimed that the cell is not injured by a rapid rate of discharge, it is admitted that the total power obtained from a given charge diminishes rapidly as the rate of discharge or, what amounts to the same thing, the horse power used is increased. In other words, when power is taken from the storage battery at too rapid a rate, power is wasted; the loss of the power in the trolley system due to the electrical resistance of the wire and to leakage owing to imperfect insulation is inappreciable in comparison with the loss of power due to the low efficiency of a storage battery when the power is used at the rate necessary in running the cars of a street railway. In going up the heavy grades between Milford and Hopedale, the power required to run the car was greater than the greatest horse power that our instruments would measure; that is, greater than 50 horse power. This power was required on a day when it was not raining and with only nine passengers in the car and no stops were made on the grade. I would infer from this that with a loaded car and with the tracks wet and slippery, the power furnished by the battery on the car would be entirely insufficient at least to maintain rapid transit on the heavier grades of our city railway. To carry a larger battery would be impracticable. One of the chief claims of the Milford company is that the compactness and lightness of its battery equipment makes the system a practical one from a commercial standpoint.

Up to the present time the Milford system has been tried only upon a street railway where the cars are run at infrequent intervals, with light loads and under the direct supervision of the inventors of the system; before adopting the system it would be essential to have a thorough test made under local conditions of street railway service and with the entire equipment of the car, including the battery open to inspection.

The Brush Electric company holds a broad patent on storage cells where the active material is mechanically applied and it has brought suit for an injunction against the Milford & Hopedale Street Railway company, claiming that the Usher cell is an infringement of the Brush patent. Until this suit is settled no street railway would be likely to adopt the system, even if it were satisfactory in other respects.

The report of the majority of the committee is as follows:

We have, in connection with Prof. Robb and Mr. Rogers of the Eddy Electric company of Windsor, given the matter most careful consideration. We find that the practical workings of the system are apparently satisfactory. The road at Milford comprises about six and one-half miles of track, in course of which there were many grades and many sharp curves. The steepest grade was one of 10 per cent. This grade was ascended at the rate of six miles an hour. The greatest rate of speed shown was from 18 to 20 miles per hour, at which rate the car was stopped within 60 feet. A distance of two and one-half miles was covered in 11 minutes, and the same time was made on the return trip. The cars run very smoothly, with comparatively no jolting, and conversation while in transit can be easily heard. The road bed is constructed with comparatively light rails, and sleepers or ties six to eight feet apart. The car equipment consists of duplicate batteries containing 140 cells and two motors estimated at seven and one-half horse power each, the total weight of the car fully equipped being seven and one-half tons. The batteries are charged in the power house, and it was stated by Mr. Usher, the president of the system, that two and three-fourth hours' of charging was sufficient for a 35-mile run. These batteries are placed on a platform during the process of charging and from this are easily slid into the cars. They can be replaced in about two minutes. From a commercial standpoint we find, as compared with the trolley system:

First, that at the power house each system requires boilers, engines and dynamos, but that the amount of horse power required by the storage battery system is stated to be 50 per cent. less than that required by the trolley.

Second, that in the storage system the wires and poles are dispensed with, which is a great item of expense. For

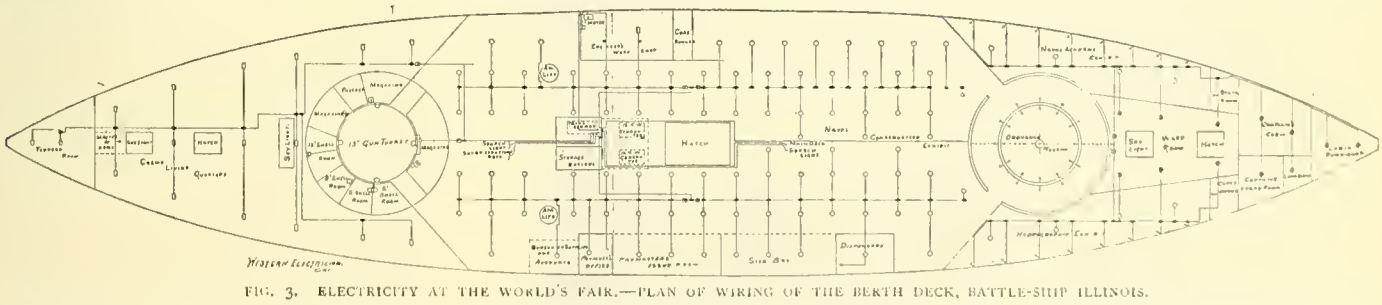

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.—PLAN OF WIRING OF THE BERTH DECK, BATTLE-SHIP ILLINOIS.

instance, in the Springfield system the cost for wiring and poling in round numbers was about $4,000 a mile. This amount includes feed wires.

Having now reached a point where the comparative expense of both systems is to be shown, we submit the following:

Hartford has about 30 miles of road in operation. Figuring for wiring and poling on the same basis used by the Springfield system, that is at the rate of $4,000 per mile, we have $120,000 for wiring and poling the entire road. It, as is claimed, the Hartford & Weathersfield Horse Railroad company runs 40 cars, the cost of equipping the same with duplicate sets of batteries at $2,200 per car would be $88,000, which would be $32,000 less than equipping the same line with the trolley system.

In comparing the two systems we have taken the city of Springfield, which is conceded by expert electricians to have one of the best constructed systems in the United States. Furthermore, our figures are more accurate than those that can be obtained from statistics as they come di-

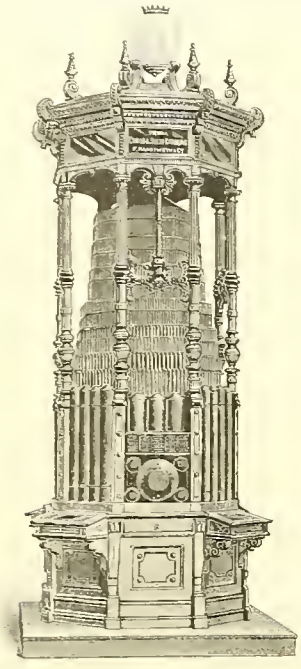

FIG. 8. ELECTRICITY AT THE WORLD'S FAIR.—HARDTMUTH'S CARBON EXHIBIT, ELECTRICITY BUILDING.

rectly from the management of each system. Now as to the cost of propulsion in the trolley system as compared with the maintenance of the storage system, we find that in the Springfield road the power is furnished by the Springfield Electric Light company at a cost of 3 cents a mile per car which it claims is less than in most cities and even cheaper than the management of the trolley road can furnish power itself, for the reason that it furnishes the power for lighting the city, and hence has surplus power at its disposal, which it can afford to sell at a very low rate. Admitting that this rate is low, it will be seen that the cost of power per car estimated at running 100 miles per day would be $3 per car. The maintenance of the storage system will be guaranteed at $800 per car per year or $2.19 per day. With such a guaranty it will be seen that the element of loss to the company for the deterioration of batteries is removed. It is conceded by electricians in general that the traction car of the future is the storage battery car.

Concerning the suit for alleged infringement of patents by the Brush Electric company, we are informed that the Milford & Hopedale company is willing to give bonds guaranteeing the Hartford road against any loss or losses from patent litigation. In view of the foregoing facts we feel justified in requesting and authorizing the Hartford & Weathersfield Horse Railroad company to equip one of its main lines with the Milford storage battery system.

Light and Other High Frequency Phenomena.

By Nikola Tesla.

PART III.

The first class of effects I intend to show you are effects produced by electrostatic force. It is the force which governs the motion of the atoms, which causes them to collide and develop the life sustaining energy of heat and light, and which causes them to aggregate in an infinite variety of ways, according to Nature's fanciful designs, and to form all these wondrous structures we perceive around us; it is, in fact, if our present views be true, the most important force for us to consider in Nature. As the term electrostatic might imply a steady electric condition, it should be remarked that in these experiments the force is not constant, but varies at a rate which may be considered moderate, about one million times a second, or thereabouts. This enables me to produce many effects which are not producible with an unvarying force.

When two conducting bodies are insulated and electrified, we say that an electrostatic force is acting between them. This force manifests itself in attractions, repulsions and stresses in the bodies and space or medium without. So great may be the strain exerted in the air, or whatever separates the two conducting bodies, that it may break down, and we observe sparks or bundles of light or streamers, as they are called. These streamers form abundantly when the force through the air is rapidly varying. I will illustrate this action of electrostatic force in a novel experiment in which I will employ the induction coil before referred to. The coil is contained in a trough filled with oil, and placed under the table. The two ends of the secondary wire pass through the two thick columns of hard rubber, which protrude to some height above the table. It is necessary to insulate the ends or terminals of the secondary heavily with hard rubber, because even dry wood is by far too poor an insulator for these currents of enormous potential differences. On one of the terminals of the coil I have placed a large sphere of sheet brass, which is connected to a larger insulated brass plate, in order to enable me to perform the experiments under conditions which, as you will see, are more suitable for this experiment. I now set the coil to work and approach the free terminal with a metallic object held in my hand, this simply to avoid burns. As I approach the metallic object to a distance of eight or ten inches, a torrent of furious sparks break forth from the end of the secondary wire, which passes through the rubber column. The sparks cease when the metal in my hand touches the wire. My arm is now traversed by a powerful electric current, vibrating at about the rate of one million times a second. All around me the electrostatic force makes itself felt, and the air molecules and particles of dust flying about are acted upon and are hammering violently against my body. So great is this agitation of the particles, that when the lights are turned out you may see streams of feeble light appear on some parts of my body. When such a streamer breaks out on any part of the body, it produces a sensation like the pricking of a needle. Were the potentials sufficiently high and the frequency of the vibration rather low, the skin would probably be ruptured under the tremendous strain, and the blood would rush out with great force in the form of fine spray or jet so thin as to be invisible, just as oil will when placed on the positive terminal of a Holtz machine. This breaking through of the skin, though it may seem impossible at first, would perhaps occur, by reason of the tissues under the skin being incomparably better conducting. This, at least, appears plausible, judging from some observations.

I can make these streams of light visible to all, by touching with the metallic object one of the terminals as before, and approaching my free hand to the brass sphere, which is connected to the second terminal of the coil. As the hand is approached the air between it and the sphere, or in the immediate neighborhood, is more violently agitated and you see streams of light now break forth from my finger tips and from the whole hand, Fig. 5. Were I to approach the hand closer, powerful sparks would jump from the brass sphere to my hand, which might be injurious. The streamers offer no particular inconvenience, except that in the ends of the finger tips a burning sensation is felt. They should not be confounded with those produced by an influence machine because in many respects they behave differently. I have attached the brass sphere and plate to one of the terminals in order to prevent the formation of visible streamers on that terminal, also in order to prevent sparks from jumping at a considerable distance. Besides, the attachment is favorable for the working of the coil.

The streams of light which you have observed issuing from my hand are due to a potential of about 200,000 volts, alternating in rather irregular intervals, something like a million times a second. A vibration of the same amplitude, but four times as fast, to maintain which over 3,000,000 volts would be required, would be more than sufficient to envelop my body in a complete sheet of flame. But this

FIG. 9. ELECTRICITY AT THE WORLD'S FAIR —FRENCH INCANDESCENT LIGHT FIXTURE, ELECTRICITY BUILDING.

flame would not burn me up; quite contrarily, the probability is that I would not be injured in the least. Yet a hundredth part of that energy, otherwise directed, would be amply sufficient to kill a person.

The amount of energy which may thus be passed into the body of a person depends on the frequency and potential of the currents, and by making both of these very great, a vast amount of energy may be passed into the body without causing any discomfort, except perhaps, in the arm which is traversed by a true conduction current. The reason why no pain in the body is felt and no injurious effect noted is that everywhere, if a current be imagined to flow through the body, the direction of its flow would be at right angles to the surface; hence the body of the experimenter offers an enormous section to the current, and the density is very small, with the exception of the arm perhaps, where the density may be considerable. But if only a small fraction of that energy would be applied in such a way that a current would traverse the body in the same manner as a low frequency current, a shock would be received which might be fatal. A direct or low frequency alternating current is fatal, I think, principally because its distribution through the body is not uniform, as it must divide itself in minute streamlets of great density, whereby some organs are vitally injured. That such a process occurs I have not the least doubt, though no evidence might apparently exist or be found upon examination. The surest to injure and destroy life is a continuous current, but the most painful is an alternating current of very low frequency. The expression of these views, which are the result of long continued experiment and observation, both with steady and varying currents, is elicited by the interest which is at present taken in this subject, and by the manifestly erroneous ideas which are daily propounded in journals on this subject.

I may illustrate an effect of the electrostatic force by another striking experiment, but before doing so I must call your attention to one or two facts. I have said that when the medium between two oppositely electrified bodies is strained beyond a certain limit it gives way and, stated in popular language, the opposite electric charges unite and neutralize each other. This breaking down of the medium occurs principally when the force acting between the bodies is steady, or varies at a moderate rate. Were the variation sufficiently rapid, such a destructive break would not occur, no matter how great the force, for all the energy would be spent in radiation, convection and

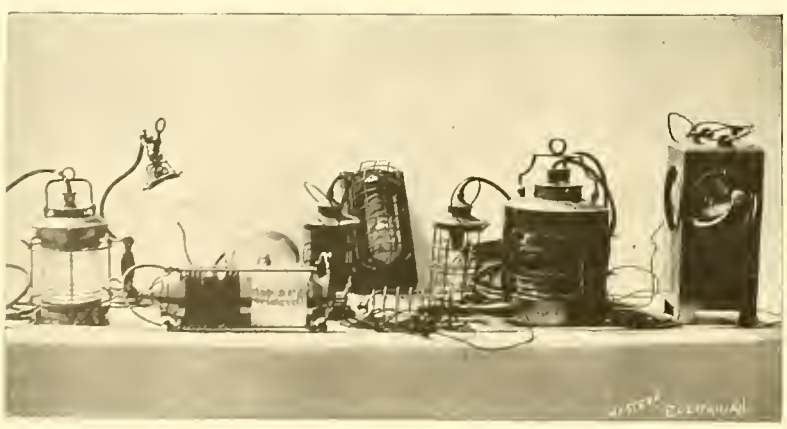

FIG. 6. ELECTRICITY AT THE WORLD'S FAIR.—SOME OF THE ELECTRICAL FIXTURES USED ON THE BATTLE-SHIP ILLINOIS.

mechanical and chemical action. Thus the spark length or greatest distance through which a spark will jump between the electrified bodies o is the smaller, the greater the variation or time rate of change. But this rule may be taken to be true only in a general way, when comparing rates which are widely different.

I will show you by an experiment the difference in the effect produced by a rapidly varying and a steady or moderately varying force. I have here two large circular brass plates $p\,p$, Fig. 6*a* and Fig. 6*b*, supported on movable insulating stands on the table, connected to the ends of the secondary of a similar coil as the one used before. I place the plates ten or twelve inches apart and set the coil to work. You see the whole space between the plates, nearly two cubic feet, filled with uniform light, Fig 6*a*. This light is due to the streamers you have seen in the first experiment, which are now much more intense. I have already pointed out the importance of these streamers in commercial apparatus and their still greater importance in some purely scientific investigations. Often they are too weak to be visible, but they always exist, consuming energy and modifying the action of the apparatus. When intense, as they are at present, they produce ozone in great quantity and also, as Professor Crookes has pointed out, nitrous acid. So quick is the chemical action, that if a coil, such as this one, is worked for a very long time it will make the atmosphere of a small room unbearable, for the eyes and throat are attacked. But when moderately produced, the streamers refresh the atmosphere wonderfully, like a thunder-storm, and exercise unquestionably a beneficial effect.

In this experiment the force acting between the plates changes in intensity and direction at a very rapid rate. I will now make the rate of change per unit time much smaller. This I effect by rendering the discharges through the primary of the induction coil less frequent, and also by diminishing the rapidity of the vibration in the secondary. The former result is conveniently secured by lowering the electromotive force over the air gap in the primary circuit, the latter by approaching the two brass plates to a distance of about three or four inches. When the coil is set to work you see no streamers or light between the plates, yet the medium between them is under a tremendous strain. I still further augment the strain by raising the electromotive force in the primary circuit, and soon you see the air give way and the hall is illuminated by a shower of brilliant and noisy sparks, 6*b*. These sparks could be produced also with unvarying force; they have been for many years a familiar phenomenon, though they were usually obtained from entirely different apparatus. In describing these two phenomena, so radically different in appearance, I have advisedly spoken of a "force" acting between the plates. It would be in accordance with accepted views to say that there was an "alternating electromotive force" acting between the plates. This term is quite proper and applicable in all cases where there is evidence of at least a possibility of an essential inter-dependence of the electric state of the plates or electric action in their neighborhood. But if the plates were removed to an infinite distance, or if at a finite distance, there is no probability or necessity whatever for such dependence. I prefer to use the term "electrostatic force," and to say that such a force is acting around each plate or electrified insulated body in general. There is an inconvenience in using this expression, as the term incidentally means a steady electric condition; but a proper nomenclature will eventually settle this difficulty.

I now return to the experiment to which I have already alluded, and with which I desire to illustrate a striking effect produced by a rapidly varying electrostatic force. I attach to the end of the wire, L, Fig. 7, which is in connection with one of the terminals of the secondary of the induction coil, an exhausted bulb b. This bulb contains a thin carbon filament F, which is fastened to a platinum wire w, sealed in the glass and leading outside of the bulb, where it connects to the wire L. The bulb may be exhausted to any degree attainable with ordinary apparatus. Just a moment before, you have witnessed the breaking down of the air between the charged brass plates. You know that a plate of glass, or any other insulating material would break down in like manner. Had I therefore a metallic coating attached to the outside of the bulb, or placed near the same, and were this coating connected to the other terminal of the coil, you would be prepared to see the glass give way if the strain were sufficiently increased. Even were the coating not connected to the other terminal, but to an insulated plate, still, if you have followed recent developments, you would naturally expect a rupture of the glass.

But it will certainly surprise you to note that under the action of the varying electrostatic force, the glass gives way when all other bodies are removed from the bulb. In fact, all the surrounding bodies we perceive might be removed to an infinite distance without affecting the result in the slightest. When the coil is set to work, the glass is invariably broken through at the seal, or other narrow channel, and the vacuum is quickly impaired. Such a damaging break would not occur with a steady force, even if the same were many times greater. The break is due to the agitation of the molecules of the gas within the bulb and outside of the same. This agitation, which is generally most violent in the narrow pointed channel near the seal, causes a heating and rupture of the glass. This rupture would, however, not occur, not even with a varying force, if the medium filling the inside of the bulb and that surrounding it were perfectly homogeneous. The break occurs much quicker if the top of the bulb is drawn out into a fine fiber. In bulbs used with these coils such narrow, pointed channels must therefore be avoided.

When a conducting body is immersed in air or similar insulating medium consisting of or containing small freely movable particles capable of being electrified, and when the electrification of the body is made to undergo a very rapid change—which is equivalent to saying that the electrostatic force acting around the body is varying in intensity—the small particles are attracted and repelled, and their violent impacts against the body may cause a mechanical motion of the latter. Phenomena of this kind are noteworthy, inasmuch as they have not been observed before with apparatus such as has been commonly in use. If a very light conducting sphere be suspended on an exceedingly fine wire, and charged to a steady potential, however high, the sphere will remain at rest. Even if the potential would be rapidly varying, provided that the small particles of matter, molecules or atoms, are evenly distributed, no motion of the sphere should result. But if one side of the conducting sphere is covered with a thick insulating layer, the impacts of the particles will cause the sphere to move about, generally in irregular curves, Fig. 8*a*. In like manner, as I have shown on a previous occasion, a fan of metal sheet, Fig. 8*b*, covered partially with insulating material, as indicated, and placed upon the terminal of the coil so as to turn freely in it, is spun around.

All these phenomena you have witnessed and others which will be shown later are due to the presence of a medium like air, and would not occur in a continuous medium. The action of the air may be illustrated still better by the following experiment. I take a glass tube t, Fig. 9 of about an inch in diameter, which has a platinum wire w sealed in the lower end, and to which is attached a thin lamp filament f. I connect the wire with the terminal of the coil and set the coil to work. The platinum wire is now electrified positively and negatively in rapid succession, and the wire and air inside of the tube are rapidly heated by the impacts of the particles, which may be so violent as to render the filament incandescent. But if I pour oil in the tube, just as soon as the wire is covered with the oil, all action apparently ceases, and there is no marked evidence of heating. The reason of this is that the oil is a practically continuous medium. The displacements in such a continuous medium are, with these frequencies, to all appearance incomparably smaller than in air; hence the work performed in such a medium is insignificant. But oil would behave very differently with frequencies many times as great, for even though the displacements be small, if the frequency were much greater, considerable work might be performed in the oil.

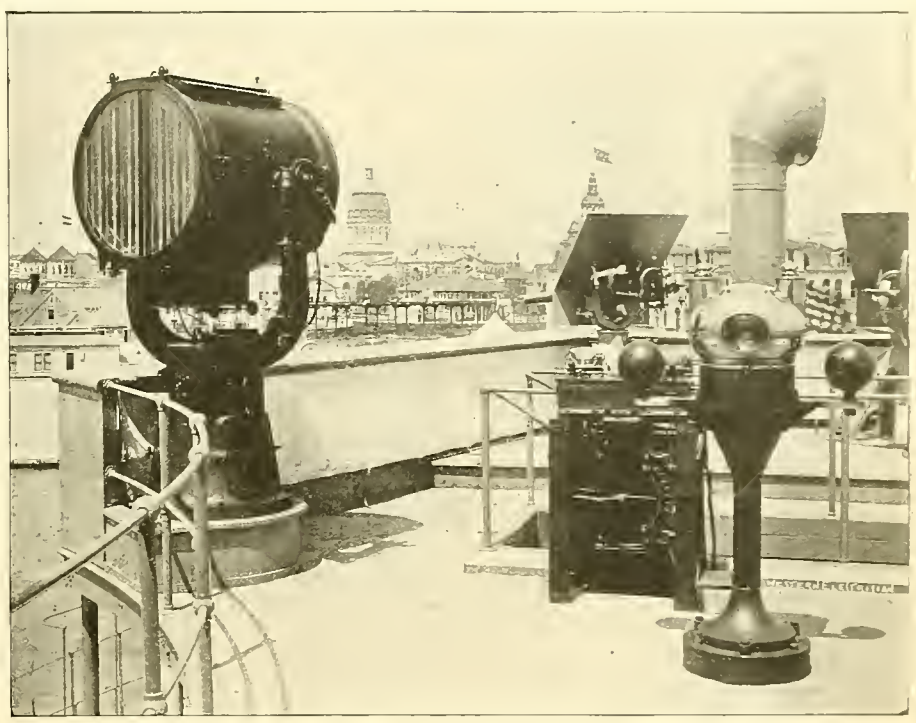

FIG. 7 ELECTRICITY AT THE WORLD'S FAIR.—SEARCH-LIGHT ON THE BATTLE-SHIP ILLINOIS.

The electrostatic attractions and repulsions between bodies of measurable dimensions are, of all the manifestations of this force, the first so-called electrical phenomena noted. But though they have been known to us for many centuries, the precise nature of the mechanism concerned in these actions is still unknown to us, and has not been even quite satisfactorily explained. What kind of mechanism must that be? We cannot help wondering when we observe two magnets attracting and repelling each other with a force of hundreds of pounds with apparently nothing between them. We have in our commercial dynamos magnets capable of sustaining in mid-air tons of weight. But what are even these forces acting between magnets when compared with the tremendous attractions and repulsions produced by electrostatic force, to which there is apparently no limit as to intensity. In lightning discharges bodies are often charged to so high a potential that they are thrown away with inconceivable force and torn asunder or shattered into fragments. Still even such effects cannot compare with the attractions and repulsions which exist between charged molecules or atoms, and which are sufficient to project them with speeds of many kilometers a second so that under their violent impact bodies are rendered highly incandescent and are volatilized. It is of special interest for the thinker who inquires into the nature of these forces to note that whereas the actions between individual molecules or atoms occur seemingly under any condition, bearing upon the preceding remarks, namely, when the filament had been kept incandescent some time the narrow tube and the space inside was brought to an elevated temperature, and as the gas in the tube then became conducting the electrostatic attraction between the glass and the filament became very weak or ceased, and the filament came to rest. When it came to rest it would glow far more intensely. This was probably due to its assuming the position in the center of the tube where the molecular bombardment was most intense, and also partly to the fact that the individual impacts were more violent and that no part of the supplied energy was converted into mechanical movement. Since, in accordance with accepted views, in this experiment the incandescence must be attributed to the impacts of the particles, molecules or atoms in the heated space, these particles must, therefore, in order to explain such action, be assumed to behave as independent carriers of electric charges immersed in an insulating medium, yet there is no attractive force between the glass tube and the filament because the space in the tube is, as a whole, conducting.

It is of some interest to observe in this connection that whereas the attraction between two electrified bodies may cease, owing to the impairing of the insulating power of the medium in which they are immersed, the repulsion between the bodies may still be observed. This may be explained in a plausible way. When the bodies are placed at some distance in a poorly conducting medium, such as slightly warmed or rarefied air, and are suddenly electrified, opposite electric charges being imparted to them, these charges equalize more or less by leakage through the air. But if the bodies are similarly electrified, there is less opportunity afforded for such dissipation, hence the repulsion observed in such case is greater than the attraction. Repulsive actions in a gaseous medium are, however, as Prof. Crookes has shown, enhanced by molecular bombardment.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

SOMETHING must be the matter with the liver of the editor of our able contemporary, the London *Electrician*, for he certainly views the World's Fair with a jaundiced eye. He alludes to it as "an archipelago of packing cases encircled in a sea of mud" and is quite disgusted with the fuss made over it and the superlative ecstacies indulged in by some of our American writers in their vain endeavors to write up to the height of the occasion". We must admit that criticism of some of the grandiose, adjective-studded descriptions of the World's Fair that have been published is well deserved on the score of good taste, although the extent and magnificence of the exposition are such that it is not strange that many writers become somewhat giddy in attempting to reach the heights to which our contemporary refers. But to employ the "packing-case and mud" metaphor is going to the other extreme, and can best be accounted for as the effect of a disordered digestion. A radical cure could be wrought by a sea voyage and a land journey to Chicago, and this we hope to see accomplished, but in the meantime the weekly treatment afforded by the columns of the WESTERN ELECTRICIAN may be accepted as an excellent substitute and palliative.

TWO accidents have occurred in Chicago since the introduction of the overhead trolley on the cross-town lines of the South Side, but neither of these was directly attributable to the fact that electric power was used. As a matter of fact it is to be expected that until the people grow accustomed to the new swift-going cars that have replaced the slow-going horse cars, there will be increased danger of accidents. But the same would be true of any other form of power used. Rapid transit cannot be had except by the utilization of modern methods of propulsion and all of these involve increased danger to life and limb. Certain it is that with these improvements the companies should exercise greater care in the selection of employes in whose charge the cars are placed and they should not be put on duty until they have been thoroughly instructed in the handling of the apparatus. There is much responsibility on the company and its employes and there are corresponding obligations resting on the public. Generally speaking the accidents on electric railways are caused by negligence or ignorance on the part of the victims, but the public is not discriminating and it does not always give corporations credit for what they have done. A little patience on the part of the public and the exercise of reasonable precaution by the company will avert accidents and promote good feeling.

SO MUCH has been said about the success of the Milford and Hopedale storage battery railway in Massachusetts that the official reports of Hartford citizens appointed to investigate the system, which are presented on another page, will be read with great interest. A local street car company in the Connecticut capital proposes to abandon horses and employ electricity as a motive power, and before the desired corporate permission was given a committee of citizens was appointed to carefully examine the practical working of the storage battery line at Milford, with the idea of securing the best possible system for the city before making the final decision. Prof. Robb of Trinity College was secured to accompany the committee in the capacity of an electrical expert.

The citizens have now made their reports, and it is not surprising that a considerable diversity of opinion exists. All the gentlemen were disinterested, and all entered upon the investigation with the hope that they could conscientiously report in favor of the storage battery as a practical, commercial factor in street railway work. Nevertheless, the only one of the party trained in the study of electrical problems felt compelled to report adversely on the system, the majority of the committee recommended the new system in guarded terms, but insisted that the Hartford company should also equip its line for the trolley system to be prepared for a failure of the batteries, while only a minority of the committee declared unreservedly in favor of the employment of accumulators.

On the whole, the result of the investigation made for the benefit of Hartford must be regarded as unfavorable to the storage battery system despite the rose-colored reports of the achievements at Milford, which have from time to time been published in the daily press. The opinion of Prof. Robb will carry much weight, especially in view of the fact that the management of the Milford and Hopedale company denied him the privilege of making a careful series of tests of the storage cell employed, for the purpose of determining its efficiency and durability. This refusal on the part of the company will certainly be taken as an admission of weakness by the general public. The professor also doubts whether it is practicable to carry enough energy on a car to propel it, heavily loaded, up a stiff grade in rainy or winter weather—conditions which, of course, must be anticipated. He also wisely points out the present condition of the litigation over storage battery patents, and warns the public of the danger of interference on this score. Many of the members of the committee seem greatly taken by the smaller initial cost of the storage battery system by reason of the absence of poles and wires. Insufficient attention, however, appears to have been paid to the comparative charges for maintenance and renewals of the two systems, and the fact that the earning power of the trolley roads is greatly increased by the ability to attach trailers to the motor cars, which does not seem to be possible with storage battery propulsion, appears to have been entirely lost sight of. The figures presented in the report are far from convincing us that the storage battery system is the more economical of the two, when relative earning power is taken into consideration.

Everybody would hail the introduction of a practical, every-day, rough-and-ready storage battery system for the propulsion of street cars with joy. How delightful to spin along in rapid-going cars actuated by a hidden source of energy, self-contained, with no smoke or cinders, laboring animals or landscape-disfiguring poles and wires! Rapid transit would then become ideal, and the New York newspaper men would be forced to abandon their "deadly trolley" cry and seek some other bugaboo to alarm the public. It is a pleasing prospect, but we fear that we have advanced but little toward it as the result of the first disinterested public investigation of the line at Milford.

GOVERNOR FLOWER'S plan for equipping the Erie canal with an overhead trolley system is attracting as much attention among capitalists and engineers as the men directly interested in the great waterway through the Empire State. It is evident that the governor has given the subject much thought. He has secured the opinions of experienced engineers on the feasibility of the project. In a recent interview he said he had procured estimates of the cost of such an equipment, and he felt sure that it would be covered by $1 000,000. This, he says, would provide for twelve power houses thirty miles apart. He believes that there are ample water powers along the canal to operate the plants, and that current could be supplied cheaply to the boatmen, thus greatly improving the system. Better time could be made by the boats, and this fact alone would, in his opinion, warrant the expenditure of a large sum of money. At the present time the state is called upon to expend over half a million dollars annually in keeping the towpath in repair. The introduction of the trolley system would remove the necessity for this expenditure, and the money could be used for deepening the channel and strengthening the banks to provide against washouts.

At the present time the only serious objection that can be raised to the adoption of the trolley system is the fact that there is not a uniform depth throughout the entire course, and that there is not in some parts of the canal enough water to allow the use of propellors. This, however, could be easily remedied, and the advantages, it would seem, would justify the Legislature in making the necessary appropriation. In this connection Governor Flower calls attention to the fact that Canada is spending $50,000,000 in improving the Welland canal and the St. Lawrence, in order to get a sufficient depth of water to allow of the establishing of a line of steamboats between Chicago, Duluth and Montreal. These steamers will each have a carrying capacity of over 2,000 tons, and could carry grain at five cents a bushel. This leads the governor to remark that "if New York is not to lose her supremacy as a port the national government should deepen the Buffalo harbor to twenty feet. This would enable vessels to come down the lakes to Buffalo, carrying a thousand more tons of grain than the Canadians propose to do with their steamers. If something of this sort is not done, and if we do not increase the speed of our canal boats, the great bulk of the western grain trade will go to the St. Lawrence. The canal has made the Empire State, and the people should not be slow in recognizing that fact and in bending every nerve toward increasing its efficiency."

While it is quite probable that the state will be called upon to make the necessary appropriation, there is no reason why private capital should not be used for this purpose if the Legislature refuses to undertake the work. In fact there are many reasons why it would be better to enlist private capital. In the first place the work would probably be conducted much more expeditiously and economically if removed from political influences. This fact is recognized by Governor Flower, who is quoted as saying: "If it does not seem best for the state to appropriate any such large sum of money as $1,000,000 for the purpose of equipping the Erie canal with an electric system, it strikes me that it would be an excellent opportunity for some private corporation, for not only could such a corporation furnish power for canal transportation, but it could as well do the lighting for the many little towns and cities along the route of the canal. It seems to me as a business man that this is an excellent opportunity for somebody to make some money."

It is a matter of congratulation that so much interest is manifested in this subject by Governor Flower, and it is to be hoped that the investigation instituted under his direction will result in the development of a practicable system of improved canal propulsion. It is certainly an important project, and if brought to a successful completion will be one of the most noteworthy accomplishments of the present administration

Light and other High Frequency Phenomena.

(*Continued from page* 313).

So far, I have considered principally effects produced by a varying electrostatic force in an insulating medium, such as air. When such a force is acting upon a conducting body of measurable dimensions, it causes within the same, or on its surface, displacements of the electricity and gives rise to electric currents, and these produce another kind of phenomena, some of which I shall presently endeavor to illustrate. In presenting this second class of electrical effects, I will avail myself principally of such as are producible without any return circuit, hoping to interest you

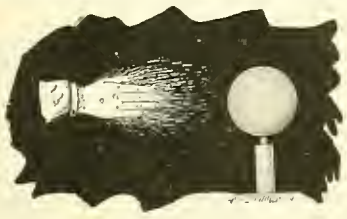

FIG. 5. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA. —EFFECT OF VARYING ELECTROSTATIC FORCE WITH A TRANSFORMER OF 200,000 VOLTS PRESSURE.

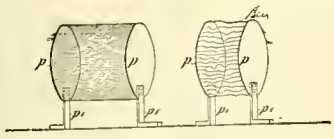
the more by presenting these phenomena in a more or less novel aspect.

It has been for a long time customary, owing to the limited experience with vibratory currents, to consider an electric current as something circulating in a closed conducting path. It was astonishing at first to realize that a current may flow through the conducting path even if the latter be interrupted, and it was still more surprising to learn, that sometimes it may be even easier to make a current flow under such conditions than through a closed path. But that old idea is gradually disappearing, even among practical men, and will soon be entirely forgotten.

If I connect an insulated metal plate P, Fig. 11, to one of the terminals T of the induction coil by means of a wire, though this plate be very well insulated, a current passes through the wire when the coil is set to work. First I wish to give you evidence that there is a current passing through the connecting wire. An obvious way of demonstrating this is to insert between the terminal of the coil and the insulated plate a very thin platinum or german silver wire w and



FIGS. 6*a* AND 6*b*. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—EFFECTS OF RAPIDLY VARYING AND STEADY ELECTROSTATIC FORCE.

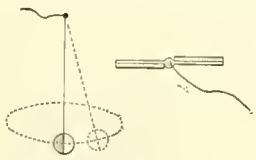
bring the latter to incandescence or fusion by the current. This requires a rather large plate or else current impulses of very high potential and frequency. Another way is to take a coil C, Fig. 11, containing many turns of thin insulated wire and to insert the same in the path of the current to the plate. When I connect one of the ends of the coil to the wire leading to another insulated plate P, and its other end to the terminal T, of the induction coil, and set the latter to work, a current passes through the inserted coil c and the existence of the current may be made manifest in various ways For instance, I insert an iron core i within the coil. The current being one of very high frequency, if it be of some strength, will soon bring the iron core to a noticeably higher temperature, as the hysteresis and current losses are great with such high frequencies. One might take a core of some size, laminated or not, it would matter little; but ordinary iron wire 1-16 or 1-8 of an inch thick is suitable for the purpose. While the induction coil is working a current traverses the inserted coil and only a few moments are sufficient to bring the iron wire i to an elevated temperature sufficient to soften the sealing-wax s, and cause a paper washer p fastened by it

FIG. 7. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA. —BREAKING A BULB ON OPEN CIRCUIT.

to the iron wire to fall off. But with the apparatus such as I have here, other, much more interesting, demonstrations of this kind can be made. I have a secondary S, Fig. 12, of coarse wire, wound upon a coil similar to the first. In the preceding experiment the current through the coil c, Fig. 11, was very small, but there being many turns a strong heating effect was, nevertheless, produced in the iron wire. Had I passed that current through a conductor in order to show the heating of the latter, the current might have been too small to produce the effect desired. But with this coil provided with a secondary winding, I can now transform the feeble current of high tension which passes through the primary P into a strong secondary current of low tension, and this current will quite certainly do what I expect. In a small glass tube (t, Fig. 12) I have enclosed a coiled platinum wire, w, this merely in order to protect the wire. On each end of the glass tube is sealed a terminal of stout wire to which one of the ends of the platinum wire w, is connected. I join the terminals of the secondary coil to these terminals and insert the primary p, between the insulated plate P_1 and the terminal T_1 of the induction coil as before. The latter being set to work, instantly the platinum wire w is rendered incandescent and can be fused even if it be very thick.

Instead of the platinum wire I now take an ordinary 50-volt 16 candle power lamp. When I set the induction coil in operation the lamp filament is brought to high incandescence. It is, however, not necessary to use the insulated plate, for the lamp l, Fig. 13, is rendered incandescent even if the plate P_1 be disconnected. The secondary may also be connected to the primary as indicated by the dotted line in Fig. 13, to do away, more or less, with the electrostatic induction or to modify the action otherwise.

I may here call attention to a number of interesting observations with the lamp. First, I disconnect one of the terminals of the lamp from the secondary S When the induction coil plays, a glow is noted which fills the whole bulb. This glow is due to electrostatic induction. It in-



FIGS. 8*a* AND 8*b*. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—MECHANICAL MOTIONS PRODUCED BY VARYING ELECTROSTATIC FORCE IN A GASEOUS MEDIUM.

creases when the bulb is grasped with the hand, and the capacity of the experimenter's body thus added to the secondary circuit. The secondary, in effect, is equivalent to a metallic coating, which would be placed near the primary. If the secondary or its equivalent, the coating, were placed symmetrically to the primary, the electrostatic induction would be nil under ordinary conditions—that is, when a primary return circuit is used, as both halves would neutralize each other. The secondary is, in fact, placed symmetrically to the primary, but the action of both halves of the latter, when only one of its ends is connected to the induction coil, is not exactly equal; hence electrostatic induction takes place, and hence the glow in the bulb. I can nearly equalize the action of both halves of the primary by connecting the other, free end of the same to the insulated plate, as in the preceding experiment. When the plate is connected the glow disappears. With a smaller plate it would not entirely disappear, and then it would contribute to the brightness of the filament

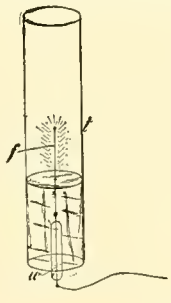


FIG. 9. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA. —SHOWING THE EFFECT OF THE AIR.

when the secondary is closed, by warming the air in the bulb.

To demonstrate another interesting feature, I have adjusted the coils used in a certain way. I first connect both the terminals of the lamp to the secondary, one end of the primary being connected to the terminal T_1 of the introduction coil and the other to the insulated plate P_1 as before. When the current is turned on, the lamp glows brightly, as shown in Fig. 14*b*, in which C is a fine wire coil and S a coarse wire secondary wound upon it. If the insulated plate P_1 is disconnected, leaving one of the ends a of the primary insulated, the filament becomes dark or generally it diminishes in brightness, Fig. 14*a*. Connecting again the plate P_1 and raising the frequency of the current I make the filament quite dark or barely red, Fig. 15*b*. Once more I will disconnect the plate. One will of course infer that when the plate is disconnected, the current through the primary will be weakened, that therefore the electromotive force will fall in the secondary S, and that the brightness of the lamp will diminish. This might be the case and the result can be secured by an easy adjustment of the coils; also by varying the frequency and potential of the currents. But it is perhaps of greater interest to note that the lamp increases in brightness when the plate is disconnected, Fig. 15*a*. In this case all the energy the primary receives is now sunk into it, like the charge of a battery in an ocean cable, but most of that energy is recovered through the secondary and used to light the lamp. The current traversing the primary is strongest at the end b, which is connected to the terminal T_1 of the induction coil, and diminishes in strength towards the remote end a. But the dynamic inductive effect exerted upon the secondary S is now greater than before when the suspended plate was connected to the primary. These results might have been produced by a number of causes. For instance, the plate P_1 being connected, the reaction from the coil C may be such as to diminish the potential at the terminal T_1 of the induction coil, and therefore weaken the current through

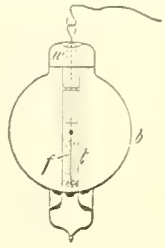

FIG. 10. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—SHOWING THE INFLUENCE OF THE CONDUCTIVITY OF THE MEDIUM UPON ELECTROSTATIC ACTIONS THROUGH MEASURABLE DISTANCE.

the primary of the coil C. Or the disconnecting of the plate may diminish the capacity effect with relation to the primary of the latter coil to such an extent that the current through it is diminished, though the potential at the terminal T_1 of the induction coil may be the same or even higher. Or the result might have been produced by the change of phase of the primary and secondary currents and consequent reaction. But the chief determining factor is the relation of the self-induction and capacity of coil C and plate P_1 and the frequency of the currents. The greater brightness of the filament in Fig. 15*a* is, however, in part due to the heating of the rarefied gas in the lamp by electrostatic induction, which, as before remarked, is greater when the suspended plate is disconnected.

Still another feature of some interest I may bring to your attention. When the insulated plate is disconnected and the secondary of the coil opened, by approaching a small object to the secondary, but very small sparks can be drawn from it, showing that the electrostatic induction

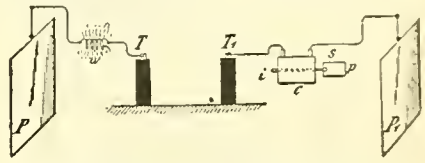

FIG. 11. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA —SHOWING EFFECTS OF CURRENTS FLOWING THROUGH OPEN CIRCUITS.

is small in this case. But upon the secondary being closed upon itself or through the lamp, the filament glowing brightly, strong sparks are obtained from the secondary. The electrostatic induction is now much greater, because the closed secondary determines a greater flow of current through the primary and principally through that half of it which is connected to the induction coil. If now the bulb be grasped with the hand, the capacity of the secondary with reference to the primary is augmented by the experimenter's body and the luminosity of the filament is increased, the incandescence now being due partly to the flow of current through the filament and partly to the molecular bombardment of the rarefied gas in the bulb.

The preceding experiments will have prepared one for the next following results of interest, obtained in the course of these investigations. Since I can pass a current through an insulated wire, merely by connecting one of its ends to the source of electrical energy; since I can induce by it another current, magnetize an iron core, and in short, perform all operations, as though a return circuit were used, clearly I can also drive a motor by the aid of only one wire. On a former occasion I have described a simple form of motor comprising a single exciting coil, an iron core and disc. Fig. 16 illustrates a modified way of operating such an alternate current motor by currents induced in a transformer connected to one lead, and several other

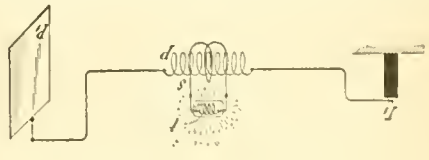

FIG. 12. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—CONVERSION ON OPEN CIRCUIT WITH COIL AND INSULATED PLATE.

arrangements of circuits for operating a certain class of alternate motors founded on the action of currents of different phase. In view of the present state of the art it is thought sufficient to describe these arrangements in a few words only. In the diagram, Fig. 16 II., shows a primary coil P, connected with one of its ends to the line L leading from a high tension transformer terminal T_2. In inductive relation to this primary P is a secondary S of coarse wire in the circuit of which is a coil c. The currents induced in the secondary energize the iron core i, which is preferably, but not necessarily, subdivided, and set the metal disc d in rotation. Such a motor M_2, as dia-

grammatically shown in Fig. 16 II., has been called a "magnetic lag motor," but this expression may be objected to by those who attribute the rotation of the disc to eddy currents circulating in minute paths when the core i is finally subdivided. In order to operate such a motor effectively on the plan indicated, the frequencies should not be too high, nor more than four or five thousand, though the rotation is produced even with ten thousand per second or more.

In Fig. 16 I a motor M_1, having two energizing circuits, A and B, is diagrammatically indicated. The circuit A is connected to the line L, and in series with it is a primary P, which may have its free end connected to an insu-

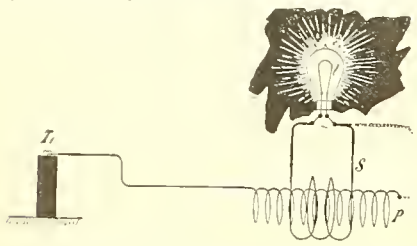

FIG. 13. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—CONVERSION ON OPEN CIRCUIT WITH COIL ALONE.

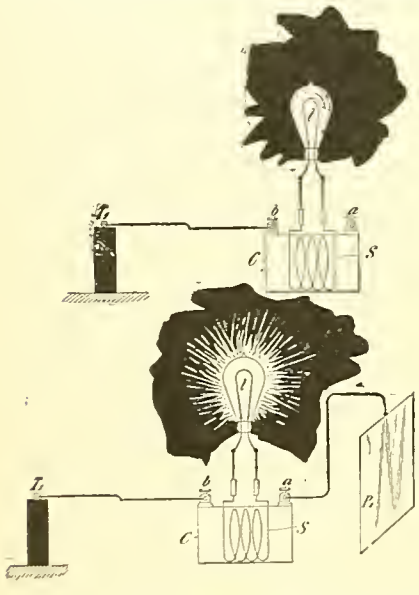
lated plate P_1, such connection being indicated by the dotted lines. The other motor circuit B is connected to the secondary S, which is in inductive relation to the primary P. When the transformer terminal T_1 is alternately electrified, currents traverse the open line L and also circuit A and primary P. The currents through the latter induce secondary currents in the circuit S, which pass through the energizing coil B of the motor. The currents through the secondary S and those through the primary P differ in phase 90 degrees, or nearly so, and are capable of rotating an armature placed in inductive relation to the circuits A and B.

In Fig. 16 III., a similar motor M_3 with two energizing circuits A_1 and B_1, is illustrated. A primary P, connected



FIGS. 14a AND 14b. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—EFFECT OF ATTACHED PLATE WITH LOW FREQUENCIES.

with one of its ends to the line L has a secondary S, which is preferably wound for a tolerably high electromotive force, and to which the two energizing circuits of the motor are connected, one directly to the ends of the secondary and the other through a condenser C, by the action of which the currents traversing the circuit A_1 and B_1 are made to differ in phase.

In Fig. 16 IV. still another arrangement is shown. In this case two primaries P_1 and P_2 are connected to the line L, one through a condenser C of small capacity, and the other directly. The primaries are provided with secondaries S_1 and S_2, which are in series with the energizing

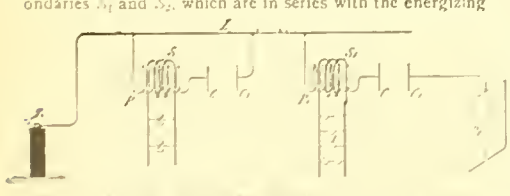


FIG. 17. [illegible] EFFECT OF PHENOMENA — [illegible] REGULATING THE EFFECT.

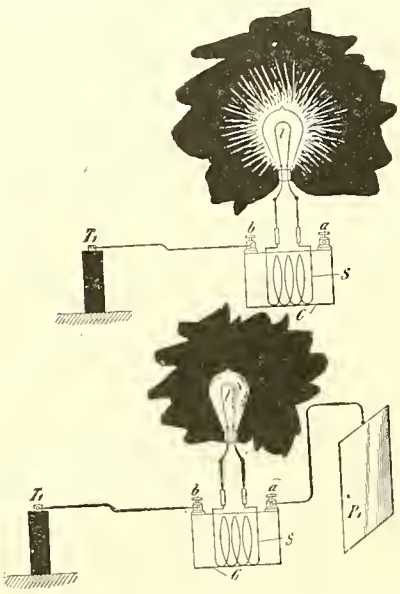
circuits A_1 and B_1 and a motor M_1, the condenser C again serving to produce the requisite difference in the phase of the currents traversing the motor circuits. As such phase motors with two or more circuits are now well known in the art, they have been here illustrated diagrammatically. No difficulty whatever is found in operating a motor in the manner indicated or in similar ways, and although such experiments up to this day present only scientific interest, they may at a period not far distant be carried out with practical objects in view.

It is thought useful to devote here a few remarks to the subject of operating devices of all kinds by means of only one leading wire. It is quite obvious that when high frequency currents are made use of ground connections are—at least when the electromotive force of the current is great—better than a return wire. Such ground connections are objectionable with steady or low frequency currents on account of destructive chemical actions of the former and disturbing influences exerted by both on the neighboring circuits; but with high frequencies these actions practically do not exist. Still, even ground connections become superfluous when the electromotive force is very high, for soon a condition is reached when the current may be passed more economically through open than through closed conductors. Remote as might seem an industrial application of such single wire transmission of energy to one not experienced in such lines of experiment, it will not seem so to anyone who for some time has carried on inves-



FIGS. 15a AND 15b. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—EFFECT OF ATTACHED PLATE WITH HIGH FREQUENCIES.

tigations of such nature. Indeed I cannot see why such a plan should not be practicable. Nor should it be thought that for carrying at such a plan currents of very high frequency are implicitly required, for just as soon as potentials of say 30,000 volts are used the single wire transmission may be effected with low frequencies, and experiments have been made by me from which these inferences are made.

When the frequencies are very high it has been found in laboratory practice quite easy to regulate the effects in the manner shown in diagram, Fig. 17. Here two primaries P and P are shown, each connected with one of its ends to the line L and with the other end to the condenser plates C and C^1, respectively. Near these are placed other condenser plates C^1 and C^1_1, the former being connected to the line L and the latter to an insulated larger plate P^2. On the primaries are wound secondaries S and S^1 of coarse wire, connected to the devices M and D respectively. By

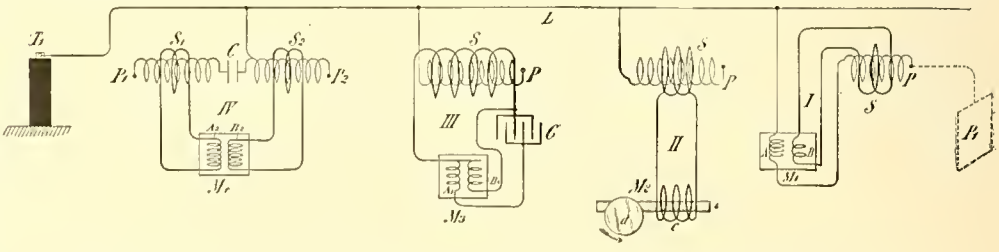


FIG. 16. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—WAYS OF OPERATING MOTORS WITH ONLY ONE LEAD.

varying the distances of the condenser plates C and C^1, and C_1 and C^1_1, the currents through the secondaries S and S_1 are varied in intensity. The curious feature is the great sensitiveness, the slightest change in the distance of the plates producing considerable variations in the intensity or strength of the currents. The sensitiveness may be rendered extreme by making the frequency such that the primary itself, without any plate attached to its free end satisfies, in conjunction with the closed secondary, the condition of resonance. In such condition an extremely small change in the capacity of the free terminal produces great variations. For instance, I have been able to adjust the conditions so that the mere approach of a person to the coil produces a considerable change in the brightness of the lamps attached to the secondary. Such observations and experiments possess, of course, at present, chiefly scientific interest, but they may soon become of practical importance.

Very high frequencies are of course not practicable with motors on account of the necessity of employing iron cores. But one may use sudden discharges of low frequency and thus obtain certain advantages of high-frequency currents without rendering the iron core entirely incapable of following the changes and without entailing a very great expenditure of energy in the core. I have found it quite practicable to operate with such low frequency disruptive discharges of condensers alternating current motors. A certain class of such motors which I advanced a few years ago, which contain closed secondary circuits, will rotate quite vigorously when the discharges are directed through the exciting coils. One reason that such a motor operates so well with these discharges is that the difference of phase between the primary and secondary currents is 90 degrees,

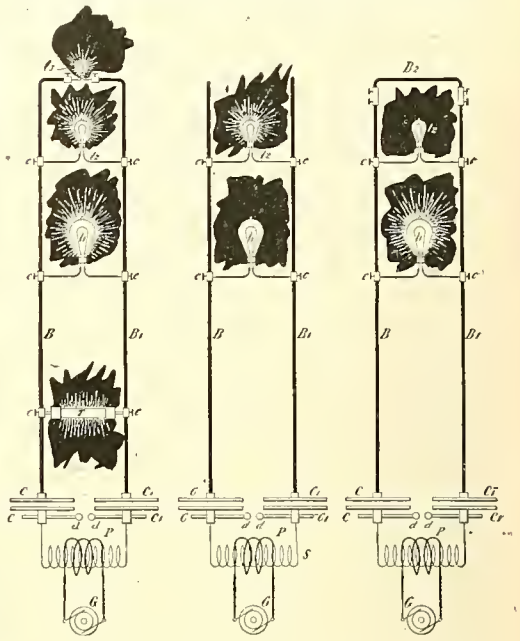

FIG. 19a, 19b, AND 19c. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—IMPEDANCE PHENOMENA.

which is generally not the case with harmonically rising and falling currents of low frequency. It might not be without interest to show an experiment with a simple motor of this kind, inasmuch as it is commonly thought that disruptive discharges are unsuitable for such purposes. The motor is illustrated in Fig. 18. It comprises a rather large iron core I with slots on the top into which are

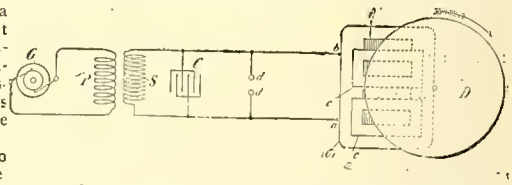

FIG. 18. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—OPERATING A MOTOR BY DISRUPTIVE DISCHARGES.

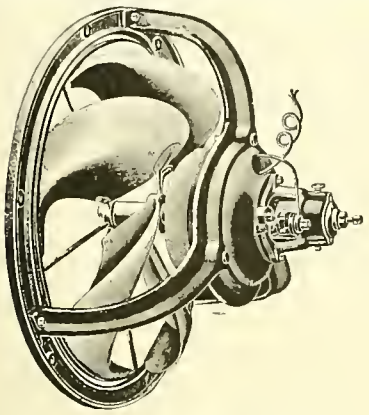
embedded thick copper washers C C. In proximity to the core is a freely-movable metal disc D. The core is provided with a primary exciting coil C, the ends A and B of which are connected to the terminals of the secondary S of an ordinary transformer, the primary P of the latter being

connected to an alternating distribution circuit or generator G of low or moderate frequency. The terminals of the secondary S are attached to a condenser C which discharges through an air gap D D which may be placed in series or shunt to the coil C. When the conditions are properly chosen the disc D rotates with considerable effort and the iron core I does not get very perceptibly hot. With currents from a high-frequency alternator, on the contrary, the core gets rapidly hot and the disc rotates with a much smaller effort. To perform the experiment properly it should be first ascertained that the disc D is not set in rotation when the discharge is not occurring at D D. It is preferable to use a large iron core and a condenser of large capacity so as to bring the superimposed quicker oscillation to a very low pitch or to do away with it entirely. By observing certain elementary rules I have also found it practicable to operate ordinary series or shunt direct current motors with such disruptive discharges, and this can be done with or without a return wire.

Among the various current phenomena observed perhaps the most interesting are those of impedance presented by conductors to currents varying at a rapid rate. In my first

paper before the American Institute of Electrical Engineers I described a few striking observations of this kind. Thus I showed that when such currents or sudden discharges are passed through a thick metal bar there may be points at the bar only a few inches apart, which have a sufficient potential difference between them to maintain at bright incandescence an ordinary filament lamp. I have also described the curious behavior of rarefied gas surrounding a conductor to such sudden rushes of current. These phenomena have been since more carefully studied and one or two novel experiments of this kind are deemed of sufficient interest to be described here.

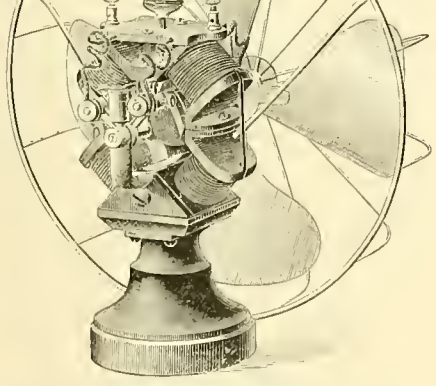
With reference to Fig 19 A, B and B_1, are very stout copper bars, connected at their lower ends to plates C and C_1, respectively, of a condenser, the opposite plates of the latter being



LUNDELL EXHAUST FAN OUTFIT.

connected to the terminals of the secondary S of a high tension transformer, the primary P of which is supplied with alternating currents from an ordinary low frequency dynamo G or distribution circuit. The condenser discharges through an adjustable gap D D as usual. By establishing a rapid vibration it was found quite easy to perform the following curious experiment. The bars B and B_1 were joined at the top by a low voltage lamp L_3; a little lower was placed by means of clamps C C a 50 volt lamp L_2 and still lower another 100-volt lamp L_1, and finally at a certain distance below the latter lamp an exhausted tube T. By carefully determining the positions of these devices it was found practicable to maintain them all at their proper illuminating power. Yet they were all connected in multiple arc to the two stout copper bars and required widely different pressures. This experiment requires, of course, some time for adjustment, but is quite easily performed.

In Figs. 19 B and 19 C two other experiments are illustrated which, unlike the previous experiment, do not require very careful adjustments. In Fig. 20 B, two lamps L_1 and L_2, the former a 100 volt and the latter a 50 volt, are placed in certain positions as indicated, the 100 volt lamp being below the 50 volt lamp. When the arc is playing at D D and the sudden discharges passed through the bars B B the 50 volt lamp will, as a rule, burn brightly, or at least this result is easily secured, while the 100 volt lamp will burn very low or remain quite dark, Fig. 19 B. Now the bars B B may be joined at the top by a thick cross bar B_2 and it is quite easy to maintain the 100 volt lamp at full candle power, while the the 50 volt lamp remains dark, Fig. 19C. These results, as I have pointed out previously, should not be considered to be due exactly to frequency but rather to the time rate of change which may be great even with low frequencies. A great many other results of the same kind equally interesting, especially to those who are only used to



ATLANTIC FAN MOTOR.

manipulate steady currents, may be obtained and they afford precious clues in investigating the nature of electric currents.

In the preceding experiments I have already had occasion to show some light phenomena, and it would be now proper to study these in particular; but to make this investigation more complete I think it necessary to first make a few remarks on the subject of electrical resonance which has to be always observed in carrying out these experiments.

Acme Portable Testing Set.

The Acme portable testing set, illustrations of which are presented herewith, comprises a Wheatstone bridge, rheostat, D'Arsonval galvanometer, aluminum-iodine battery and double contact key, all contained in a mahogany case weighing less than six pounds complete. The leather case illustrated in Fig. 1 is very convenient when the apparatus is used by inspecting engineers, as it can be slung over the shoulder and carried as readily as a small hand bag.

The coils in both bridge and rheostat are wound with platinoid wire, and adjustments are made with great care. The arrangement is similar to the "post office" design, with three coils in each bridge arm, and 18 coils in the rheostat, giving a total range by means of the reversing attachment of from .001 ohm to 11,110,000 ohms.

The galvanometer is a modified form of the D'Arsonval type, strongly built, and perfectly dead-beat. Magnetic fields and mechanical vibrations, it is claimed, produce no effect whatever, and the instrument will give as accurate indications in the street, on shipboard or in the dynamo room as in a college laboratory.

The battery is of the new aluminum-iodine form with an electromotive force of one and four-tenths volts per cell, or equivalent to a total of 17 volts.

In Fig. 2 A and B represent the two proportional bridge arms, R is the adjustable rheostat, and X the unknown resistance or line. In Fig. 3 the arm A of Fig. 2 is equivalent to the coils, 1, 10, 100, on the left hand center row, and the arm B to the coils 10, 100, 1,000 on the right hand of same row. The rheostat R corresponds to the coils of the top and bottom rows, aggregating 11,110 ohms, and X, the unknown quantity, is connected

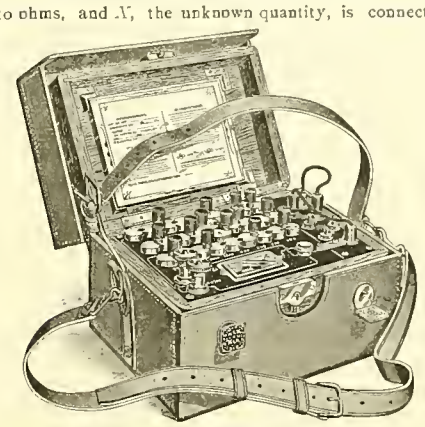


FIG. 1. ACME PORTABLE TESTING SET.

between the two binding posts at the lower left hand corner

In Fig. 3 the blocks A, R, B and X are connected to the bridge arms and are the same as shown in the center of Fig. 2. They constitute the reversing arrangement whereby the bridge arms may be interchanged, and six coils be made to do the work of eight. Thus, when one plug is placed between A and R, and another between X and B, the order of the arms working clockwise, and beginning with R, will be $R : X :: B : A$. If the plugs are changed so as to connect A to X and R to B the order will be $R : X :: A : B$. By this means it also becomes possible to readily detect inaccuracies in the bridge ratios should any exist, and to eliminate them entirely in work. Thus, if the two 100 ohm coils of the proportional arms are slightly different this fact becomes evident in practice by reversing and balancing them. If with a given unknown resistance the resistance in the rheostat has a different value in one case than in the other, the two bridge coils must be slightly different, and the correct value of the unknown will be the mean of the two rheostat resistances used in obtaining the two balances.

The manufacturers of this set are Queen & Co., incorporated, Philadelphia. The firm is anticipating a large demand, and is holding itself in readiness to meet its orders and undoubtedly will push the set well to the front.

The Lundell Exhaust Fan Outfit.

In the accompanying illustration is presented a new outfit which is a combination of an ordinary exhaust fan directly coupled to a slow speed Lundell motor. The absence of belting and the noiselessness of the outfit are particularly noticeable. In restaurants this outfit, by being judicially placed, will serve to exhaust the air both in the restaurant and kitchen as well. It is adopted for all places, and is a sure means of keeping the air in a pure and wholesome condition. The Lundell exhaust fan outfit is placed on the market by the Interior Conduit & Insulation company.

Electric Railway System for Indiana.

An interesting story comes from Indianapolis in which it is said that the Central Indiana Electric Railway company contemplates an electric system on a larger scale than has as yet been attempted in this country. The capital stock is $1,500,000. The officers are J. T. Baker, president; W. B. Keep, first vice-president; Thomas Wilkinson, second vice-president; N. D. Pontius, secretary; R. T. Wilkinson, treasurer, and Dr. T. A. Gesner, general manager. The central point of the proposed system, at which will be located its general offices, power house and car and machine shops, is Noblesville, twenty miles north of Indianapolis.

The ramifications of the Central Indiana Electric Railway company will extend to the principal cities of the

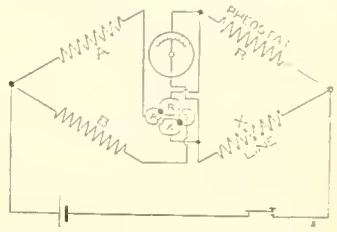

FIG. 2. ACME PORTABLE TESTING SET.

Indiana gas belt and its outskirts. A double-track system, according to present plans and specifications, is to extend from Noblesville to Indianapolis. A line to the west will extend to Lafayette by way of Frankfort. A line north will reach Kokomo and branch thence to Logansport and Peru. Another line northeast will connect with Elwood and thence with Marion and Fort Wayne. Another will extend to Muncie by way of Anderson.

To complete this system will require about 500 miles of main track. The company proposes to operate a city railway system at Noblesville, and the council of that city has granted a franchise for thirty years. The proposed plan contemplates through and local trains for passenger traffic, with express and mail cars, as well as freight trains, and it is said that passengers and express and freight matter will be transferred as rapidly as on any of the steam railroads of the state.

The promoters of the project assert that they have enlisted capital from Philadelphia, Chicago and London, and that ample means are at at hand for the construction and equipment of the lines. The trolley system is to be employed at the start, but if the storage battery system is perfected so as to become practicable it will be substituted. The work of construction is to be commenced at once, and the line between Noblesville and Indianapolis is to be in operation by early autumn.

Atlantic Fan Motor.

In the accompanying illustration is presented the latest type of the Atlantic fan motor. This motor is possessed of a novel armature so constructed and wound as to utilize the induction currents. The high efficiency, which, in consequence of this construction, is claimed for the motor is a special feature which will attract the attention of the trade, and no doubt secure for the

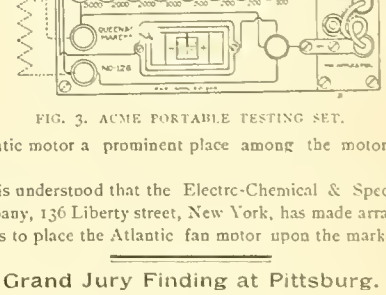

FIG. 3. ACME PORTABLE TESTING SET.

Atlantic motor a prominent place among the motors in use.

It is understood that the Electro-Chemical & Specialty company, 136 Liberty street, New York, has made arrangements to place the Atlantic fan motor upon the market.

Grand Jury Finding at Pittsburg.

A dispatch from Pittsburg, dated June 7th, announces that the grand jury has returned true bills for conspiracy against C. A. Coffin, of Boston, president of the General Electric company; W. J. Clarke, of Lynn, Mass., manager of the railway department; Milton H. Hamilton, of New York, E. W. Rice, of Lynn, and H. W. Knight, of Boston. All these gentlemen are officials of the General Electric company. True bills were also found against Morris W. Mead, superintendent of the bureau of electricity in Pittsburg for conspiracy, and against C. E. Christian, John Butler and Frank Carey, former employes of the Westinghouse company, for conspiracy and larceny.

CORRESPONDENCE.

New York Notes.

NEW YORK, June 10.—What promised to be a dull session of the Rapid Transit commission on Wednesday was enlivened by a "set-to" of considerable earnestness and warmth between Commissioners Starin and Spencer. The latter accused the former of making a "business mistake" in opposing the attempts to come to terms with the Manhattan Elevated Railroad company. "Well," replied Mr. Starin, "I didn't have that interest in it that you had." Mr. Spencer, white and trembling with anger, said "If any man says that I have acted in this commission in advocating what was best for the city in the form of extensions to the present elevated system from any interested motives whatever, he is either so ignorant of the subject that he is not entitled to have an opinion or he has a lie in his throat while he utters it. He can take either horn of that dilemma that he wants to." Mr. Starin stated that he didn't propose to take either. Then followed some quite picturesque dialogue, in which personalities and recriminations were freely interwoven. Mr. Starin accused Mr. Spencer of having made a certain compromising statement with regard to the Manhattan system. Mr. Spencer retorted: "That statement is absolutely untrue." Mr. Starin threw his head back defiantly, with the remark: "One misfortune with me is that my memory is good." "That isn't your only misfortune," returned Mr. Spencer, and so the altercation went on until the chairman was reduced to a state of despair and nervous exhaustion, and all hope of any real business being arrived at, much less accomplished, had to be abandoned. One little incident throws a light on the engrossing nature of the interchange of rhetorical fireworks between the two commissioners. At an early stage of the meeting business appeared to be proceeding slowly, and Mr. Inman, one of the commissioners, who is somewhat deaf, is said to have laid down his ear trumpet on the table and remarked: "Down in the country where I lived everybody turned out for closing exercises at the school. One old fellow in the rear of the crowd found the proceedings tiresome, and thought he would take a nap. So he said to the man next to him, 'If anything good comes along, kick me.' I say, now, if anything happens worth my listening to, give me a shove." Soon after Mr. Inman put up his ear trumpet without being shoved and kept it in place until the meeting adjourned. The next day four of the Rapid Transit commissioners resigned and left Mr. Starin to hold the fort. This is probably the last stage of the present rapid transit fiasco, and everything now awaits the pronouncement of the mayor. As has been pointed out by a leading daily, the most sanguine could hardly expect any result from the work of such a commission that would be unreservedly for the public good. The Tammany taint was on it from the beginning. A Tammany lawyer was its counsel. Rumors and almost definite allegations that Tammany had struck a bargain from the beginning with the elevated roads, and was pledged to prevent any feasible underground system, hampered and handicapped it all the way through. There was the ideal system of an electric underground road, with all its immense advantages, that could have been working within two years, waiting and ready. It is scarcely to be supposed that capital would have been forthcoming, in the enormous amount required, even if a reasonable and practicable plan of underground transit had been devised by the commission. To-day it seems as if either the work of the last two and a half years will go for nothing, and the rapid transit farce will have to be played over again, or that the one remaining hope of rapid transit will lie in allowing the Manhattan company to do whatever its own interests may dictate, upon such terms as its officers and directors may propose.

The franchise of a New York city street railroad is worth paying for. The cable cars now running on Broadway take an average of $10 per trip, as against the horse car average of $4.70. There were thirty cable cars running yesterday, and, according to the present schedule, the gross earnings of the Broadway road will be over $10,000 per day.

Even Brooklyn wakes to life when street railroad options are wooing the spirit of enterprise. Last night the railroad committee of the Brooklyn Board of Aldermen met in the city hall to listen to propositions for using the streets for electric traction. The two competing corporations were the Union Street Railroad company and the Nassau Electric Railroad company. The Union offered to pay $15,000 a mile for the old Union street and Ninth avenue route, and, in addition, $10,000 a mile for several streets in the eastern district of Brooklyn and East New York and the Plaza. The representative of the Union, Mr. Gaynor, got the committee to promise that, in case anybody should outbid him, he would be notified and given the opportunity to raise his own offer. The representative of the Nassau company, on the other hand, states that his company is prepared to pay any price the aldermen may set for a franchise for the same streets, and impose no limit.

A meeting of the East River Bridge commission was held yesterday to hear arguments for and against the approaches to the new bridge and the condemning of property therefor. The kind of argument that obstructionists will fall back upon when they have nothing else to rely on was illustrated when Fordham Morris appeared for the property holders and urged that the present Brooklyn bridge had injured New York, because it induced people who would without it live in New York to live across the East River. "The only elevated roads which should be allowed in New York," said Mr. Morris, "are longitudinal ones." The two proposed new bridges, he said, would add to the injury, and the people of the city ought not to be encouraged to leave it. Mr. Uhlmann, on behalf of the Bridge commission, declared that the increase in the assessed valuation of property in Brooklyn and New York since the introduction of the elevated roads had been 65 per cent. in New York and 51 per cent. in Brooklyn.

On the 6th the linemen's strike was declared over, but the trouble has revived. President Cutler directed the strikers of the New York & New Jersey Telephone company, employed on the New Jersey division, to go to work, promising to consider their demand for increased pay. About two-thirds of the strikers returned to work, but others were informed that their services were no longer required. During the strike the company engaged non-union linemen and made yearly contracts with them. These men now fill the places of the strikers, and those of the strikers who were ring-leaders are discarded. The linemen who returned to work insisted that the company should reinstate all the old men, and this the company refused to do. It is thought, however, that an amicable settlement will be reached.

A case in which the liability of a telegraph company is defined has just been tried in the New York City Court. James Reilly, who brought an action against the Western Union Telegraph company, owns a sloop, which, on September 13, 1892, was at Bath Beach, L. I. On that day the weather was stormy, and Mr. Reilly sent a telegram from the Western Union office, at Grand and Hester streets, at 12:15 P. M. to a man in charge of the boat, with orders to put it in a place of safety. The telegram was not delivered until 2:30, and in the meantime the boat was badly damaged. Mr. Reilly sought to recover $234.50 damages. The Western Union, when sued, contended that it was absolved from liability on account of the contract on the message blank. The court and jury, however, rendered a verdict for the full amount, with interest and costs. W. F. O.

New England Notes.

BOSTON, MASS., June 10.—The legislature has modified the underground wire bill so that it now applies to all overhead wires except the trolley wires. But before this bill goes into effect, taking it for granted that it will pass, a large portion of the wires of the city will be underground or in process of being placed there by the own volition of the companies operating them. The present law allows electric companies to place their wires under the streets by obtaining permission of the local authorities. There are probably 20,000 miles of electric wires in the vicinity of Boston. The New England Telephone company has about half of this mileage, and the remainder is divided between the city of Boston fire and police alarm wires, the Edison, Boston Electric, Western Union, Postal Telegraph, District Messenger and a few smaller concerns. Of this mileage more than half is already underground. Three-quarters or more of the New England telephone wires are in the conduits, and about two-thirds of the Western Union and the Edison companies about the same. But the Boston Electric Light company's wires are all above ground. The city of Boston has been very backward in putting its own wires underground. The conduits of the telephone company have been completed about five years and the city has the right to use them, but the work was not begun till last fall, and of the 1,300 miles of wire belonging to the city not a tenth part is under the surface.

The West End Street Railway company is soon to try the plan of welding its rails together, forming a continuous line. This is to do away with the jolting, the rapid wearing away of the ends of the rails where the joint comes, and prevent the loss of power as well as injury to underground wires and pipes, caused by a leakage of power. The rails forming an unbroken line they will form a return circuit. The process to be used is that devised by the Johnson company of Johnstown, Pa., in conection with the Thomson Electric Welding company. A welding machine has been built at Lynn for this purpose. The apparatus is mounted on wheels to be run on the car tracks and is larger than an ordinary electric car. It is divided into sections, in one of which is placed the motor-dynamo, the switchboard, etc. In another are large tanks of water which furnish hydraulic power for some of the adjustments by means of an electric pump and also provide a cooling circulation about the clamps of the welder. The welder is suspended from the forward end by a crane. The current from the trolley wire is transformed by the motor-dynamo into an alternating current of lower pressure and greater volume and is in the welder again transformed into a current with a voltage of about 6 or 8 and amperage of about 30,000. Fish-plates are placed on both sides of the joint, and after they are brought up flush the clamps of the welder are fastened upon them and the current welds them in about five minutes.

The West End has finally won its fight in the legislature against the incorporation of the Storage Battery Street Railway company, with right to use the West End tracks from Cambridge to Boston. The senate by a vote of 5 to 29 refused to pass the bill to a third reading. This action was taken after members of both legislative bodies had been to Milford on invitation of the storage battery people and inspected the operation of the system there.

The rapid transit bill has been somewhat modified by the finance committee to whom it was submitted after being reported favorably by the rapid transit committee. The changes provide that tenure of office of the commission shall be for four years, and that two of the members shall be residents of of Boston, and be removable by the governor at any time. Consequential damages from the elevated road or subway are expressly forbidden, the forfeited property if the operating contract is not kept, is to be the property of the city of Boston. The route is to be from Causeway street to Franklin Park, the width from 25 to 80 feet north of Court square, and from 25 to 35 feet south. South of the north end of Shawmut avenue the route is to be between that avenue and Tremont street.

One by one the obstacles in the pathway of rapid transit are being removed. It has been said by many who have appeared at the state house this session in opposition to an elevated road that it would be impossible for any one to raise the necessary backing for such a scheme. This idea was dispelled upon the receipt of a letter from the firm of Leland, Towle & Co. of Boston by the rapid transit committee, which stated that it was ready to build, equip, maintain and operate an elevated railway in Boston and suburbs. Leland, Towle & Co. is a reputable firm of bankers of the highest standing on State street.

The West End Street Railway company of Boston has declared a dividend of 4 per cent. for the first half of the current year. This will make the annual dividend 8 per cent. instead of 10 per cent. as in the past. The action was taken because it was considered that the higher figure was more than the company could pay in justice to itself until its construction work was completed. The reduction had a bracing effect on the stock in the market, as it was considered a conservative move.

The streets of Colebrooke, Me., are to be lighted with electricity.

The new power house of the Newton & Boston Street Railway company will be completed by July 1st.

Ground has been broken for the new battery shop of the Hopedale Electric company.

The town council of Johnston, R. I., has granted the Union Railroad company a 20-year franchise. It is given on condition that the company build a new route on Hartford avenue, and extend the Manton avenue route some 2,000 feet. The company is also to pay half of 1 per cent. of its earnings to the town.

The first arc machine of the new Westinghouse type is to be put in the station of the Canton Electric Light company.

The new electric road between Waltham and Watertown is open for travel The line is three miles long and cost $100,000.

The electric power plant at Tariffville, Conn., is nearly ready for operation. The power is to be transmitted 11 miles to Hartford. The generator is wound for 600 volts, but the current is transformed to 3,000 volts and then transmitted to the outskirt of the city where it is transformed back to 600. It will operate a motor of 315 horse power. This motor runs a long shaft on which are belted generators and dynamos which run arc and incandescent lights and motors. Not a pound of coal is used in the whole operation. J. C. E.

PERSONAL.

Ludwig Gutmann, electrical engineer, spent a few days in Chicago last week.

George Cutter, Chicago, left last Saturday for a brief business trip to Boston and New York.

M. J. Sullivan, so long identified with the *Street Railway Gazette*, Chicago, has accepted a position with the *Electrical World*, and will act as its World's Fair business representative during the period of the exposition.

C. S. Colton, formerly motor salesman of the General Electric company, Chicago, has severed his connection with this company, and has taken charge of the alternating motor department of Taylor, Goodhue & Ames, Chicago.

It is announced that George Cawley is about to retire from the position of chief editor of *Industries*, London, to engage in business as consulting engineer. Mr. Cawley has occupied his present position since the establishment of *Industries*, and is entitled to much praise for the able manner in which he has conducted that journal. Upon Mr. Cawley's retirement it is reported that there will be a complete change in the management of the enterprise.

NEW INCORPORATIONS.

Voorhees Electric company, Boston, Mass.; capital stock, $5,000; to manufacture and sell electrical appliances.

Twin City General Electric company, Ironwood, Mich.; capital stock, $400,000; to do electric lighting and railway business; E. D. Nelson, Ironwood, Mich.

Fairmount Railway company, Denver, Colo.; capital stock $10,000; to build an electric railway from Fairmount Cemetery to Montclair in Arrapahoe county, Colo.

Palouse Electric company, Palouse, Wash.; capital stock, $30,000; to engage in the business of public and private lighting by electricity; A. P. Fuller, Portland, Ore.

Miamisburg Electric company, Miamisburg, O.; capital stock, $100,000. manufacturing and dealing in all kinds of electrical and other machinery and appliances; Amos R. Clay, Miamisburg, O.

Jackson Electric Railway, Light & Power company; Jackson, Ia.; capital stock, $250,000; to carry on a general electric railway and power business in Jackson, Miss.; W. E. Hayne, Jackson, Miss.

Walker & Bedford Electric Alarm company, East St. Louis, Ill., capital stock, $300,000; to manufacture and deal in electric alarm money drawers, etc.; Keller & Starek, 142 North Broadway, St. Louis, Mo.

Tekoa Electric company, Spokane, Wash.; capital stock, $20,000; to engage in the business of public and private lighting, heat and power; to operate telephone and telegraph lines; W. T. McCaskey, Spokane, Wash.

Monterey & Pacific Grove Street Railway & Electric Power company, Monterey, Cal.; capital stock, $180,000; to build and operate a street railroad and generate and supply electricity for all purposes; R. H. Willey, Monterey, Cal.

Continental Gas company, Chicago, Ill.; capital stock, $10,000,000; to manufacture and deal in gas and electricity; to erect, maintain and manufacture plants, appliances, etc., for the operation of the same; John W Carrington, Jr., Phenix building, Chicago, Ill.

Donahoo Steel & Smelting company, San Francisco, Cal.; capital stock, $500,000; to deal in iron, coal, timber and other lands; to mine, mill and smelt ores; to manufacture iron and steel, fuel gas, electricity, etc.; Edward R. Taylor, San Francisco, Cal.

Lawrence Electric company (incorporated in W. Va.), New York, N. Y.; capital stock, $1,000,000; furnishing electricity, acquiring patents, etc., relative to the construction of electric plants, furnishing motive power for cars, boats, etc.; George M. Pinoey, 44 Pine street, New York, N. Y.

ELECTRIC LIGHTING.

The question of establishing an electric light plant at Hart, Mich., is being agitated.

The New Orleans, La., city and lake railroad is being rapidly changed to adapt it to electric power.

The electric lighting plant which is to supply Tucson, Ariz., with street lighting is nearly completed.

The Haverford, Pa., Electric Light company is rebuilding its electric light plant, which was recently destroyed by fire.

An electric lighting plant is to be installed at the new town of Eastland, in Marin county, Cal. About 1,000 incandescent lights will be required.

The Missouri Electric Light & Power company has transferred its property and good will to the Municipal Electric Lighting & Power company, both of St. Louis. About $1,500,000 is involved in the transaction.

Work has been commenced removing the electric light towers in Pittsburg, Pa. They cost $800 each and it is said proved very unsatisfactory. Bonds to the amount of $100,000 to cover the cost of changing the system have been issued.

The local authorities have made a contract with the Brattleboro, Vt., Gas Light company to furnish arc lights for street lighting for a term of five years. The rate fixed is $90 per light a year.

Although electric lights are in general use on lake steamers the first trouble from crossed wires occurred on the new steamer, Selwyn Eddy, at Buffalo, N. Y., last month. Only three hundred bushels of grain were burned, but the smoke damaged the entire cargo of oats and the loss will be $100,000.

San Francisco and Los Angeles capitalists will put up an electric light plant in Monrovia, Cal., to run by water power obtained from the Saw Pit canon near that place for supplying the town and four neighboring towns with electric light and to run a projected electric railway from Monrovia via Pasadena to Los Angeles.

A special election was recently held in Paw Paw, Mich., on the question of bonding the place for the sum of $15,000 for the purpose of putting in an electric light plant. The proposition was carried but it is considered doubtful if the legal authority exists for the issue of bonds and it is possible that the matter will find its way into the courts.

The municipality of Munich has decided to adopt the electric light for the illumination of the principal thoroughfares, squares and public buildings, and to begin with a plant of 300 arc lamps for the streets and 1,800 incandescent lamps for the town hall. A considerable extension for the installation is to follow. The whole of the work has been intrusted to the firm of Schuckert & Co., Nuremberg, who undertake to complete the installation by October.

Considerable progress is now being made in the matter of electric lighting in Japan. Three new central stations, located respectively at Hamamatsu, Maibashi and Nikko, will be opened this month or next. The power in each case will be furnished by Pelton water wheels, which will drive 2,000 volt alternating current dynamos. The entire equipment will be constructed in Japan, even to the incandescent lamps. Nikko is a famous summer resort. All three of the cities are small and do not require more than 500 or to 1,000 incandescent lamps each.

ELECTRIC RAILWAYS.

Hillyard, Wash., proposes to have an electric railway.

Wabash, Ind., is considering the subject of electric railways.

The Amsterdam Street Railway company, Amsterdam, N. Y., will extend its lines to Fort Johnson.

It is expected that the Natchez, Miss., street railway will be operated by motors before January 1, 1894.

An electric railway between the two large Massachusetts cities, Lowell and Lawrence, is now but a question of time.

The Holyoke, Mass., Street Railway company contemplates the extension of its electric lines to the summit of Mt. Tom.

The construction of an electric railway between the towns of Malmö and Lund, in West Sweden, is under contemplation.

The Milan, Italy, council has authorized the Edison company to run an electric road two miles long for one year as an experiment.

The contract for building an electric line from Decherd, Tenn., to Winchester has been signed, and the road is to be in operation within six months.

The Arlington branch of the Pikesville & Pimlico electric road, controlled by the Baltimore Traction company, Baltimore, Md., has recently been completed.

It is said that the Chicago & St. Louis electric road has secured right of way through Fairbury, Ill., and the citizens of that town, it is reported, are raising $10,000 for the road.

The Muskegon Terminal Railway company, Muskegon, Mich., has been granted a right of way from the eastern boundary of the city along Eastern avenue and Clay avenue to Cedar street.

A movement is on foot among the business men of Mason, Bracken and Robertson counties, Kentucky, to secure the right of way for an electric line from Mt. Olivet to some point on the Chesapeake & Ohio road.

The new electric railway between New Albany, Ind., and Louisville is now being built, and the company expects to have the cars running soon; this line will reduce the time between the two cities twenty minutes.

The Pleasure Resort Railway company, with a capital stock of $100,000, has been formed to build an electric line from Denver, Colo., to North Denver, and to eventually extend it to Rocky Mountain and Berkeley Lakes.

The amended electric street railway bill having passed both Houses of Connecticut, it is quite likely that there will be an era of electric railway construction in the near future in the state, as something like seventy companies are said to have applied for charters.

An ordinance has been passed by the city of Trinidad, Colo., granting a franchise over certain avenues and streets of the city to the Trinidad, San Luis Valley & Pacific Railway company for laying tracks and constructing telegraph and telephone lines.

An enterprise is on foot to connect the towns of Waterloo, Garrett, Auburn, Ashley and Hudson, Ind., by an electric railroad. Rights of way will be asked of the town councils and board of county commissioners along the streets and public roads of the proposed lines.

The Union Electric Railway company, New York, has gained possession of the lines of the Westchester Electric company, which, when completed, will run from the Hudson River to Long Island Sound. The Union company will extend its present system from Fordham, meeting and connecting with the new line at Woodlawn. It is stated that the Union company has also acquired title to all of the other lines operated in the lower part of Westchester county.

The Canadian General Electric company, which recently received the concession for an electric tramway at Peterborough, Ont., has amalgamated with the Peterborough & Ashburnham Railway company under the charter of the latter for the purpose of constructing and operating the line.

The Calumet Electric Railway company, which operates a number of cross-town lines on the South Side, Chicago, has just completed arrangements with a number of railroads entering the city to transfer all their World's Fair passengers from the suburban station at which the road crosses the electric line to the fair grounds. The roads which have entered this agreement include the Rock Island, Marion, Erie, Baltimore & Ohio, Wabash, Pennsylvania and Lake Shore. A number of new cars will be added to accommodate the increased traffic.

TELEPHONE.

During the next few months Los Angeles, Cal., and San Francisco will be in direct communication by telephone, the wires running approximately along the course of the Southern Pacific railroad to San Luis Obispo, and from there through Santa Maria, by the way of Guadalupe, and from Santa Maria to Lompoc. The work is being pushed as rapidly as possible, and is to be of the most substantial character. A heavy copper wire is being used, weighing 460 pounds to the mile. The transportation of the poles has cut a large figure in the cost of the enterprise. The poles each weigh about 700 pounds.

MISCELLANEOUS.

An ordinance is to be introduced in the Baltimore City Council, it is said, providing for a tax of two dollars on each electric light, telephone and telegraph pole, and on each trolley pole which carries wires other than those in use by the railway.

A company has been organized and application has been made to the city for a franchise to construct underground conduits for electric wires in Syracuse, N. Y. A company has also been formed at Utica for a like purpose.

TRADE NEWS.

The Ansonia Electric company has just effected a large sale of Shield brand wire in Iowa. The wire continues to give every satisfaction.

The Montreal Street Railway company is equipping its new power house with Westinghouse multipolar generators supplied by the Canadian agents, Ahearn & Soper, Ottawa.

The American Circular Loom company of Boston has made arrangements with C. E. Woodruff & Co., 235 Lake street, Chicago, for the sale of its canvas jacket covered wire.

That mica is rapidly being adopted by the leading electric concerns for insulation purposes is evidenced by the large increase in sales of Eugene Munsell & Co., of New York.

The American Cotton Oil company, New York, is having its mills in Arkansas rewired with Okonite wire and all modern safety devices placed under the supervision of T. L. Rose, electrical contractor, of Little Rock.

The Buckeye Electric company, manufacturer of incandescent lamps and appliances, is having a large sale for its double coil filament, 32 candle power lamp. This lamp is one of remarkable durability and illuminating power, and is sure to be one of long continued popularity.

The Hart & Hegeman Manufacturing company, of Hartford, Conn., manufacturer of Hart switches, reports that, that during the month of May the sales were larger than during any previous month since it has been in business.

Charles L. Livingston announces that he is prepared to contract for the complete equipment of electric street railways, central stations, isolated plants, etc. Special attention will be given to wiring of fine residences, business blocks and churches. His office is located in the Fidelity building, 121 Fourth avenue, Pittsburg, Pa.

The Iowa Electric & Construction company, 508 Walnut street, Des Moines, Ia., successor to the Hess Electrical company, is prepared to do all kinds of electrical construction work, particular attention being paid to central station and isolated light plants, electric combination and gas light fixtures, electric motors and dynamos, electric bells, burglar alarms and annunciators.

Secretary F. W. Davis, of the Perkins Electric Switch company, of Hartford, Conn., reports that his company was never more busy than at present. The demand for its new lamp socket, which possesses many features of distinctive merit, has been most satisfactory. The calls for its new dove-tail ceiling rosette have largely increased since January 1st.

The Eureka Tempered Copper company, North East, Pa., has issued a tastefully compiled little book as a souvenir of electricity building, World's Columbian Exposition. The pamphlet contains many endorsements as to the efficiency of Eureka tempered copper wire, and also the statement of the sub-committee of science and arts, Franklin Institute of Philadelphia, in awarding to the company the John Scott medal.

The Heinze Electric company of Lynn, Mass., has been obliged recently to run its factory over-time to meet the demand for its new fan motor which operates on both alternating and direct currents, and which will run for a long time without attention. These features recommend it to

the trade as a first-class fan motor. This company has also under way a new line of instruments which it expects to become popular in the electrical trade.

Purchasers of insulated wires of all kinds will be interested to know that the Chicago Insulated Wire company has decided to remove its Chicago office to Sycamore, Ill., to which place all communications should be addressed. The Chicago Insulated Wire company has for some time occupied an office at 214 Northern building, Chicago, but the company lately decided that its business would be greatly facilitated by the location of its offices at the works in Sycamore, Ill.

The John Hopkins University of Baltimore has issued its register for 1892-93. Full particulars pertaining to the branches of studies pursued are given. Electrical engineering is given a prominent place, the course extending over a space of two years. It is intended to fit students for work on the latest advances in electrical science and the practical electrical problems of the day, especial attention being paid to the subject of electrical transmission of energy and to electric railroad work.

The J. H. & D. Lake company, manufacturer of all kinds of friction clutch pulleys, having outgrown its old quarters at Hornellsville, N. Y., has recently completed and removed to its new offices and foundry at Massillon, O., where with enlarged facilities, it is prepared to meet the growing demands of its business. An interesting feature regarding the rapid growth of the Lake company is the fact that it came almost exclusively from advertising, for with the exception of a limited amount of traveling, it has had no representative, except its card in the various trade jouroals.

The University of Minnesota, Minneapolis, has earned a well-deserved reputation for thorough equipment and capable instruction in its various departments, and there is none more complete than the electrical engineering branch. It is associated with the department of physics, without being made at all subservient to it, and has free use of all its apparatus and facilities for work. The electrical department includes three rooms for sensitive instrumeats, a dynamo room, battery room, four laboratory rooms, photometer, photographic, library and reading rooms, and offers particular advantages to one contemplating an electrical engineering course. A catalogue has just been published.

The recognition of the dangers attending the use of cotton waste in machine shops and manufacturing works has led to the establishment of the industry of manufacturing machine towels from silk waste. The office of this enterprise is located at 809 North Second street, St. Louis. It is known as the American Silk Manufacturing company. One feature of these towels, not the least important, is the thoroughness with which they clean machinery. They not only leave no small fiber to work into the finer parts of the machinery, and thus in time affect it to such an extent as to necessitate repairs, but they possess the property of taking up and retaining in their meshes any rust or particle of foreign matter with which they come in contact. Add to this the fact of their incombustibility and their cheapness, and it would appear that they were the ideal machine wipers.

George Porter, electrical contractor, 143 LaSalle street, Chicago, has just closed a deal with the Claremont hotel, Thirty-sixth street and Vincennes avenue, for the installation of a 700 light plant. The Claremont equipment will be a 90 horse power Westinghouse engine driving two Edison 360 light machines. Mr. Porter has also closed a contract to fit up the Cleopatra Sarcophagus, 335 Wabash avenue, with two electric light signs, one to be placed over the entrance to the building, and the other to be hung over the entrance to the tomb proper. The sign over the ontside entrance will be formed of white 10 candle power incandescent lamps. These lamps, through the agency of a motor driven commutator, will spell alternately the words "Cleopatra" and "Sarcophagus." The inside sign over the tomb will read "Cleopatra." Mr. Porter has also made a recent sale of thirty-five Holtzer-Cabot fan motors, and on his contracting work alone has now employed as many as twenty-four men. Such work as this speaks for itself.

Continued prosperity is evident from a perusal of the ninth edition, of the revised catalogue of W. R. Ostrander & Co., 204 Fulton street, New York. Since the issue of its last catalogue the company has added several new lines of electrical specialties, and enlarged its stock, until it presents one of the most complete and varied assortments before the public. The last catalogue comprises six systems: Speaking tubes, electrical call bells, electric burglar alarms, electric gas lighting, mechanical door bells and pneumatic call bells. Each system embraces all the branches of its department, and with the help of numerous illustrations presents its matter in a handy, compact form. As for the subject matter itself, it may be said that no more complete and varied stock has solicited attention from the trade. Covering as it does the whole field electrical appliances it cannot fail to attract the attention of electrical people. The firm has the advantage of a recently enlarged factory, which, with its force of skilled mechanics, give it exceptional facilities for filling all orders promptly.

BUSINESS.

The Central Electric company, Chicago, is furnishing the *Sentinel* building at Milwaukee with conduit and fittings, made by the Interior Conduit & Insulation company, for which it is the western agent.

The Marion Street Railway company of Marion, Ind., has commenced work on a line of road to Gas City via the Soldiers' Home. The Ansonia Electric company's new line of overhead railway fixtures will be used on the entire road.

C. E. Newton, of the Jewell Belting company of Hartford, Conn., desires to extend to the electrical fraternity a cordial invitation when visiting the fair to inspect the company's exhibit of belting, which is located at electricity building, F 6, ground floor.

The Electrical Piano & Motor company of Newark, N. J., manufacturer of the Feldkamp electro-magnetic fan, reports large sales for its fan in Texas. These fans are simple, noiseless and easily attached to a hook in the ceiling, and there is no chance of burning out.

Captain W. L. Candee, of the Okonite company, is spending a few days in Chicago looking after the company's exhibit at the Fair. The Okonite factory has been very busy and has been delayed in this particular, but the work is now well under way and it promises to make a creditable showing.

O. K. weather proof insulated copper wire continues to give its former satisfaction for use in line and house wire work, and feeder wires for railway work. As placed on the market by the Electrical Engineering & Supply company, St. Paul, Minn., its northwestern agent, it is sure to be pushed to the front.

The improved cable supporter for aeriel telephone, telegraph and electric cables, manufactured by O. N. Bender & Co. of Providence, R. I., is being adapted very largely for the support of wires, etc. One hanger will support 150 pounds. They are made in brass or zinc. This company is very busy with orders.

The Tice-Lintner Electric company, Minneapolis, Minn., manufacturer of electrical specialties, has been so successful in the electrical field that it has been obliged to remove its factories to Gladstone, Mich., where it anticipates a better location for shipment.

J. H. Cooke, western representative of the Buckeye Electric company, has in stock at Chicago 35,000 Buckeye lamps of standard voltage and candle power. The number will be increased to 50,000 as rapidly as possible to meet the heavy orders that are making the lamp one of the best sellers on the market. The factory of this company is located at Cleveland, O., and the western office at 182 Jackson street, Chicago.

The Eddy Electric Manufacturing company of Windsor, Conn., has recently appointed B. M. Barr as its representative for several middle states, with an office at 816 Cuyahoga building, Cleveland, O. Mr. Barr has a large and extensive acquaintance in the electrical field, being for many years connected with the Thomson-Houston company, and will no doubt prove a valuable acquisition to its business staff.

Former purchasers are taking advantage of the fact that the Ansonia Electric company can again furnish the old standard Sunbeam incandescent lamp. The orders are coming in daily in such abundance as to give truth to the statement that it has regained already its previous hold on the trade. This company, formerly known as the Electric Supply company, continues to enjoy the best of reports from its W. W. lightning arrester.

Queen & Co., incorporated, Philadelphia, have a new specialty in the Acme portable testing set, described elsewhere in these columns, which can hardly fail to meet with great favor. It is remarkably compact and complete, all necessary parts, including battery, being contained in one small and handsomely finished mahogany case that weighs only six pounds. The set is particularly well adapted to outside testing, but gives equally accurate results in central stations or factories and on shipboard. It will be extensively handled by the trade as a standard article.

ELECTRICAL PATENTS.

Issued June 6, 1893.

498,757. Insulated Conductor. Thomas F. Attix, Brooklyn, N. Y.

498,758. Lamp Socket and Key Holder Therefor. Henry P. Ball and Amandus Metzger, Schenectady, N. Y.

498,763. Electromotive Device. Romaine Callender, Brantford, Can.

The electromotive device comprises an electro-magnet adapted to act upon its armature, which is carried upon a pivoted lever. The armature is yieldingly held away from the magnet by a spring, and when attracted acts upon a pawl to rotate a ratchet wheel, from which power may be derived. The motion of the lever cuts resistance into the circuit containing the electro-magnet, thereby weakening it and permitting the armature to be withdrawn by the spring. Repetition of the operation continuously rotates the ratchet wheel.

498,768. Electrolytic Apparatus. Thomas Craney, Bay City, Mich.

498,769. Method of Electrolyzing Salts. Thomas Craney, Bay City, Mich.

498,770. Electrolytic Apparatus. Thomas Craney, Bay City, Mich.

498,771. Electrolytic Cell. Thomas Craney, Bay City, Mich.

498,776. Clamp for Electric Conductors. Axel H. Englund, Chicago, Ill.

498,799 Rheostat. Edward R. Knowles, Middletown, Conn.

498,808. Telephone Switchboard Annunciator. Frank R. McBerty, Downer's Grove, Ill.

498,852. Closed Conduit for Electric Railways. Charles J. Kintner, New York, N. Y.

498,865. Railway Signal. Joseph B. Stewart, Haverstraw, and William G. Wattson, Tappan, N. Y.

498,871. Electrical Transmitter for Telemeter Systems. Charles W. Ayton, New York, N. Y.

498,878. Electric Illuminating Apparatus. Edward A. Colby, Newark, N. J.

498,879. Method of Electric Illumination. Edward A. Colby, Newark, N. J.

The method consists in placing within a vacuum chamber a closed coil of conducting material adapted to become incandescent upon the passage of an electric current through the same, the filament thus formed being brought within the influence of a magnetic field of varying strength, such as may be produced by the passage of an alternating current through a coil of wire. The device shown comprises a hollow cylindrical glass receiver exhausted of air and provided with a closed coil composed of carbon or like material, while within the core of the cylinder is placed a coil of wire encircling a mass of magnetic material; the coil being traversed by an alternating current causes an induced current in the filament with the consequent incandescence of the filament.

498,880. Electrical Switch. James Des Brisay, New York, N. Y.

498,901. Incandescent Electric Lamp. Alexander de Lodyguine, Paris, France.

The lamp is provided with leading-in wires of iron, steel, or other of the baser metals, which are hermetically sealed into the glass bulb of the lamp by a glass seal containing compounds of boron

498,906. Conduit Railway Trolley. Michael H. Smith, Halifax, Eng.

498,907. Electrical Condenser. William Stanley, Jr., and William B. Tobey, Pittsfield, Mass.

498,911. Copying Telegraphic Apparatus. Sylvester P. Denison, Belleville, N. J.

498,915. Electrode for Electric Arc Lamps. Salomon Heimann, New York, N. Y.

The electrode comprises a carbon pencil provided with a refractory coating composed or a mixture of calcined soapstone, water glass, oil and lamp-black. These materials are ground together and then mixed with water, after which the carbon pencils are dipped into the mixture until a coating about one sixty-fourth of an inch thick is formed thereon.

498,919 Telephone. Barton Pickering, Dayton, O.

498,929. Electric Glow Lamp. Edward A. Colby, Newark, N. J.

The receiver is of glass in the form of a hollow cylinder of annular cross section, the filament being in the form of a closed coil. Within the hollow portion of the cylinder is placed a core of magnetic material carrying upon its end the primary coil adapted to be traversed by an alternating current.

498,932. Trolley Stand. James R. Griffiths, Chicago, Ill.

The trolley pole is provided at its lower end with a segmental gear wheel that engages with a rack occupying a horizontal position. Motion of the rack in either direction acts to place tension upon a coiled spring, thereby furnishing the resiliency that maintains the trolley wheel yieldingly in contact with the trolley wire.

498,933. Electric Railway Trolley. James R. Griffiths, Chicago, Ill.

498,969. Dynamo-electric Machine. William S. F. Dillon, Chicago, Ill.

The frame of the machine is cast so that the cores of the electro-magnets are hollow. They are afterward filled with iron filings and the like, thereby greatly cheapening the construction of the machine.

498,973. Method of and Apparatus for Electric Perforating. Dexter M. Garnett, Evanston, Ill., and John H. Garnett, Chicago, Ill.

498,988. Electric Signal and Protective System. Charles E. Ongley, New York, N. Y.

499,003. Electrical Call Box. Walter F. Banks, Milford, Conn.

499,062. Electric Time Signal. Gerhard W. Van Vianen, Cologne, Germany.

499,095. Trolley Wire Finder. James Chase, Rochester, N. Y.

499,097. Electric Illuminating Apparatus. Edward A. Colby, Newark, N. J.

The glass receiver is in the form of a hollow ring, the filament occupying a central position within the receiver, thus forming a ring filament. The ring is placed upon a magnetic core which is encircled by a coil of wire traversed by an alternating current, the ring filament thus acting as the secondary of a transformer. The passage of the current causes the filament to become incandescent. When desired the filament may be caused to glow only at particular sections by making a portion of the filament of material having a high resistance and the remainder of low resistance. As many of the ring-shaped receivers as may be desired may be placed upon a common core, thereby varying the brilliancy of the lamp.

499,099. Electro-dynamic Machine. Olof Dahl, Paterson, N. J.

499,108. Telephone. Edward M. Harrison, Fort Smith, Ark.

499,112. Overhead Electric Railway. John C. Henry, New York, N. Y.

499,115. Electro-railway Trolley. George W. Hooper, Rochester, N. Y.

499,125. Electric Signal Apparatus and System. Jacob W. Lattig, Easton, Pa.

McLEAN & SCHMITT,

Room 416, - 197 S. Canal St., Chicago.

THE "CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

TRADE MARK.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

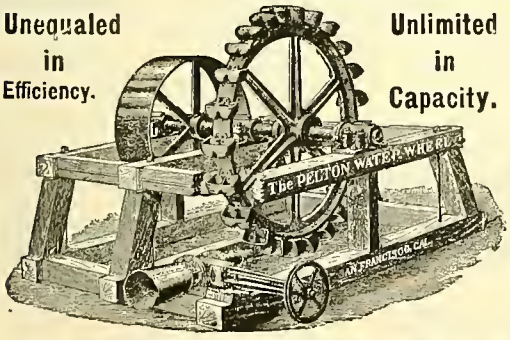
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,000 in use.

Unequaled in Efficiency.



Unlimited in Capacity.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 10 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other Wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

UPRIGHT AND HORIZONTAL SHAFTS.

It is SPECIALLY DESIGNED and ADAPTED for driving

ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT
OF
DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is re-written and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Redding Electric Co.,

336 CONGRESS ST.,

Boston, Mass.

WE DESIRE TO ANNOUNCE that we have added to our business a department of

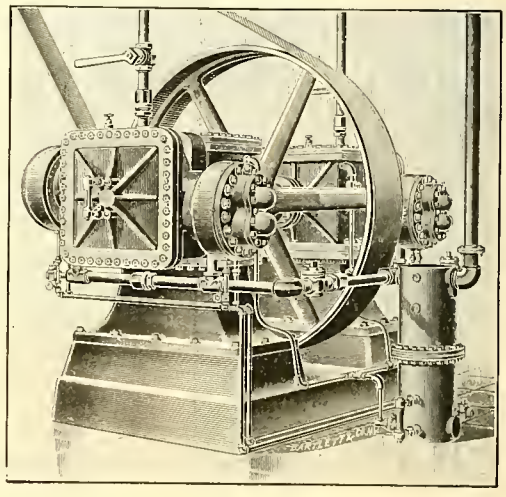
Ice Making and Refrigeration

in which field we recognize a demand for as high-class Engineering as we have been accustomed to give to the construction of Steam Power Plants. This department is distinct in its organization, with headquarters at our Boston Office, 620 Atlantic Avenue, under the immediate management of Mr. Church, with Frederick E. Murphy in executive authority as Engineer in charge.

After an investigation covering a period of two years, and conducted in the interests of our own proposed investment, we have acquired control, by Exclusive License, of the Compressor and Condenser patented by Messrs. Hodges and Havenstrite, of Boston. Staking our reputation as judges of successful machinery, we offer them as the most mechanical, adaptable and economical apparatus for the purpose, thus far placed on the market.

The proportioning and construction of the distribution system, on which the successful working of both Ice-making and Refrigerating plants so largely depends, will be carried out consistently with the reputation for good engineering and good work which we enjoy.

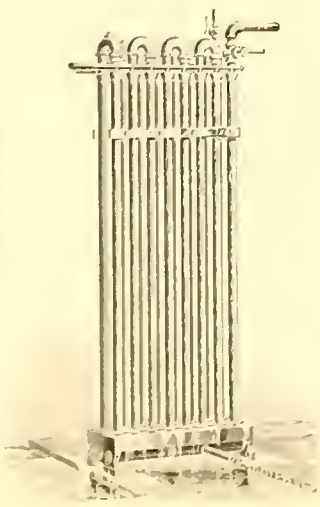
We are now prepared to contract for Plants for the manufacture of



ARTIFICIAL ICE

having any capacity from one-half ton to one hundred tons per day and upward. Artificial Ice has come to stay, equally for sanitary and economic reasons, and its manufacture is a stable and profitable enterprise, competing successfully against the natural product.

ARTIFICIAL REFRIGERATION



will receive our especial attention. In cold Storage Warehouses, Breweries, Packing Houses, and similar large Industries, it is already an established necessity. Into this class of plants we bring for the first time the manifest advantages of small space and headroom, and the subdivision of units, which last is the only means whereby a Refrigerating Plant can meet the fluctuations of the seasons with anything like uniform efficiency.

Refrigeration or combined Refrigeration and Ice-making, in small plants from one-half ton to ten tons per day, is now cheap and practicable, and this particular trade will be fully developed by us in its application to Markets, Creameries, Hotels, Apartment Houses, Hospitals, and Manufacturing processes of all kinds. In this latter field, we believe ourselves without successful competition.

Correspondence regarding any application of Artificial Cold will be to the mutual advantage of our customers and ourselves.

Very respectfully,

WESTINGHOUSE, CHURCH, KERR & CO.,

ENGINEERS,

NOTICE.

Central Station Managers, Municipal Officers, Owners of Isolated Lighting Plants and Prospective Purchasers everywhere are invited to inspect and investigate the **STANDARD SYSTEM** before contracting for apparatus.

For lighting stores, foundries, factories or the streets of a city, this system has no equal.

Our contract does not obligate the purchaser to buy apparatus or supplies exclusively of us for a term of years, but courts open competition and encourages fair tests for merit between any and all existing arc lighting systems and the STANDARD.

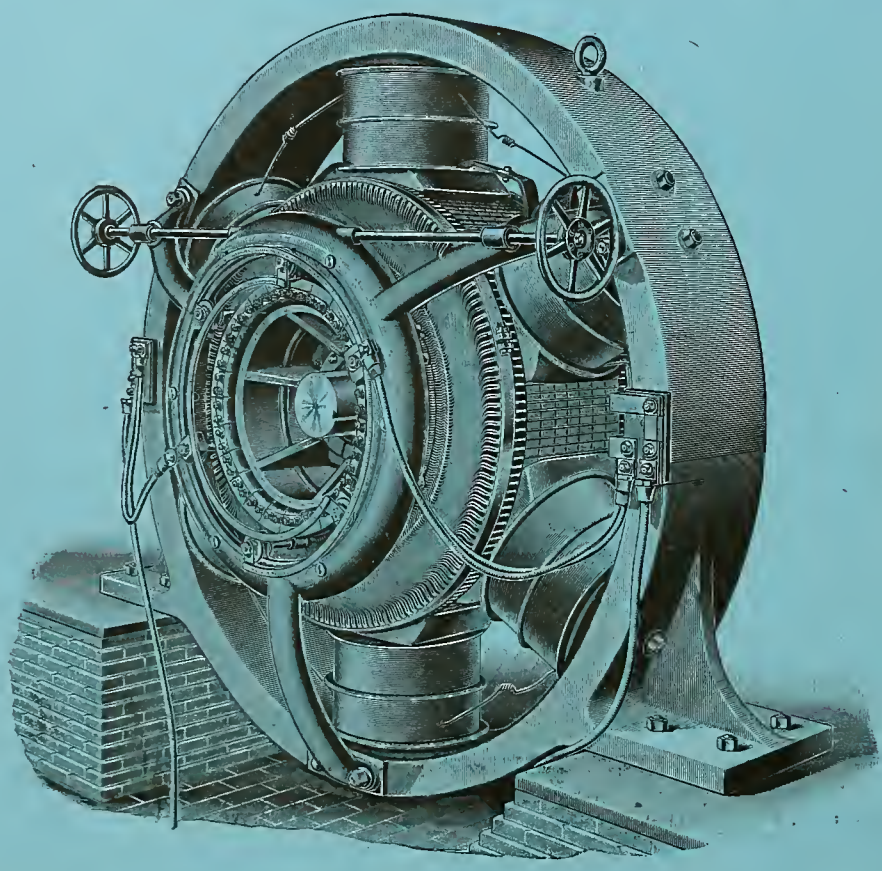
DIRECT-CONNECTED

MULTIPOLAR GENERATORS

FOR LIGHT OR POWER.



Efficient. Economical.

ELECTRICALLY AND MECHANICALLY PERFECT.

These Generators have been designed for use in stations situated in populous centers, where real estate is costly, and restricted space a necessity. By their use the full economy of steam is realized, the expense of belts and counter-shafting and loss by friction eliminated, and attention is reduced to a minimum.

These Generators have been installed in electrical stations in New York, Boston, Brooklyn, and in many of the other large cities in the United States, in each case not only fully meeting, but even exceeding requirements. They are to-day the highest development of dynamo construction.

STREET LIGHTING FROM ALTERNATING CURRENT DYNAMOS.

New Prices given on Lamps, Street Fixtures, Bank Boards, Series Sockets, Poles, Meters

And all accessories for the use of SERIES LAMPS on ALTERNATING CURRENT DYNAMOS.

This system permits a PROFITABLE and SATISFACTORY method of street illumination and should be investigated by every plant using alternating current apparatus. WRITE FOR FURTHER PARTICULARS AND PRICES.

OUR SERIES LAMPS

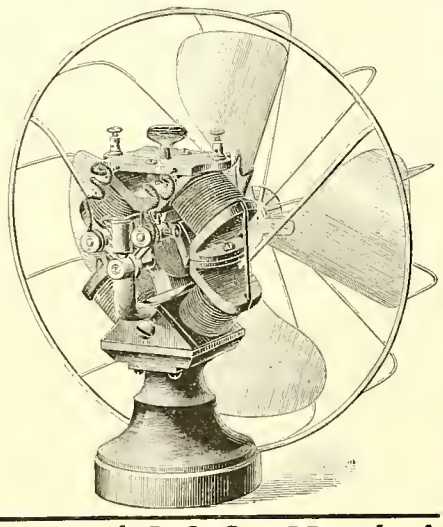
Will show you a COMPARATIVE SAVING equal to their FIRST COST in POWER CONSUMED.

BERNSTEIN ELECTRIC COMPANY, 620 Atlantic Ave., Boston, Mass.

THE ATLANTIC FAN MO OR—1893.

With 10-inch Fan, Fan-guard and Switch.

The Latest Fan Motor.
Novel and Original Construction.
Unequaled by any Fan Motor.
Made for Battery Current, 4 Volts.



ATLANTIC PRIMARY BATTERY,

India Rubber Cells.
6½ x 7 x 8 Inches High.

The best and most economical Battery for running Fan Motors, sewing and dental machines, phonographs, etc. It is neat, compact and efficient.

Weston Standard Portable Direct Reading Voltmeter for ALTERNATING and DIRECT Current Circuits, (1-2 Size.)

These instruments are the only portable direct reading standards for alternating current Circuits worthy of the name. We make them in ranges from 7.5 volts upward to 3000 volts over the whole scale.

The Weston Standard Portable Direct Current Voltmeters and Ammeters are used in all parts of the civilized world.

They are recognized by all authorities as the very best instrument ever produced.

During the past year MR. WESTON has given much time to the further study and improvement of these instruments, and has brought them to a higher degree of permanency, durability, accuracy and excellence than we ever thought possible. *The New Model* is the same in external appearance as the old, but is vastly superior to the latter in all that contributes to a first-class instrument. It is the *acme* of perfection, and is destined to *become* and *remain*

The Standard Portable Instrument of the World.

We have perfected a larger model of these instruments—expressly adapted for use as *absolute standards* in stations and laboratories.

Weston Portable Alternating Current Voltmeters.

These instruments are absolutely permanent and very accurate, and are incomparably superior to any form of hot wire instrument known. They will be found invaluable in securing and maintaining uniformity and economy of operation of alternating current plants.

We make multipliers for use with these instruments to extend their range so as to measure the highest voltage met with on primary circuits.

We also make sixteen different ranges of moderate priced, high grade

Dead-Beat Switch-board Ammeters.

The capacity ranges from 25 amperes to 750 amperes. These instruments are a new type, and are very accurate and well made. The scales are very regular, the instruments very sensitive, tho oughly durable and absolutely permanent, and their indications are not sensibly affected by the most powerful external fields.

In addition, we are making a full line of Direct Current

Station and Isolated Plant Voltmeters,

in three sizes and many ranges. These instruments are very dead beat, and embody many new and valuable features.

They are specially adapted for railway and power plants, and are well suited for arc and incandescent light circuits, and all other work requiring ***good and thoroughly trustworthy Voltmeters.*** They are specially designed for switch board use.

We are also making a large line of high grade

STATION AMMETERS,

in ranges from 200 to 5,000 amperes, with absolutely proportional scales throughout the entire range. The sensibility and accuracy of these instruments have never been approached. A 1,200 ampere instrument will indicate, with full load or no load, the turning on or off of a single lamp, and can be read in any part of the scale to one ampere. They are very dead-beat, handsome in design and finish, permanent, durable and well made, and moderate in price.

See our elaborate exhibit at World's Fair, S. E. corner second floor, Electricity Building, where our representative will be pleased to receive visitors.

Vol. XII. CHICAGO, JUNE 24, 1893. No. 25

Electricity at the World's Fair.

Much interest has been manifested among the exhibitors in the electricity building over the controversy that has been in progress since the Westinghouse Electric & Manufacturing company began work for its large electric sign on the inside of the southern wall of the building. The opposition to the Westinghouse design came principally from the exposition representatives of the General Electric company. Up to the time that the big wall space at the southern end of the building was turned over to the Westinghouse people the General Electric company's tower of light was unquestionably the most conspicuous feature of the interior of the building. But inasmuch as the Westinghouse wall decoration takes up a semi-circular space 102 feet wide and 64 feet high and is visible from all portions of the building, with a head of Columbus 18 feet high, surrounded by an inscription in four-foot letters, the whole thickly studded with incandescent lamps, it may be easily imagined that it is in a position to challenge the question of prominence with any other feature of the building. This fact was quickly recognized by the representatives of the General Electric company, who immediately entered an emphatic protest, asserting that the design was wholly inartistic, amounting to nothing less than a disfigurement of the building, and totally out of place. These gentlemen also pointed out that although their tower of light occupied the most central position in the building they had carefully refrained from putting any sign or lettering on it, even as much as the name of Edison. To this the Westinghouse company rejoined that expositions were primarily for advertising purposes; that it had expended a large sum of money in connection with the electrical features of the fair and was entitled to as large a return in advertising as possible; that the design was not inartistic; that the wall space was assigned to it in the regular way and that, within reasonable bounds, it was entitled to make such display thereon as it saw fit. The General Electric company pressed the point, however, and endeavored to secure the removal of the lettering and lamps by all the means in its power. Chief Barrett held that the assignment was regularly made and could not be rescinded for the reason assigned. The General company carried the matter to Mr. Burnham, the director of works, who, after consultation with the exposition artists, held that the Westinghouse decoration was not in harmony with the embellishments of the building and was also an infringement of the prerogatives of the construction department as interfering with the general decorative scheme of the building. He ordered the sign removed. Chief Barrett, however, considered that Mr. Burnham had no jurisdiction in the premises, and the order was not carried out. In the meantime a petition was circulated among the exhibitors in the building praying for the removal of the sign, but it received few signatures and had no effect. The dispute was then taken before President Higinbotham, who sided with the Westinghouse company, saying that that company had rendered material service to the exposition and was entitled to all due consideration. Finally the council of administration took up the question and settled it a few days ago by deciding that the sign should remain in place. It may be added that the Westinghouse company was one of the last to commence work on its exhibit in electricity building and that, prior to that time, the space had been offered to several other companies, including the General Electric.

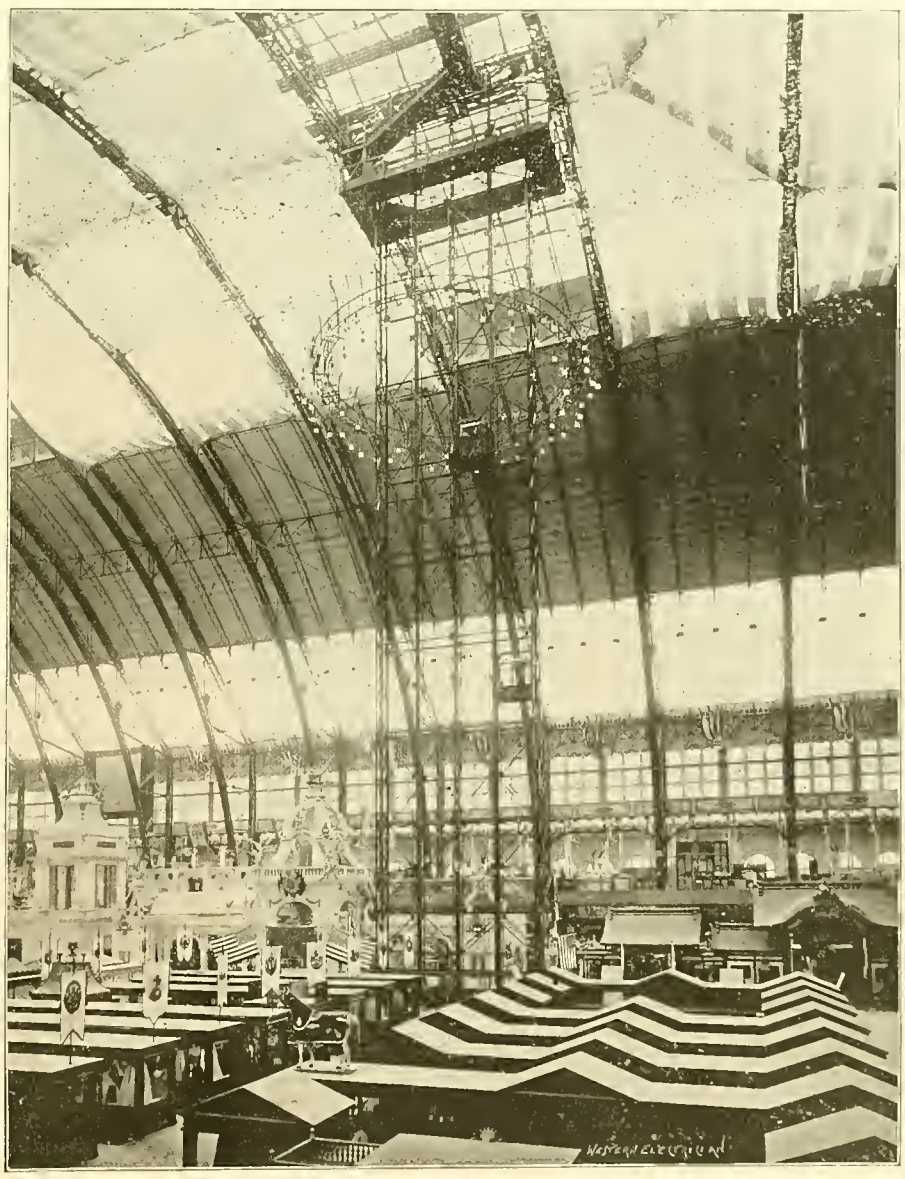

FIG. 1. ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC ELEVATORS RISING TO A HEIGHT OF 200 FEET, MANUFACTURES BUILDING.

It is believed that the elevators illustrated in Fig. 1 are operated to a greater height than any others in the world supplied with electric power. If this is correct, and there seems no reason to doubt the accuracy of the assertion, the World's Fair adds to its list of superlative things one more in the shape of the highest-going electric elevators in the world, for the picture is a representation of a familiar feature of the great manufactures building at the exposition.

These elevators are employed to carry passengers from the floor of the building to the roof promenade above, which is a popular resort, and the distance to the landing under the great trusses supporting the roof is almost exactly 200 feet. There are four elevators, arranged in two sets, each elevator balancing one other by a continuous steel rope running over a drum above. The advantage of this arrangement is obvious, as if the weight of the loaded car going down is equal to that of the one going up, only current sufficient to overcome the friction need be supplied to the motors operating the driving drums. As a matter of fact only about four horse power is expended to hoist a loaded car to the top and bring its fellow down, and the average load on each car is from 2,000 to 2,500 pounds. The elevators are geared to run at the rate of about 200 feet a minute.

The electrical and mechanical equipment is contained in a basement room directly underneath the elevators, and a view of the mechanism operating one set of cars is shown in Fig. 2. Power is furnished by a 15 horse power, compound wound Eickemeyer motor supplied with current of 500 volts potential by mains from machinery hall. The armature shaft of the motor is supplied with a worm gearing, which meshes into a spur gear, which, in turn, is geared to the driving drum. The power is controlled by devices similar in operation to those employed in all electric elevators. When the man in charge of the car throws over the lever at starting a solenoid is released, which, by its movement, gradually cuts out the resistance and starts the motor. In stopping the process is reversed. An automatic device is provided by which the main circuit is opened in case of an accident to the shunt field, thus preventing the machine from burning out. An automatic cut-out will also be used to close the main switch in case the current from the power house should be shut off, thus protecting the machines when current is turned on again.

So far these elevators have worked very smoothly and without an accident, carrying from three to four thousand persons daily without a stop or hitch of any kind. As Fig. 1 shows, the shafts are of open iron work, and rising, as they do, from the center of the floor to a great height, many persons are nervous on making the first ascent. Those who have tried both describe the sensation as not unlike that of a balloon ascension. However, there is absolutely no ground for apprehension, as the construction is of the strongest throughout, and every precaution is taken to insure safety. The elevators were installed by the Hale Elevator company of Chicago, the electrical work being in charge of V. J. Gibson, while Peter O'Brien had charge of the mechanical construction—a

task of no mean proportions, as can be readily imagined. The same company will install electric elevators of similar type, to travel about the same distance, at Niagara Falls.

The electric launch service, under the direction of Admiral Barney, continues to give very general satisfaction to the public. On Tuesday of last week 43 boats were in service and the day's receipts amounted to $3,800. During the busiest season probably $5 000 a day will be earned by the boats. The Priocess Eulalia enjoyed several rides on the electric launches during her visit to the World's Fair and appeared greatly pleased.

The average nightly load on the Westinghouse incandescent plant in machinery hall is now 40,000 lamps on evenings when the fair is open. Nine of the big 10,000 light machines have now been operated under load. Some trouble has been experienced with the steam connections of the engines, so that the entire plant is not quite complete. A handsome iron railing has been erected about the space forming the incandescent lighting station. The operating staff is now fully organized and working smoothly. The men are divided into three shifts, each working eight hours. The lightest load is from 4 to 8 A. M., when current is supplied to about 5,000 lamps. The Westinghouse 700 horse power generator for power service is now being set up in machinery hall.

Attached to the big 1,000 horse power Buckeye engine, belted to one of the Westinghouse dynamos in machinery hall, is a model about a foot long. The little engine is an exact reproduction of the big one and is driven by compressed air. It attracts much attention.

Workmen were engaged last week in placing slag on the decks of the electric fountains about the spouts. This is in accordance with the idea of Luther Stieringer, the designer, who is now in the East.

Chief Barrett has appointed Frank G. Mason, superintendent of the Brooklyn police telegraph department, first honorary assistant of the department of electricity, World's Fair. Elliott Smith, superintendent of fire alarms, New York, and Morris Mead, city electrician of Pittsburg, have been honored in a similar manner.

Several complaints have been made of the theft of small articles in the electricity building, and so the following special notice to exhibitors, issued by Chief Barrett, is timely and important:

Exhibitors in this department will kindly impress upon their attendants the necessity of locking all desks, drawers and show cases at their exhibit spaces before leaving the building at night. Complaints have come to the department from the guard that several exhibitors have been careless in putting away small articles at night. While the guard is very efficient exhibitors will see the necessity to co-operate with it for the protection of exhibits.

The electric air compressor illustrated in Fig. 3 is an exhibit of the Westinghouse company in the electricity building. It is a queer-looking machine and is intended to furnish compressed air for use in mines or other places where electric power is available. In the present instance it will operate two Ingersoll & Sargent rock drills. The motor is of 50 horse power capacity, four pole and shunt wound for a direct current of 500 volts. The fields are supported by a solid circular casting attached to the bedplate while the armature is supported by overhanging bearings. The power from the motor is transmitted to the compressor, which is of the usual type, by gearing, in the manner illustrated in the cut.

R. W. H. Hofstede-Crull, the Dutch electrical engineer who is assistant to E. J. Spencer and in direct charge of the mining and pumping macinery in the General Electric company's exhibit in electricity building, was recently made the victim of a serious assault. Mr. Hofstede, who has long been connected with the Thomson-Houston International company, has acted as paymaster for the General Electric company's men at the fair, disbursing about $15,000 a month, and, as no provision has been made for the safe keeping of money over night in the electricity building, he has frequently been obliged to carry considerable sums on his person. This fact appears to have come to the knowledge of some desperate characters, and, as Mr. Hofstede was returning home late on Saturday night, June 3d, he was set upon by four footpads on Forty-seventh street, near Vincennes avenue. One of the men had a revolver, which he thrust in Mr. Hofstede's face, at the same time demanding that he throw up his hands and keep quiet. The muscular young Hollander did not propose to be robbed without a struggle, however, and he grappled with his principal assailant and succeeded in turning the revolver against him, but could not discharge the weapon. The other men were not idle in the meantime and a fierce struggle ensued at unequal odds during which Mr. Hofstede was so severely beaten over the head with a brick that a thick cap was probably the only thing that saved his life. He made a brave fight but was finally forced to the ground, when he raised a cry for help. His outcry was speedily hushed, however, by the grip of one of the highwaymen's fingers on his throat and he was strangled into unconsciousness. When he regained his senses he discovered that $165 in money and a valuable watch and chain had been taken from him. Fortunately the robbers overlooked, in their haste, one pocket which contained a considerable sum. The robbery was reported to the police but the perpetrators are still at large.

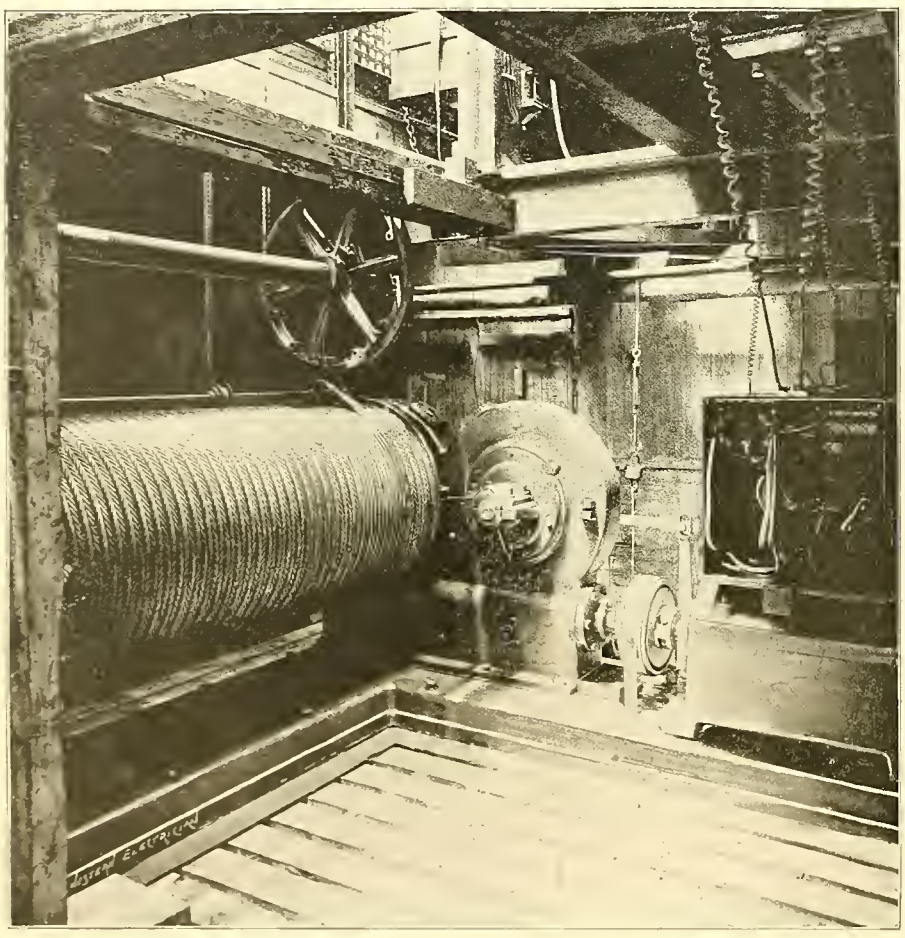

FIG. 2 ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC ELEVATOR PLANT, MANUFACTURES BUILDING.

That switches, fuse blocks and other insulating devices of porcelain are capable of lending themselves to graceful designs is conclusively demonstrated by the display made by the Bryant Electric company of Bridgeport, Conn., Fig. 4, which manages to make a striking exhibit in a small space in the southeastern corner of the electricity building. On a dark background, the lines made by the white porcelain can be seen for a considerable distance, and visitors are usually surprised, on drawing near, to find that the pretty design is made of prosaic switches. The exhibit was designed and constructed by E. R. and T. G. Grier.

The electric scenic theater which is now open to visitors on the Midway Plaisance is the same one which was exhibited by Siemens & Halske at the Frankfort electrical exhibition of 1891 and which excited much attention. At Chicago the spectacle is in charge of Arthur Schwarz, who has a concession by which he is permitted to charge visitors a small fee for the privilege of witnessing the beautiful effects produced. The spectator is ushered into an audience room shut out from the daylight but lighted from a handsome electrolier. The objects of interest are a miniature stage in front of the spectators, who are seated in comfortable chairs, and the regulating mechanism by which the operator manipulates the light. Presently the lights are turned off and all eyes are directed toward the little stage. The curtain is raised but at first nothing is visible. Then a point of red light is seen, which gradually increases in volume until the spectator becomes aware that it is the peak of a lofty mountain kissed by the first rosy flush of the morning sun. As the sun rises the light becomes stronger and gradually loses its ruddy tinge until the whole scene is bathed in the light of day. It can then be seen that a valley in the Alps is represented, with towering peaks and a mountain torrent in the foreground surrounded by lofty crags, amid which is perched a picturesque Swiss chalet. As the spectator is admiring the landscape it grows darker; evidently the sky is overcast with clouds. A storm rapidly comes up, with sheets of lightning and the rumbling of thunder. It is of short duration, however, and presently the sky is clear again. But the day is drawing to a close and soon the failing light and brilliant hues of sunset signalize the departure of the orb of day. But darkness is not long triumphant, for presently the moon rises, and, in its journey from the horizon to the zenith, amid a field of twinkling stars, casts a clear bluish-white light over all. This is the last scene, and the disappearance of the moon is the signal for a falling curtain and the relighting of the auditorium. About fifteen minutes elapses in the "day" that is presented to the spectator. The various effects are very pretty and they elicit general praise.

The mechanical apparatus is not particularly complicated. The light is produced by a large number of 5 candle power lamps, red, white and blue in color and arranged alternately. Each color and each locality in the setting is wired on a separate circuit, so that, by the introduction of resistance, it only becomes a question of skillful manipulation to give light of any shade or intensity desired. Of course none of the lamps are visible, as they are arranged in the footlights and wings as well as overhead and behind the setting. The motion of the moon is produced by a tiny motor. Current of 150 volts pressure is used, obtained from a 500 volt circuit from machinery hall and transformed down.

In general the exhibits in electricity building well befit their location and contribute to the success of the electrical display. Exception should be made, however, in the case of the French musical instruments shown in the northwestern gallery. These are entirely out of place and should have been placed in the musical section of the manufactures building. The incongruity of thrusting this exhibit in the electricity building is marked, and while not the fault of the department of electricity or the exhibitor in question it excites remark from visitors. The exhibit includes a number of mechanically operated pianos and several gaudy orchestrions. The latter are "played" by two sturdy French girls by the simple process of turning a crank, and the sounds produced are so harsh and loud that near by exhibitors are anxiously casting about for some means of relief.

On Monday the council of administration took action that will be received with rejoicing by every electrical exhibitor at Jackson Park. This was an order throwing open the grounds to the public on every evening until 11 P. M. The buildings are to be open until ten o'clock, and the order went into effect on Wednesday. The order in full is as follows:

The council having for some time had under considera-

tion the question of keeping the exposition open on every evening, and having ascertained from practical tests that the public desires to be accommodated in this behalf, and the council recognizing its duty to respond to the public demand, it is

Ordered, that on and after June 21, 1893, until otherwise ordered by this council, the exposition grounds shall be open to the public on every evening until 11 P. M. and that the exposition buildings shall be kept open until ten o'clock. It will be expected that visitors will promptly leave the exposition buildings at ten o'clock, and also promptly leave the exposition grounds at eleven o'clock; and in order to facilitate their exit from the grounds it is

Ordered, that promptly at eleven o'clock on each evening the wagon gates at the several exits shall be opened for purposes of exits; and it is further

Ordered, that while the exposition will be open as herein provided for on every evening of the week, Tuesday, Thursday and Saturday evenings shall be nevertheless regarded as special evenings, and characterized by special features of attraction and entertainment.

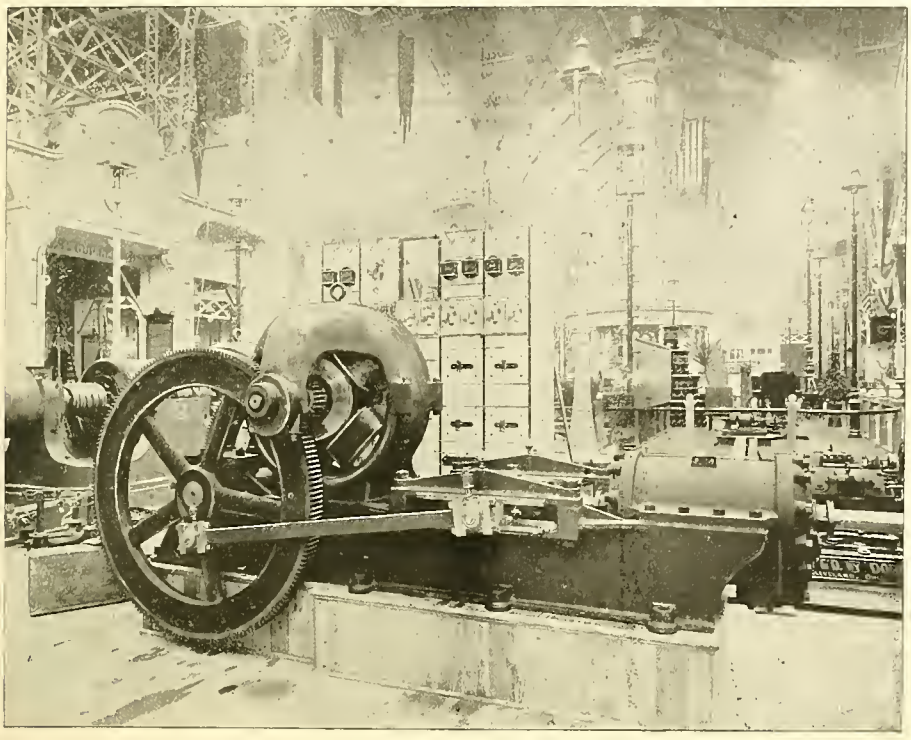

FIG. 3. ELECTRICITY AT THE WORLD'S FAIR.—ELECTRIC AIR COMPRESSOR, ELECTRICITY BUILDING.

Street Railway Controversy in San Francisco.

San Francisco, not to be outdone by the older cities of the country in the matter of unreasonableness in its estimation of trolley circuits for street railway use, is now engaged in the throes of a bitter controversy, that has at this early stage reached the courts.

The first act in this drama occurred on May 29th at midnight, when the Omnibus Cable company, which has recently secured controlling interest in the North Beach & Mission Railway company, appeared on Market street, San Francisco's principal thoroughfare, with an army of men, estimated by the *San Francisco Chronicle* as reaching 2,000. Immediately following appeared scores of trucks loaded with shovels, barrels of concrete, electric trolley poles, immense reels of wire, hangers, cross-wires, etc., and all other paraphernalia necessary for the complete equipment of a trolley system.

The army started to work and in a short time the men were digging holes along the curbs and planting poles. After about two hours' work, Mayor Ellert appeared upon the scene and commanded that the work should cease, maintaining that the company had no franchise granting it the privilege of placing trolley circuits upon Market street. To this request the Omnibus people, through their attorneys, Wood & Herrin, complied; the work ceased and the army was disbanded, but twenty or so railway poles stood as a monument of the midnight adventure. In these, however, Mayor Ellert recognized a vantage point that he did not propose, as the chief executive of the city, to tolerate; consequently the street department was called to the rescue, a derrick was rigged up and the poles were pulled out of their holes and carted to the corporation yard.

San Francisco papers were filled with accounts of how the rights of the city were being trampled upon by private corporations. The legality of the action was maintained by the attorneys of the Omnibus Cable company, and the city authorities were equally strong in maintaining that the attempt to place poles on Market street was unwarranted. The mayor's action was warmly endorsed by the papers, but, regardless of conflicting opinions, the Omnibus Cable company has brought suit against the mayor, the chief of police and the superintendent of streets, in the Superior Court, to enjoin the city officials from interfering with the erection of the trolley system.

Until the recent consolidation of the Omnibus Cable company and the N. B & M. Railway company, there was no continuous franchise for a street car line on Market street from Eighth street to the ferries, other than that owned and occupied by the Market Street Cable company. On each side of the center tracks occupied by the Market Street Cable company horse car tracks existed over the route named, but the tracks were owned by different companies who jointly occupied them, yet who held different franchises. When the consolidation referred to was effected, the Omnibus Cable company won a continuous line from Eighth street to the ferries, and it was this system that it intended to operate by electricity.

The legal situation appears to be about as follows: At the last session of the Legislature a law was enacted to the effect that franchises which had been granted for street railway privileges prior to the enactment of the law in question would be made to cover electricity as a motive power on an equal footing with horse or cable traction, provided that municipal requirements should be complied with. Since the abrogation of the order of the board of supervisors, prescribing a district in the business center of San Francisco in which the use of overhead trolley circuits should be prohibited, there has been no municipal enactment restricting the use of the trolley system in the city; and it is believed that this point is the principal one upon which the Omnibus Cable company will make its fight.

The law reads, however, that electric railway systems in cities shall be provided with the most modern improved electrical appliances, and the mayor maintains that the trolley system does not constitute the most modern improved electrical appliance. He firmly believes that underground or storage systems are practicable and safe, and that therefore a conformity with the law can only be had through the equipment of either an underground or a storage system.

It was felt during the fight over the attempt to introduce the trolley system on Market street that the subtle hand of the Southern Pacific company, through its principal San Francisco concern, the Market Street Cable company, was at the bottom of the opposition which succeeded in pulling up the poles that the Omnibus Cable company had placed. Mayor Ellert has, however, shown himself to be beyond the influence even of the power of the Southern Pacific company in a subsequent occurrence in which the Market Street Cable company itself was the aggressor, and in which the tactics originally laid out and which failed with the Omnibus Cable company on Market street, were followed almost to the letter.

The Market Street Cable company holds the franchise for the building of an electric road on Seventh street, and on the morning of June 8th laborers appeared on Seventh street and commenced the erection of poles for a trolley road. Poles were placed on Seventh street, between Market and Mission streets, whereupon the laborers moved bag and baggage to Fifth street, and there commenced the erection of poles for the equipment of the Fifth street branch of the Market street system. After a number of poles had been placed, the mayor appeared and not only put a stop to the work, but pulled up the poles the Market Street Cable company had placed, both on Fifth and Seventh streets, and carted them off to the corporation yard, placing

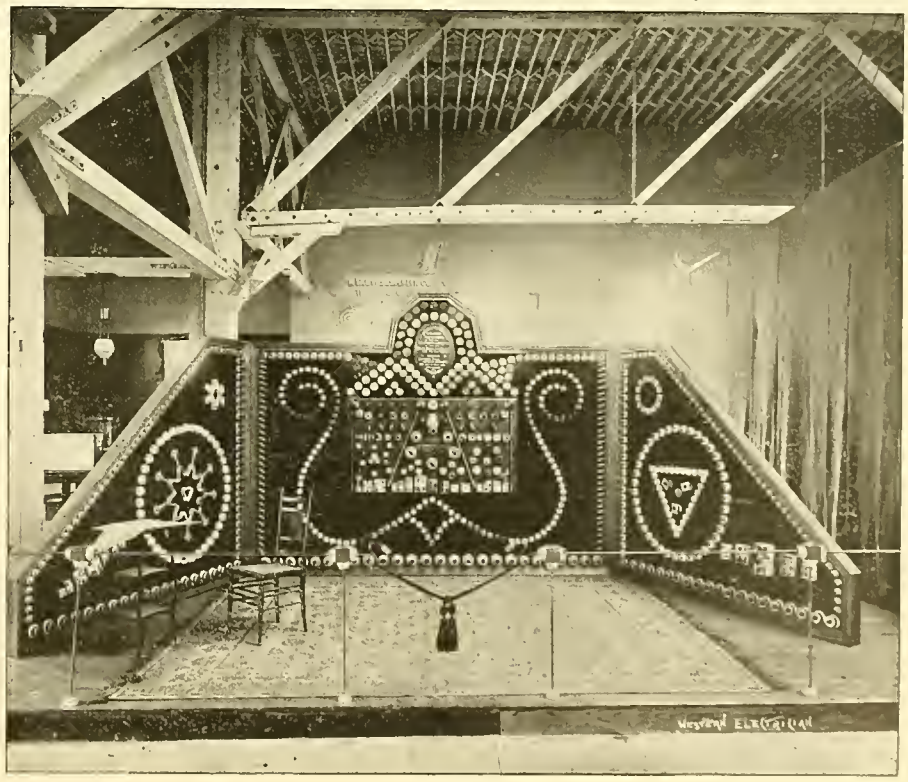

FIG. 4. ELECTRICITY AT THE WORLD'S FAIR.—EXHIBIT OF THE BRYANT ELECTRIC COMPANY, ELECTRICITY BUILDING.

them alongside of those of the most formidable rival of the Market Street Cable company—the Omnibus Cable company. There are, therefore, 22 more poles in the corporation yard than before the last escapade of the Market Street Cable company.

The situation of the Market Street Cable company on Fifth street is precisely identical with that of the Omnibus Cable company on Market street, and the franchise of neither company permits the use of electricity as a motive power, each company working under the recently enacted state law. On Seventh street, however, a franchise for an electric road is held by the Market Street Cable company, but the contention of the mayor is that the clause in the franchise providing for the use of the most modern electrical appliances in the equipment of the road is not complied with in the trolley system.

The suit of the Omnibus Cable company against the city officials is at present pending before Judge Garber of the Superior Court, and there seems to be a general disposition, not only on the part of the railroad companies interested, but also on the part of the municipal officers, to let the decision of the courts settle the matter. The railway people feel that they have an invincible case, and that if the suit is not won in the lower courts, it will certainly be decided in their favor in the upper tribunals.

World's Congress of Electricians.

Prof. H. S. Carhart, secretary of the World's Congress of Electricians, announces the following acceptances of invitations to read papers at the congress:

W. H. Preece, F. R. S., engineer-in-chief, General Postoffice, London. Subject—"Signalling Through Space by Means of Electromagnetic Vibrations."

Professor W. E. Ayrton, F. R. S., City and Guilds of London Institute, Central Institution. Subject—"The Variation of P. D. of the Electric Arc with Current, Thickness of Carbons and Distance Apart."

Professor Mascart of Paris will be present but is obliged to decline to prepare a paper by reason of other engagements. Both the war and navy departments have detailed officers to attend the congress. Professor Ayrton sails from Liverpool June 21st, and expects to be in Chicago by July 1st or 2d.

The question is being agitated at Crowley, La., of putting in an electric light plant to be operated in connection with the waterworks.

Ifaddon & Co., Glasgow, have just completed a new installation of electric light on board the steamship City of Rome. The plant consists of two compound wound dynamos of the Castle type, having an output equal to 500 16-candle power incandescent lamps. The main switchboard is of their own design and manufacture, and is a simple but efficient arrangement whereby, without any possibility of confusion, any division of the lights can be run by either of the machines. The installation is giving every satisfaction, and is said to be a marked advance upon the previous lighting.

New Chicago Office of the Western Union Telegraph Company.

The Western Union Telegraph company has transferred its Chicago main office, operating department and general offices from its old quarters in the Union building at the corner of La Salle and Washington streets to its new building on the corner of Clark and Jackson streets. This building was formerly known as the Phenix building, is absolutely fire proof, and was purchased by the Western Union company last October. From an architectural standpoint the building is one of the very best in Chicago and there are but few better in the country. The additional story, together with the new roof elevation, will add much to the appearance of the property and give it rank as one of Chicago's finest office buildings. In dimensions it is 217 feet long by 50 feet wide, fronting on the three thoroughfares: Clark and Jackson streets and Pacific avenue. The finish of the building is elegantly done in white marble and solid mahogany, every office is well lighted, and five elevators, now being refitted, make the elevator service second to none in the city for rapidity and safety.

For its own use the telegraph company will occupy five floors of the building as follows—the west half of the cellar for its dynamo and terminal rooms; the west half of the first floor, on Pacific avenue and Jackson street, for its receiving, delivery and money order departments, the entire eighth floor for its general offices, the ninth and tenth floors for its operating departments, the attic, or eleventh floor, to be used for dining room, clothing lockers, lavatories, etc.

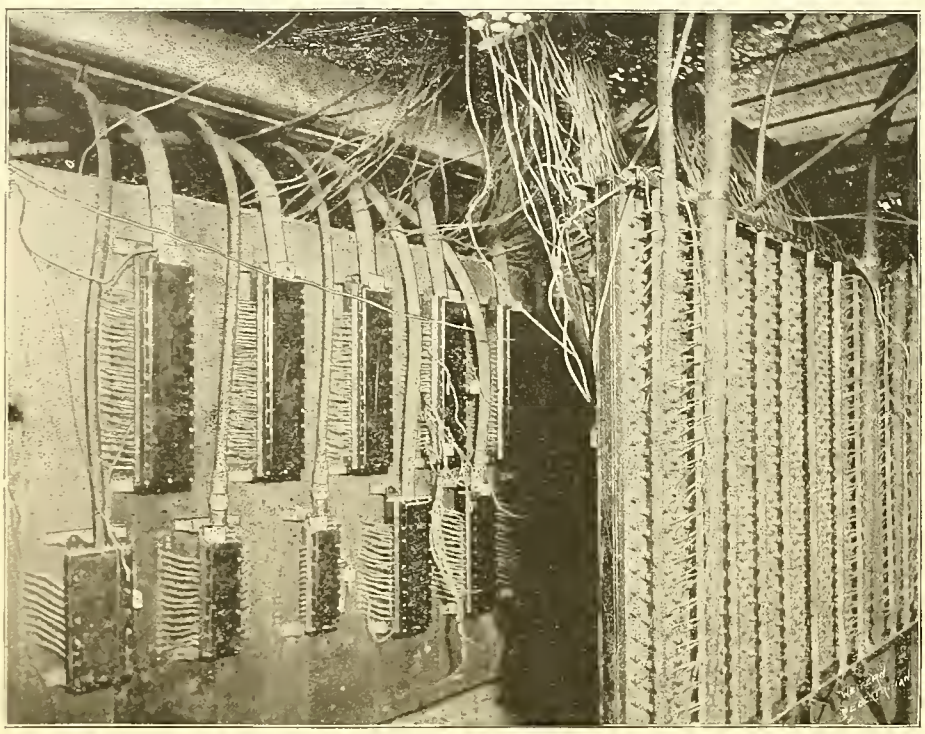

FIG. 2. NEW CHICAGO OFFICE OF THE WESTERN UNION TELEGRAPH COMPANY.—TERMINAL ROOM.

In the dynamo room will be found a first class piece of wire work. There are in all 47 dynamos, two groups of eight each, one reversible group of five, and 26 small dynamos for use as intermediates on short wires. The principal problem was to carry the wires from the dynamos to the dynamo switchboard in the east end of the dynamo room without crossing any two of the leads. This was no easy task when the multitude of wires is taken into consideration but it was finally successfully accomplished. All the negative cables are grouped together on one side of the board and all the positive cables on the other. All the dynamos are of the Edison type, excepting two Crocker-Wheeler dynamos, which have been added to the station since its removal ftom the old building. Weston direct reading voltmeters are also in use. These 47 dynamos generate all the power that is used for transmitting and operating in the building. It would take 33,000 cells to replace their electrical energy. The seven-volt dynamos operate the single wires and repeating sounders, the 25 volt machines supply the duplex and quadruplex local wires, the 45 volt the short city lines, and the 75, 150, 210, 290 and 350 volt, the single, duplex and quadruplex wires, according to length and resistance. The 26 small dynamos are used on city lines. The illustration, Fig. 1, gives a good idea of the dynamo room, the small dynamos being to the left and the switchboard at the extreme end.

Northwest of the dynamo room will be found the terminal room, where may also be seen an admirable arrangement of wires, cables, cable terminals and slate boards, the cables passing from the underground conduit to the terminals, thence to the front of the slate board, and from the rear of thes late board to the twenty-two 100 conductor cables leading to the various switchboards in the operating departments through the 3 inch iron pipes which begin in the terminal room, pass into concrete beds under the massive pumping machinery of the building, and thence upward to the operating room. In the illustration, Fig. 2, the slate board, consisting of two sections of slate, each section possessing 300 binding posts, is shown on the right, overhead and back of which is a conglomerate mass of cables as yet unattached to the terminal heads. On the left is shown some of the terminal heads which are now wired. In this room the wiring is not yet completed and some idea of the extent of the task may be gained by glancing at the loose cables at the top of the picture. When completed there will be 28 cable terminal heads, each box containing 19 to 200 conductors. From the terminal room to the operating room there run in all 25,000 single wires, 14,000 two conductor cables, 20,000 four conductor cables, 3,600 eight conductor cables, 6,100 ten conductor cables and 22 one hundred conductor cables. Day's kerite insulation is used exclusively.

The receiving, money order and delivery department is superb in its mahogany finish and is altogether different from the old style telegraphic counter, the writing desks for patrons being located in the deep recesses of the large windows and arranged for chairs instead of the old style standing desk so long used for the purpose. On the inside of the counter the various departments are divided by a series of polished brass screen cages and present a handsome banking house appearance.

The most interesting room in the building, however, is the ninth floor operating room. This room is 22 feet in height, running the full length of the building, is well lighted on all sides, tile floored, well ventilated and admirably arranged. On the south wall, and east of the elevator shaft, is the eastern switch of five sections with fifty wires to the section. In the same relative position on the west is the western switch with like capacity, and on the tenth floor will be placed the city line switch of three 50 wire sections. In the center of the room, in the large bay window on the north wall, is located what is known as the combination switch, made after the pattern of the one in the New York main office. To this switch is run all of the quadruplex local wires of the office and through it can be connected all of the various branch offices, such as the Board of Trade, Grocery District, etc. Entering at this board are all of the newspaper loops, and running thence to the east and west switches are what may be called flying loops, arranged so that if Denver has a Chicago newspaper special and New York also has one, they are for the time transferred to the combination board and from that point the newspaper is given its connection.

The wire work of the dynamo room was designed by Louis Seibel, wire chief of the Cleveland office; that in the terminal room by J. S. Robinson, foreman of repairs, and that in the operating room by V. T. Kissenger, wire chief of the Chicago office; the whole being under the supervision of C. H. Summers, electrician of the company at Chicago.

The operating departments are fully equipped with the Martin cash carrier system, and there is nothing which will more interest the casual visitor to the great operating department than this system. From the distributing table in the gallery of the ninth floor dropping to the operating level below, running to the floor above, around the corners, on the diagonal, taking angle elevation and decline alike, run the sixteen tracks of this unique little railroad, and hurrying, scurrying hither and thither are the tiny cars in such number and bewilderment that one is at once reminded of a busy railroad switching yard.

An excellent idea is given of the different interesting features of this room in Fig. 3. Here on the ninth floor are operating spaces for 460 machines. In the gallery 92 city lines are in operation, and it is expected that by August the tenth floor operating room will be opened, which will accommodate nearly as many more. Here also will be located the company's corps of bookkeepers and the Wheatstone system of automatic telegraphy. These rooms to the visitor present scenes of continual bustle and confusion, and one cannot but wonder at the acute ear of the operator who can detect the sounding of his own instrument amid the constant and bewildering, clicking of over 640 sounders. The room as

yet is in an unfinished condition and much in the way of decoration and comfort is yet to be provided.

The Chicago office enjoys the distinction of having more complete facilities for the quadruplex system of sending messages than the New York office. One of the novel features noticeable in the operating rooms is the enclosing of the switchboards in plate glass with iron frames. This idea was copied from the New York main office and gives the switchboards a unique and handsome appearance. In all there are 14 switchboards in the building and 3 loop switchboards, each with five rows of jacks.

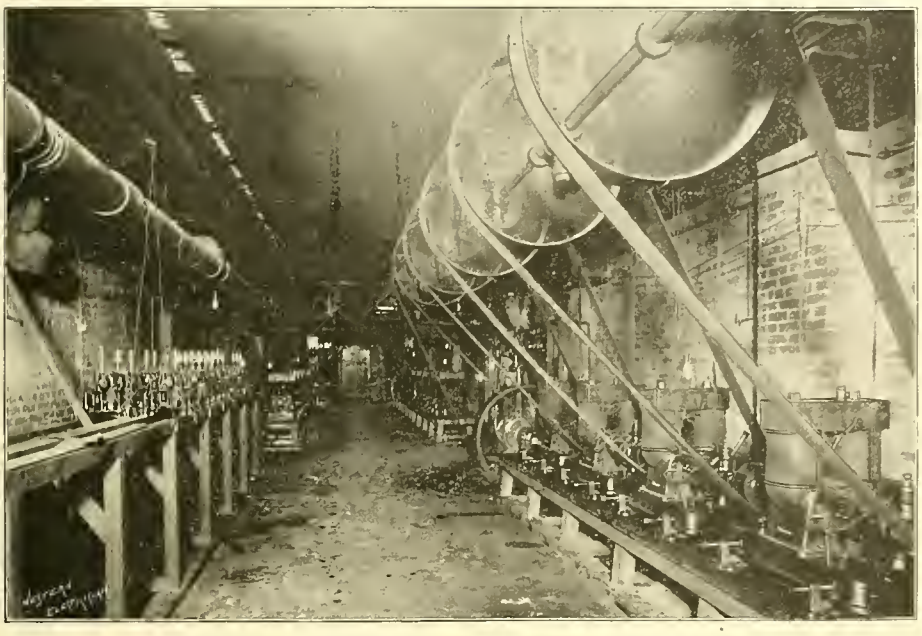

FIG. 1. NEW CHICAGO OFFICE OF THE WESTERN UNION TELEGRAPH COMPANY.—DYNAMO ROOM.

There are in use 2,826 resistance lamps, varying from 20 to 700 ohms. This number has been found to be insufficient, however, and several hundred more are to be added.

For the admirable arrangement of the building and the diminution of time in the transfer of telegrams effected by it, for the general telegraphic equipment, first-class in all respects, and for the handsome receiving room offered to the patrons of the company, Chicago is indebted to the Western Union Telegraph company, in that it now has a telegraph office second to none in the world.

Light and Other High Frequency Phenomena.

By Nikola Tesla.

PART IV.

The effects of resonance are being more and more noted by engineers and are becoming of great importance in the practical operation of apparatus of all kinds with alternating currents. A few general remarks may therefore be made concerning these effects. It is clear that if we succeed in employing the effects of resonance practically in the operation of electric devices the return wire will, as a matter of course, become unnecessary, for the electric vibration may be conveyed with one wire just as well, and sometimes even better than with two. The question first to answer is, then, whether pure resonance effects are producible. Theory and experiment both show that such is impossible in nature, for as the oscillation becomes more and more vigorous the losses in the vibrating bodies and enviroring media rapidly increase and necessarily check the vibration, which otherwise would go on increasing forever. It is a fortunate circumstance that pure resonance is not producible, for if it were there is no telling what dangers might not lie in wait for the innocent experimenter. But to a certain degree resonance is producible, the magnitude of the effects being limited by the imperfect conductivity and imperfect elasticity of the media or, generally stated, by frictional losses. The smaller these losses, the more striking are the effects. The same is the case in mechanical vibration. A stout steel bar may be set in vibration by drops of water falling upon it at proper intervals; and with glass, which is more perfectly elastic, the resonance effect is still more remarkable, for a goblet may be burst by singing into it a note of the proper pitch. The electrical resonance is the more perfectly attained, the smaller the resistance or the impedance of the conducting path and the more perfect the dielectric. In a Leyden jar discharging through a short stranded cable of thin wires these requirements are probably best fulfilled, and the resonance effects are therefore very prominent. Such is not the case with dynamo machines, transformers and their circuits, or with commercial apparatus in general in which the presence of iron cores complicates or renders impossible the action. In regard to Leyden jars with which resonance effects are frequently demonstrated, I would say that the effects observed are often attributed but are seldom due to true resonance, for an error is quite easily made in this respect. This may be undoubtedly demonstrated by the following experiment. Take, for instance, two large insulated metallic plates or spheres which I shall designate A and B, place them at a certain small distance apart and charge them from a fractional or influence machine to a potential so high that just a slight increase of the difference of potential between them will cause the small air or insulating space to break down. This is easily reached by making a few preliminary trials. If now another plate—fastened on an insulating handle and connected by a wire to one of the terminals of a high tension secondary of an induction coil, which is maintained in action by an alternator (preferably high frequency)—is approached to one of the charged bodies A or B, so as to be nearer to either one of them, the discharge will invariably occur between them, at least it will, if the potential of the coil in connection with the plate is sufficiently high. But the explanation of this will soon be found in the fact that the approached plate acts inductively upon the bodies A and B and causes a spark to pass between them. When this spark occurs, the charges, which were previously imparted to these bodies from the influence machine, must needs be lost, since the bodies are brought in electrical connection through the arc formed. Now this arc is formed whether there be resonance or not may now be connected to one of the coatings of the second jar, and when it is brought near to the first jar just previously charged to a high potential from an influence machine, the result is the same as before, and the first jar will discharge through a small air space upon the second being caused to discharge. But both jars and their circuits need not be tuned any closer than a basso profundo is to the note produced by a mosquito, as small sparks will be produced through the air space, or at least the latter will be considerably more strained owing to the setting up of an alternating electromotive force by induction, which takes place when one of the jars begins to discharge. Again another error of a similar nature is quite easily made. If the circuits of the two jars are run parallel and close together, and the experiment has been performed of discharging one by the other, and now a coil of wire be added to one of the circuits whereupon the experiment does not succeed, the conclusion that this is due to the fact that the circuits are now not tuned, would be far from being safe. For the two circuits act as condenser coatings and the addition of the coil to one of them is equivalent to bridging them, at the point where the coil is placed, by a small condenser, and the effect of the latter might be to prevent the spark from jumping through the discharge space by diminishing the alternating electromotive force acting across the same. All these remarks, and many more which might be added but for fear of wandering too far from the subject, are made with the pardonable intention of cautioning the unsuspecting student, who might gain an entirely unwarranted opinion of his skill when seeing every experiment succeed; but they are in no way thrust upon the experienced as novel observations.

In order to make reliable observations, of electric resonance effects it is very desirable, if not necessary, to employ an alternator giving currents which rise and fall harmonically, as in working with make and break currents the observations are not always trustworthy, since many phenomena, which depend on the rate of change, may be produced with frequencies widely different. Even when making such observations with an alternator one is apt to be mistaken. When a circuit is connected to an alternator there are an infinite number of values for capacity and self-induction which, in conjunction, will satisfy the condition of resonance. So there are in mechanics an infinite number of tuning forks which will respond to a note of a certain pitch, or loaded springs which have a definite period of vibration. But the resonance will be most perfectly attained in that case in which the motion is effected with the greatest freedom. Now in mechanics, considering the vibration in the common medium—that is, air—it is of comparatively little importance whether one tuning fork be somewhat larger than another, because the losses in the air are not very considerable. One may of course inclose a tuning fork in an exhausted vessel and by thus reducing the air resistance to a minimum obtain better resonant action. Still the difference would not be very great. But it would make a great difference if the tuning fork were immersed in mercury. In the electrical vibration it is of enormous importance to arrange the conditions so that the vibration is effected with the greatest freedom. The magnitude of the resonance effect depends, under otherwise equal conditions, on the quantity of electricity set in motion or on the strength of the current driven through the circuit. But the circuit opposes the passage of the currents by reason of its impedance,

FIG. 3. NEW CHICAGO OFFICE OF THE WESTERN UNION TELEGRAPH COMPANY.—OPERATING ROOM.

But even if the spark would not be produced, still there is an alternating electromotive force set up between the bodies when the plate is brought near one of them; therefore the approach of the plate, if it does not always actually, will, at any rate, tend, to break down the air space by inductive action. Instead of the spheres or plates A and B we may take the coatings of a Leyden jar with the same result, and in place of the machine, which is a high frequency alternator preferably, because it is more suitable for the experiment and also for the argument, we may take another Leyden jar or battery of jars. When such jars are discharging through a circuit of low resistance the same is traversed by currents of very high frequency. The plate and, therefore, to secure the best action it is necessary to reduce the impedance to a minimum. It is impossible to overcome it entirely, but merely in part, for ohmic resistance cannot be overcome. But when the frequency of the impulses is very great the flow of the current is practically determined by self-induction. Now, self-induction can be overcome by combining it with capacity. If the relation between these is such that at the frequency used they annul each other, that is, have such values as to satisfy the condition of resonance and the greatest quantity of electricity is made to flow through the external circuit, then the best result is obtained. It is simpler and safer

(Continued on page 327).

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, In advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity, or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring Western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

VISITORS

To the World's Fair are requested to forward their addresses to the WESTERN ELECTRICIAN as early as possible or notify us immediately upon their arrival in Chicago.

SAN FRANCISCO, like many other cities that have failed to take advantage of the improvements in rapid transit methods afforded by the trolley system, is now desirous of introducing a modern system of transportation, and the local street railway companies have signified their willingness to equip the existing horse car lines and the proposed extensions. The people favor the electric railway and the companies are willing to improve the service. In fact two of the local companies have attempted to equip their lines but have been stopped by the mayor. That official is opposed to the trolley system and seems anxious to force the companies to experiment with the storage battery and underground systems. This they refuse to do, and the controversy will be settled in the courts. In the meantime San Francisco will be obliged to put up with horse cars.

COMPLAINTS against the trolley system have been based largely upon the number of accidents that have followed the substitution of the electric motor for the horse car. It is true that a large percentage of these accidents are due to the carelessness of the victims, yet the fact remains that some of them are due to the men in charge of the cars. The public holds the company responsible for all accidents no matter how much care has been exercised in the selection and instruction of the men employed. In some cities a regular course of training has been developed by the electric railway companies, and an applicant for a position as motorman is obliged to serve an apprenticeship before taking charge of a car. Inspectors and instructors accompany new men until they are thoroughly capable of handling the cars themselves. It would seem that when such precautions were taken there should be very little cause for complaint but it appears that despite the efforts of the company and the vigilance of the inspectors the men grow careless at times and accidents occur, for which the corporations are held legally responsible. Several actions having been instituted against the street railway company of Minneapolis and St. Paul, President Lowry has determined to make the men assume their share of the responsibility. Accordingly a contract was prepared with this view and submitted to the men. Among the provisions of the contract were these: The men should be responsible not only for breakage to the cars and equipment, but to vehicles broken in collisions and personal injury sustained by passengers when such collisions and accidents were due to the negligence or carelessness of employes. The contract also provided that each employe should place with the company $100 upon beginning work, which amount should be used in paying for any accidents due to the employe's carelessness. This of course did not please the motormen, and on last Sunday morning a strike was ordered. The cars of the entire system were tied up, and the company was informed that they would remain tied up until the contract was rescinded. It is interesting to note the comments of the patrons of the road on this action. Very few recognize the right of the company to protect itself, although they demand first-class service. It is hardly possible that the company could enforce the terms of the agreement, but the incident has furnished another example of the perversity of the general public. Instead of giving the company credit for endeavoring to secure for its patrons improved service and protection against the negligence of irresponsible employes, the public generally allowed its petty inconvenience to count for more than the issue involved. The quickest way to settle the dispute was to support the men and this they did.

IT is with great gratification that the WESTERN ELECTRICIAN announces to the electrical fraternity that the management of the World's Fair has at last seen its way to the opening of the exposition on every evening of the week. The decision was arrived at on Monday of this week, and the full text of the order is printed elsewhere in this issue. This order, of course, nullifies the obnoxious evening closing rule which aroused such a unanimous protest from the men engaged in furthering the electrical industry, as the result of the agitation led by the WESTERN ELECTRICIAN The first gun in this campaign, it will be remembered, was fired by this journal on November 5, 1892, when we said, in a leading editorial:

> If this new regulation be allowed to stand, it will interfere very seriously with the electrical features of the exposition—just the extent, indeed, which separates a brilliant success from a commonplace performance. The electrical men, who are now so enthusiastically supporting the fair and contributing their skill, time and money, will lose heart and have little more than a perfunctory connection with an enterprise in which such a conspicuous disregard of their claims is shown. They have been led to believe that the fair was to be open evenings, and it is unfair and unjust to deprive them, at this late day, of the benefit the exposition would be to them as an object lesson to all the nations of the earth of the latest advances in electric lighting. * * * The electrical industries are alive to the importance of this question and will not rest content until the injustice is righted. Even now a movement is on foot to convince the commission that it has dealt a blow not only to the electrical interests of the United States, but, unwittingly, to the World's Columbian Exposition as well. That this is the case there can be no doubt, and all possible influence must be brought to bear on the commissioners to enable them to see the folly and wrong of their amazing seven o'clock rule.

The position thus taken was cordially indorsed by the electrical fraternity of the country, and the protest was so vigorous and unanimous that on November 26th the WESTERN ELECTRICIAN was enabled to announce that President Higinbotham, in response to a petition forwarded through Col. Clowry, conceded that evening sessions would be held on from three to six days each week. The fight was kept up for some time longer, but no more definite pledge from the World's Fair management could be secured. Shortly after the fair was opened it was announced that the grounds would be open on Tuesday, Thursday and Saturday of each week, and on June 19th the final and complete concession was made.

Never has the electrical fraternity receded from the position that evening opening was demanded by the public, profitable to the Exposition company and only just to the electrical exhibitors, and it is a matter for general congratulation that the correctness of this contention has at last been recognized. It is a notable victory for common sense and justice, and the WESTERN ELECTRICIAN is happy at having done its share to achieve this result.

OUR thanks are due, and are gratefully tendered, to the *Electrical World* of June 17th for its graceful compliment to the WESTERN ELECTRICIAN in the course of a bit of editorial correspondence from Chicago entitled "World's Fair at Short and Long Range." The subject under consideration was the publication of articles in the electrical press on the tower of light in electricity building, and, at the risk of being charged with vanity, we reprint the following paragraph:

> First of all, there is our western contemporary—always enterprising, always alert and bright; it plumes itself upon a genuine scoop, for such it succeeded in making, upon its more conservative contemporaries who believe in the old adage that "All things good come to him who waits."

It would not be becoming for us to comment on the characteristics attributed to this journal in the above quotation, but we may be permitted to remark, since the matter has been brought up, that the *World* is entirely correct in stating that the WESTERN ELECTRICIAN scored "a genuine scoop" over its contemporaries (including the *World*) by being the first to present a picture of the tower of light which forms such a prominent feature of the electricity building at the World's Fair.

After this generous admission on the part of our eastern contemporary, we are puzzled to account for its subsequent declaration that the WESTERN ELECTRICIAN "may justly pride itself upon being a good second to (and only two months behind) the *Electrical World*." These two statements are not consistent. How, if we made "a genuine scoop" on our contemporaries, could we have done so by publishing what one of them had covered two month before? In transporting an important portion of its staff to the rush and whirl of Chicago life, our New York contemporary has become somewhat confused, and appears to have lost, temporarily at least, the clearness of mental vision so necessary to the proper conduct of a technical journal.

The *World* evidently refers, by its "two months behind" allusion, to a sketch printed in its issue of April 8th and labeled "The Central Exhibit of the Electricity Building." But this was not a picture of the tower of light. Far from it. It was simply the artist's idea of what the structure would look like—pictorial guess work, in fact. No one will deny that the attempt was ingenious and audacious, and it is not difficult to detect a resemblance between the *World's* sketch and the tower as actually built. But it cannot be claimed for an instant that this delineation is a representation of the complete structure. A comparison of the picture with the WESTERN ELECTRICIAN'S illustration, made from the first photograph of the tower, will show the difference between imagination and solid fact. As well might the *World* have guessed at the result of the Goebel lamp case, and afterward, on seeing the WESTERN ELECTRICIAN'S extra with the decision in full, plumed itself on having the first report of the decision of the court. No; the WESTERN ELECTRICIAN printed the first picture of the tower of light—first in this as it is in all matters connected with the electrical features of the World's Fair.

The description accompanying the picture of April 8th shows that the whole thing was simply guess work. It speaks of the tower as 72 feet in height; of the "enormous glass shaft," and of "the powerful arc lamp, which surmounts the brilliant pile." Even the name attached to the structure was not known, and all the statements quoted are incorrect. The introduction of an arc lamp on a tower erected to glorify the incandescent light was particularly unfortunate. The whole production revealed simply an effort to strike the right thing by surmise—a feat not without parallel in the previous history of the *World*.

Evidently alluding to a controversy in which it has recently been engaged, and with which we have no concern, our contemporary expresses some solicitude at the manner in which the picture came in our possession. We are happy to be able to assure it that our conscience is easy on that score. Indeed, from the title of the article and the subsequent extended reference to the "carpenters' plans" of another contemporary, we more than suspect that the burden of the *World's* quizzical remarks is directed at that contemporary. However that may be, we desire to make clear one point—the sketch in the *World* of April 8th was not a picture of the tower of light, the first authentic illustration of that structure appearing in the WESTERN ELECTRICIAN of June 3d.

Light and other High Frequency Phenomena.

(*Continued from page* 325).

to join the condenser in series with the self-induction. It is clear that in such combinations there will be, for a given frequency, and considering only the fundamental vibration, values which will give the best result, with the condenser in shunt to the self-induction coil; of course more such values than with the condenser in series. But practical conditions determine the selection. In the latter case in performing the experiments one may take a small self-induction and a large capacity or a small capacity and a large self-induction, but the latter is preferable, because it is inconvenient to adjust a large capacity by small steps. By taking a coil with a very large self-induction the critical capacity is

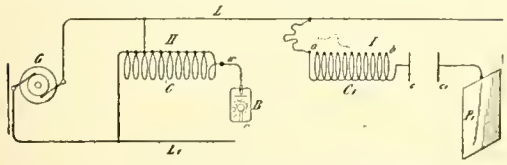

FIG. 20. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—PLAN FOLLOWED IN OBSERVING THE EFFECTS OF RESONANCE.

reduced to a very small value, and the capacity of the coil itself may be sufficent. It is easy, especially by observing certain artifices, to wind a coil through which the impedance will be reduced to the value of the ohmic resistance only and for any coil there is, of course, a frequency at which the maximum current will be made to pass through the coil. The observation of the relation between self-induction, capacity and frequency is becoming important in the operation of alternate current apparatus, such as transformers or motors, because by a judicious determination of the elements the employment of an expensive condenser becomes unnecessary. Thus it is possible to pass through the coils of an alternating current motor under the normal working conditions the required current with a low electromotive force and do away entirely with the false current, and the larger the motor the easier such a plan becomes practicable; but it is necessary for this to employ currents of very high potential or high frequency.

In Fig. 20 *i* is shown a plan which has been followed in the study of the resonance effects by means of a high frequency alternator. *C* is a coil of many turns, which is divided in small separate sections for the purposes of adjustment. The final adjustment was made sometimes with a few thin iron wires (though this is not always advisable) or with a closed secondary. The coil *C* is connected with one of its ends to the line *L* from the alternator *G*, and with the other end to one of the plates *c* of a condenser cc_1, the plate c_1 of the latter being connected to a much larger plate P_1. In this manner both capacity and self-induction were adjusted to suit the dynamo frequency.

As regards the rise of potential through resonant action, of course, theoretically, it may amount to anything since it depends on self-induction and resistance, and since these may have any value. But in practice one is limited in the selection of these values, and besides these there are other limiting causes. One may start with, say, 1,000 volts, and raise the electromotive force to fifty times that value, but one cannot start with 100,000 and raise it to ten times that value because of the losses in the media, which are great, especially if the frequency is high. It should be possible to start with, for instance, two volts from a high or low frequency circuit of a dynamo and raise the electromotive force to many hundred times that value. Thus coils of the proper dimensions might be connected each with only one of its ends to the mains from a machine of low electromotive force, and though the circuit of the machine would not be closed in the ordinary acceptance of

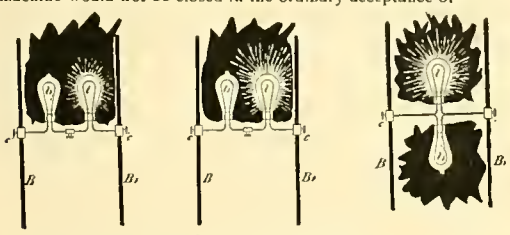

FIG. 22*a*, 22*b* AND 22*c*. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—SHOWING THE EFFECT OF THE PRESENCE OF A GASEOUS MEDIUM.

the term, yet the machine might be burned out if a proper resonance effect would be obtained. I have not been able to produce, nor have I observed with currents from the dynamo machine, such great rises of potential. It is possible, if not probable, that with currents obtained from apparatus containing iron the disturbing influence of the latter is the cause that these theoretical possibilities cannot be realized. But if such is the case I attribute it solely to the hysteresis and Faucault current losses in the core. Generally it was necessary to transform upward, when the electromotive force was very low, and usually an ordinary form of induction coil was employed, but sometimes the arrangement illustrated in Fig. 20 II has been found to be convenient. In this case a coil *C* is made in a great many sections, a few of these being used as the primary. In this manner both primary and secondary are adjustable. One end of the coil is connected to the line L_1 from the alternator, and the other line *L* is connected to the intermediate point of the coil. Such a coil with adjustable primary and secondary will be found also convenient in experiments with the disruptive discharge. When true resonance is obtained the top of the wave must of course be on the free end of the coil as, for instance, at the termi-

FIG. 23. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—CURIOUS INCANDESCENCE OF A WIRE.

nal of the phosphoresence bulb *B*. This is easily recognized by observing the potential of a point on the wire *w* nearer to the coil.

In connection with resonance effects and the problem of transmission of energy over a single conductor which was previously considered, I would say a few words on a subject which constantly fills my thoughts and which concerns the welfare of all. I mean the transmission of intelligible signals or perhaps even power to any distance without the

FIG. 21. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—ENERGY TRANSMISSION TO ANY DISTANCE WITHOUT WIRES.

use of wires. I am becoming daily more convinced of the practicability of the scheme; and though I know full well that the great majority of scientific men will not believe that such results can be practically and immediately realized, yet I think that all consider the developments in recent years by a number of workers to have been such as to encourage thought and experiment in this direction. My conviction has grown so strong that I no longer look upon this plan of energy or intelligence transmission as a mere theoretical possibility, but as a serious problem in electrical engineering, which must be carried out some day. The idea of transmitting intelligence without wires is the natural outcome of the most recent results of electrical investigations. Some enthusiasts have expressed their belief that telephony to any distance by induction through the air is possible. I cannot stretch my imagination so far, but I do firmly believe that it is practicable to disturb

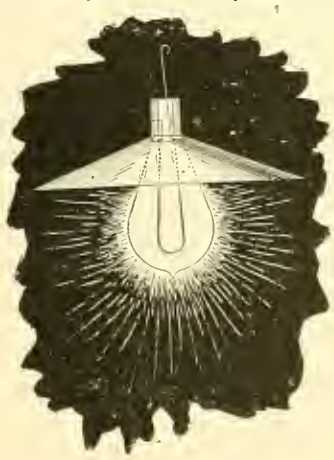

FIG. 24. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—UTILIZING THE HEATING EFFECT OF CONDUCTION CURRENT AND BOMBARDMENT.

by means of powerful machines the electrostatic condition of the earth and thus transmit intelligible signals and perhaps power. In fact, what is there against the carrying out of such a scheme? We now know that electric vibration may be transmitted through a single conductor. Why then not try to avail ourselves of the earth for this purpose? We need not be frightened by the idea of distance. To the weary wanderer counting the mile-posts the earth may appear very large, but to that happiest of all men, the astronomer, who gazes at the heavens and by their standard judges the magnitude of our globe, it appears very small. And so I think it must seem to the electrician, for when he considers the speed with which an electric disturbance is propagated through the earth all his ideas of distance must completely vanish.

A point of great importance would be first to know what is the capacity of the earth, and what charge does it contain if electrified? Though we have no positive evidence of a charged body existing in space without other oppositely electrified bodies being near, there is a fair probability that the earth is such a body, for by whatever

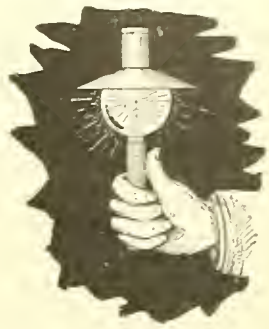

FIG. 26. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—INCANDESCENCE OF A SOLID.

process it was separated from other bodies—and this is the accepted view of its origin—it must have retained a charge, as occurs in all processes of mechanical separation. If it be a charged body insulated in space its capacity should be extremely small, less than one-thou-

FIG. 25. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—ILLUSTRATING LATERAL DIFFUSION.

sandth of a farad. But the upper strata of the air are conducting, and so, perhaps, is the medium in free space beyond the atmosphere, and these may contain an opposite charge. Then the capacity might be incomparably greater. In any case it is of the greatest importance to get an idea of what quantity of electricity the earth contains. It is difficult to say whether we shall ever acquire this necessary knowledge, but there is hope that we may

FIG. 27. LIGHT AND OTHER HIGH FREQUENCY PHENOMENA.—PHOSPHORESCENCE.

and that is by means of electrical resonance. If ever we can ascertain at what period the earth's charge, when disturbed, oscillates with respect to an oppositely electrified system or known circuit, we shall know a fact possibly of the greatest importance to the welfare of the human race.

I propose to seek for the period by means of an electrical oscillator, or a source of alternating electric currents. One of the terminals of the source would be connected to earth as, for instance, to the city water mains, the other to an insulated body of large surface. It is possible that the outer conducting air strata or free space contains an opposite charge and that, together with th

earth, they form a condenser of very large capacity. In such case the period of vibration may be very low and an alternating dynamo machine might serve for the purpose of the experiment. I would then transform the current to a potential as high as it would be found possible and connect the ends of the high tension secondary to the ground and to the insulated body. By varying the frequency of the currents and carefully observing the potential of the insulated body and watching for the disturbance at various neighboring points of the earth's surface resonance might be detected. Should, as the majority of scientific men in all probability believe, the period be extremely small, then a dynamo machine would not do and a proper electrical oscillator would have to be produced and perhaps it might not be possible to obtain such rapid vibrations. But whether this be possible or not, and whether the earth contains a charge or not, and whatever may be its period of vibration, it certainly is possible—for of this we have daily evidence—to produce some electrical disturbance sufficiently powerful to be perceptible by suitable instruments at any point of the earth's surface.

Assume that a source of alternating currents S be connected, as in Fig 21, with one of its terminals to earth (conveniently to the water mains) and with the other to a body of large surface P. When the electric oscillation is set up there will be a movement of electricity in and out of P, and alternating currents will pass through the earth, converging to, or diverging from, the point C where the ground connection is made. In this manner neighboring points on the earth's surface within a certain radius will be disturbed. But the disturbance will diminish with the distance, and the distance at which the effect will still be perceptible will depend on the quantity of electricity set in motion. Since the body P is insulated, in order to displace a considerable quantity the potential of the source must be excessive, since there would be limitations as to the surface of P. The conditions might be adjusted so that the generator or source S will set up the same electrical movement as though its circuit were closed. Thus, it is certainly practicable to impress an electric vibration at least of a certain low period, upon the earth, by means of proper machinery. At what distance such a vibration, might be made perceptible can only be conjectured. I have on another occasion considered the question how the earth might behave to electric disturbances. There is no doubt that, since in such an experiment the electrical density at the surface could be but extremely small considering the size of the earth, the air would not act as a very disturbing factor and there would be not much energy lost through the action of the air which would be the case if the density were great. Theoretically, then, it could not require a great amount of energy to produce a disturbance perceptible at great distance, or even all over the surface of the globe. Now it is quite certain that at any point within a certain radius of the source S a properly adjusted self-induction and capacity device can be set in action by resonance. But not only can this be done, but another source S_1 Fig. 21, similar to S, or any number of such sources can be set to work in synchronism with the latter, and the vibration thus intensified and spread over a large area, or a flow of electricity produced to or from the source S_1 if the same be of opposite phase to the source S. I think that beyond doubt it is possible to operate electrical devices in a city through the ground or pipe system by resonance from an electrical oscillator located at a central point. But the practical solution of this problem would be of incomparably smaller benefit to man than the realization of the scheme of transmitting intelligence or perhaps power to any distance through the earth or environing medium. If this is at all possible, distance does not mean anything. Proper apparatus must first be produced by means of which the problem can be attacked, and I have devoted much thought to this subject. I am firmly convinced that it can be done and hope that we shall live to see it done.

Returning now to the light effects which it has been the chief object to investigate, it is thought proper to divide these effects into four classes: 1. Incandescence of a solid. 2. Phosphoresence. 3. Incandescence or phosphorescence of a rarefied gas, and 4. Luminosity produced in a gas at ordinary pressure. The first question is: How are these luminous effects produced? In order to answer this question as satisfactorily as I am able to do in the light of accepted views and with the experience acquired, and to add some interest to this demonstration, I shall dwell here upon a feature which I consider of great importance, inasmuch as it promises, besides, to throw a better light upon the nature of most of the phenomena produced by high frequency electric currents. I have on other occasions pointed out the great importance of the presence of the rarefied gas or atomic medium in general around the conductor through which alternate currents of high frequency are passed, as regards the heating of the conductor by the currents. My experiments, described some time ago, have shown that the higher the frequency and potential difference of the currents the more important becomes the rarefied gas in which the conductor is immersed as a factor of the heating. The potential difference, however, is, as I then pointed out, a more important element than the frequency. When both of these are sufficiently high the heating may be almost entirely due to the presence of the rarefied gas. The experiments to follow will show the importance of the rarefied gas, or generally of gas at ordinary or other pressure, as regards the incandescence or other luminous effects produced by currents of this kind.

I take two ordinary 50 volt 16 candle power lamps which are in every respect alike, with the exception that one has been opened at the top and the air has filled the bulb, while the other is at the ordinary degree of exhaustion of commercial lamps. When I attach the lamp which is exhausted to the terminal of the secondary of the coil, which I have already used, as in experiments illustrated in Fig. 19a for instance, and turn on the current, the filament as you have before seen comes to high incandescence. When I attach the second lamp, which is filled with air, instead of the former, the filament still glows, but much less brightly. This experiment illustrates only in part the truth of the statements before made. The importance of the filaments being immersed in rarefied gas is plainly noticeable but not to such a degree as might be desirable. The reason is that the secondary of this coil is wound for low tension, having only 150 turns, and the potential difference at the terminals of the lamp is therefore small. Were I to take another coil with many more turns in the secondary, the effect would be increased, since it depends partially on the potential difference, as before remarked. But since the effect likewise depends on the frequency, it may be properly stated that it depends on the time rate of the variation of the potential difference. The greater this variation the more important becomes the gas as an element of heating. I can produce a much greater rate of variation in another way, which, besides, has the advantage of doing away with the objections, which might be made in the experiment just shown, even if both the lamps were connected in series or multiple arc to the coil, namely, that in consequence of the reactions existing between the primary and secondary coil the conclusions are rendered uncertain. This result I secure by charging from an ordinary transformer, which is fed from the alternating current supply station, a battery of condensers, and discharging the latter directly through a circuit of small self-induction, as before illustrated in Figs. 19a, 19b, 19c.

In Figs. 22a, 22b and 22c, the heavy copper bars BB_1 are connected to the opposite coatings of a battery of condensers, or generally in such way that the high frequency or sudden discharges are made to traverse them. I connect first an ordinary 50 volt incandescent lamp to the bars by means of the clamps cc. The discharges being passed through the lamp, the filament is rendered incandescent, though the current through it is very small, and would not be nearly sufficient to produce a visible effect under the conditions of ordinary use of the lamp. Instead of this I now attach to the bars another lamp exactly like the first, but with the seal broken off, the bulb being therefore filled with air at ordinary pressure. When the discharges are directed through the filament, as before, it does not become incandescent. But the result might still be attributed to one of the many possible reactions. I therefore connect both the lamps in multiple arc as illustrated in Fig. 22a. Passing the discharges through both the lamps, again the filament in the exhausted lamp l glows very brightly, while that in the non-exhausted lamp l_1 remains dark as previously. But it should not be thought that the latter lamp is taking only a small fraction of the energy supplied to both the lamps; on the contrary, it may consume a considerable portion of the energy, and it may become even hotter than the one which burns brightly. In this experiment the potential difference at the terminals of the lamps varies in sign theoretically three to four million times a second. The ends of the filaments are correspondingly electrified, and the gas in the bulbs is violently agitated and a large portion of the supplied energy is thus converted into heat. In the non-exhausted bulb there being a few million times more gas molecules than in the exhausted one, the bombardment, which is most violent at the ends of the filament in the neck of the bulb, consumes a large portion of the energy without producing any visible effect. The reason is that there being many molecules, the bombardment is quantitatively considerable, but the individual impacts are not very violent. The speeds of the molecules are comparatively small, owing to the small free path. In the exhausted bulb, on the contrary, the speeds are very great, and the individual impacts are violent, and therefore better adapted to produce a visible effect. Besides, the convection of heat is greater in the former bulb. In both the bulbs the current traversing the filaments is very small, incomparably smaller than that which they require on an ordinary low frequency circuit. The potential difference, however, at the ends of the filaments is very great, and might be possibly 20,000 volts or more, if the filaments were straight and their ends far apart. In the ordinary lamp a spark generally occurs between the ends of the filament or between the platinum wires outside, before such a difference of potential can be reached.

It might be objected in the experiment before shown that the lamps, being in multiple arc, the exhausted lamp might take a much larger current and that the effect observed might not be exactly attributable to the action of the gas in the bulbs. Such objections will lose much weight if I connect the lamps in series, with the same result. When this is done and the discharges are directed through the filaments it is again noted that the filament in the non-exhausted bulb l_1 remains dark, while that in the exhausted one (l) glows even more intensely than under its normal conditions of working, Fig. 22b. According to general ideas the current through the filaments should now be the same, were it not modified by the presence of the gas around the filaments.

At this juncture I may point out another interesting feature, which illustrates the effect of the rate of change of potential of the currents. I will leave the two lamps connected in series to the bars BB_1 as in the previous experiment, Fig. 22b, but will presently reduce considerably the frequency of the currents, which was excessive in the experiment just before shown. This I may do by inserting a self-induction coil in the path of the discharges, or by augmenting the capacity of the condensers. When I now pass these low-frequency discharges through the lamps, the exhausted lamp l again is as bright as before, but it is noted also that the non-exhausted lamp l_1 glows, though not quite as intensely as the other. Reducing the current through the lamps, I may bring the filament in the latter lamp to redness, and, though the filament in the exhausted lamp l is bright, Fig. 22c, the degree of its incandescence is much smaller than in Fig. 22b, when the currents were of a much higher frequency.

In these experiments the gas acts in two opposite ways in determining the degree of the incandescence of the filaments, that is, by convection and bombardment. The higher the frequency and potential of the currents, the more important becomes the bombardment. The convection on the contrary should be the smaller, the higher the frequency. When the currents are steady, there is practically no bombardment and convection may therefore with such currents also considerably modify the degree of incandescence and produce results similar to those just before shown. Thus, if two lamps exactly alike, one exhausted and one not exhausted, are connected in multiple arc or series to a direct current machine, the filament in the non-exhausted lamp will require a considerably greater current to be rendered incandescent. This result is entirely due to convection and the effect is the more prominent the thinner the filament. Professor Ayrton and Mr. Kilgour some time ago published quantitative results concerning the thermal emissivity by radiation and convection in which the effect of thin wires was clearly shown. This effect may be strikingly illustrated by preparing a number of small short glass tubes, each containing through its axis the thinnest obtainable platinum wire. If these tubes be highly exhausted, a number of them may be connected in multiple arc to a direct-current machine and all of the wires may be kept at incandescence with a smaller current than that required to render incandescent a single one of the wires if the tube be not exhausted. Could the tubes be so highly exhausted that convection would be nil, then the relative amounts of heat given off by convection and radiation could be determined without the difficulties attending thermal quantitative measurements. If a source of electric impulses of high frequency and very high potential is employed, a still greater number of the tubes may be taken and the wires rendered incandescent by a current not capable of warming perceptibly a wire of the same size immersed in air at ordinary pressure, and conveying the energy to all of them.

I may here describe a result which is still more interesting, and to which I have been led by the observation of these phenomena. I noted that small differences in the density of the air produced a considerable difference in the degree of incandescence of the wires, and I thought that, since in a tube, through which a luminous discharge is passed, the gas is generally not of uniform density, a very thin wire contained in the tube might be rendered incandescent at certain places of smaller density of the gas, while it would remain dark at the places of greater density where the convection would be greater and the bombardment less intense. Accordingly a tube t was prepared, as illustrated in Fig. 23, which contained through the middle a very fine platinum wire w. The tube was exhausted to a moderate degree and it was found that when it was attached to the terminal of a high frequency coil the platinum wire w would, indeed, become incandescent in patches, as illustrated in Fig. 23. Later a number of these tubes with one or more wires were prepared, each showing this result. The effect was best noted when the striated discharge occurred in the tube, but was also produced when the striæ were not visible, showing that, even then, the gas in the tube was not of uniform density. The position of the striæ was generally such that the rarefactions corresponded to the places of incandescence or greater brightness on the wire w. But in a few instances it was noted that the bright spots on the wire were covered by the dense parts of the striated discharge as indicated by l in Fig. 23, though the effect was barely perceptible. This was explained in a plausible way by assuming, that the convection was not widely different in the dense and rarefied places, and that the bombardment was greater on the dense places of the striated discharge. It is, in fact, often observed in bulbs, that under certain conditions a thin wire is brought to higher incandescence when the air is not too highly rarefied. This is the case when the potential of the coil is not high enough for the vacuum, but the result may be attributed to many different causes. In all cases this curious phenomenon of incandescence disappears when the tube, or rather the wire, acquires throughout a uniform temperature.

Disregarding now the modifying effect of convection there are then two distinct causes which determine the incandescence of a wire or filament with varying currents, that is, conduction current and bombardment. With steady currents we have to deal only with the former of these two causes, and the heating effect is a minimum, since the resistance is least to steady flow. When the current is a varying one, the resistance is greater and hence the heating effect is increased. Thus if the rate of change of the current is very great, the resistance may increase to such an extent that the filament is brought to incandescence with inappreciable currents, and we are able to take a short and thick block of carbon or other material and bring it to bright incandescence with a current incomparably smaller than that required to bring to the same degree of incandescence an ordinary thin lamp filament with a steady or low frequency current. This result is important, and illustrates how rapidly our views on these subjects are changing, and how quickly our field of knowledge is extending. In the art of incandescent lighting, to view this result in one aspect only, it has been commonly considered as an essential requirement for practical success, that the lamp filament should be thin and of high resistance. But now we know that the resistance to the steady flow of the filament does not mean anything; the filament might as well be short and thick; for if it be immersed in rarefied gas it will become incandescent by the passage of a small current. It all depends on the frequency and potential of the currents. We may conclude from this, that it would be of advantage, so far as the lamp is considered, to employ high frequencies for lighting, as they allow the use of short and thick filaments and smaller currents.

If a wire or filament be immersed in a homogeneous medium, all the heating is due to true conduction current, but if it be enclosed in an exhausted vessel the conditions are entirely different. Here the gas begins to act, and the heating effect of the conduction current, as is shown in

many experiments, may be very small compared with that of the bombardment. This is especially the case if the circuit is not closed, and the potentials, of course, very high. Suppose a fine filament enclosed in an exhausted vessel be connected with one of its ends to the terminal of a high tension coil and with its other end to a large insulated plate. Though the circuit is not closed, the filament, as I have before shown, is brought to incandescence. If the frequency and potential be comparatively low, the filament is heated by the current passing through it. If the frequency and potential, and principally the latter, be increased, the insulated plate need be but very small, or may be done away with entirely, still the filament will become incandescent, practically all the heating being then due to the bombardment. A practical way of combining both the effects of conduction current and bombardment is illustrated in Fig. 24, in which an ordinary lamp is shown, provided with a very thin filament, which has one of the ends of the latter connected to a shade serving the purpose of the insulated plate, and the other end to the terminal of a high tension source. It should not be thought that only rarefied gas is an important factor in the

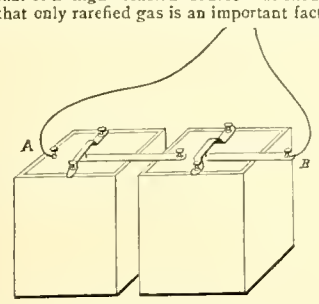

FIG. 2. A NEW BATTERY.

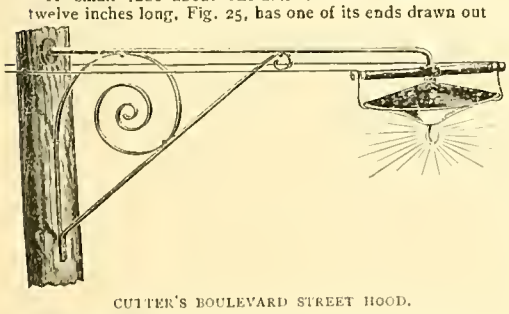
heating of a conductor by varying currents, but gas at ordinary pressure may become important if the potential difference and frequency of the currents is excessive. On this subject I have already stated that when a conductor is fused by a stroke of lightning the current through it may be exceedingly small, not even sufficient to heat the conductor perceptibly were the latter immersed in a homogeneous medium.

From the preceding it is clear that when a conductor of high resistance is connected to the terminals of a source of high frequency currents of high potential, there may occur considerable dissipation of energy, principally on the ends of the conductor, in consequence of the action of the gas surrounding the conductor. Owing to this, the current through a section of the conductor at a point midway between its ends may be much smaller than through a section near the ends. Furthermore, the current passes principally through the outer portions of the conductor, but this effect is to be distinguished from the skin effect as ordinarily interpreted, for the latter would or should occur also in a continuous incompressible medium. If a great many incandescent lamps are connected in series to a source of such currents, the lamps at the ends may burn brightly, whereas those in the middle may remain entirely dark. This is due principally to bombardment, as before stated. But even if the currents be steady, provided the difference of potential be very great, the lamps at the ends will burn more brightly than those in the middle. In such case there is no rhythmical bombardment and the result is produced entirely by leakage. This leakage or dissipation into space when the tension is high is considerable when incandescent lamps are used, and still more considerable with arcs, for the latter act like flames. Generally, of course, the dissipation is much smaller with steady than with varying currents.

I have contrived an experiment which illustrates in an interesting manner the effect of lateral diffusion. If a very long tube is attached to the terminal of a high frequency coil, the luminosity is greatest near the terminal and falls off gradually toward the remote end. This is more marked if the tube is narrow.

A small tube about one-half inch in diameter and twelve inches long, Fig. 25, has one of its ends drawn out



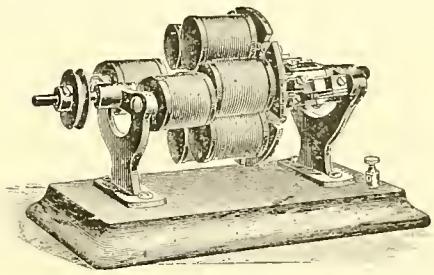
CUTTER'S BOULEVARD STREET HOOD.

into a fine fiber f nearly three feet long. The tube is placed in a brass socket T, which can be screwed on the terminal T_1 of the induction coil. The discharge passing through the tube first illuminates the bottom of the same, which is of comparatively large section; but through the long glass fiber the discharge cannot pass. But gradually the rarefied gas inside becomes warmed and more conducting and the discharge spreads into the glass fibre. This spreading is so slow that it may take half a minute or more until the discharge has worked through up to the top of the glass fiber, then presenting the appearance of a strongly luminous thin thread. By adjusting the potential at the terminal the light may be made to travel upward at any speed. Once, however, the glass fiber is heated the discharge breaks through its entire length instantly. The interesting point to be noted is that, the higher the frequency of the currents, or in other words, the greater relatively the lateral dissipation, at a slower rate may the light be made to propagate through the fiber. This experiment is best performed with a highly exhausted and freshly made tube. When the tube has been used for some time the experiment often fails. It is possible that the gradual and slow impairment of the vacuum is the cause. This slow propagation of the discharge through a very narrow glass tube corresponds exactly to the propagation of heat through a bar warmed at one end. The quicker the heat is carried away laterally the longer time it will take for the heat to warm the remote end. When the current of a low frequency coil is passed through the fiber from end to end, then the lateral dissipation is small and the discharge instantly breaks through almost without exception.

After these experiments and observations, which have shown the importance of the discontinuity or atomic structure of the medium and which will serve to explain, in a measure at least, the nature of the four kinds of light effects produceable with these currents, I may now give you an illustration of these effects. For the sake of interest I may do this in a manner which to many of you might be novel. You have seen before that we may now convey the electric vibration to a body by means of a single wire or conductor of any kind. Since the human frame is conducting I may convey the vibration through my body.

First, as in some previous experiments, I connect my body with one of the terminals of a high tension transformer and take in my hands an exhausted bulb which contains a small carbon button mounted upon a platinum wire leading to the outside of the bulb, and the button is rendered incandescent as soon as the transformer is set to work, Fig. 26. I may place a conducting shade on the bulb, which serves to intensify the action, but is not necessary. Nor is it required that the button should be in conducting connection with the hand through a wire leading through the glass, for sufficient energy may be transmitted through the glass itself by inductive action to render the button incandescent.

Next I take a highly exhausted bulb containing a strongly phosphorescent body, above which is mounted a small plate of aluminum on a platinum wire leading to the



MASON MOTOR.

outside, and the currents flowing through my body excite intense phosphorescence in the bulb, Fig. 27.

Mason Motor.

The motor in the accompanying illustration is the invention of J. H. Mason, of the Mason Electric company, of New York, and is known as the Mason motor No. 2. It is fitted with nickel plated cover, and is especially adapted for running sewing machines and other small machinery. All parts are interchangeable. Through a very unique plan, in the construction of these motors a past and serious drawback in the way of the working loose of the terminals, or binding posts, which is occasioned by the constant vibration of the armature, thereby making poor contact in the connecting wires, has been overcome. It is especially designed to work at a fast rate of speed for running the small ventilating electric fans.

A New Battery.

The Atlantic is the name of a new primary battery which has found its way on the market and which is quite worthy of mention. Fig. 1 shows the interior of the battery. It consists of an india rubber cell 6½ inches by 7 inches by 8 inches high, 18 carbon pencils, a porous cup and a zinc element. Without lifting the cover, which is of the tight fitting kind, or disconnecting the wires when the battery is not in operation, the zinc can be raised out of the solution by a handle on the cover. Any two fluid carbon battery solutions can be used. When fully charged, the battery shows on short circuit, it is claimed, 40 amperes and 2 volts, and has a capacity of 150 amperc hours. It is so constructed that the connections will not corrode, and there is no change in internal resistance. It will maintain constant electromotive force during the life of the charge, and there is no consumption of zinc while the battery is not in operation.

Fig. 2 shows the battery when used in series of two or more cells. This battery is very compact and well constructed, and is especially adapted for medical purposes to run fan motors, phonographs, etc., and is being introduced by the Electro-chemical & Specialty company, 136 Liberty street, New York.

Cutter's Boulevard Street Hood.

The accompanying illustration shows an ornamental form of street hood for electric lamps, for use where the regular gooseneck is too plain. It is brought out by George Cutter, Chicago. The hood proper has the same carefully worked out details as Mr. Cutter's standard forms, including the special nozzles and hinge. The supporting bracket was made with particular attention to strength for bearing the weight of the lamp at a distance of from three to six feet from the pole or wall. The conducting wires are well insulated from the bracket arm and always in plain sight, so as to avoid all chances of grounds. The Cutter boulevard street hood seems to be meeting with

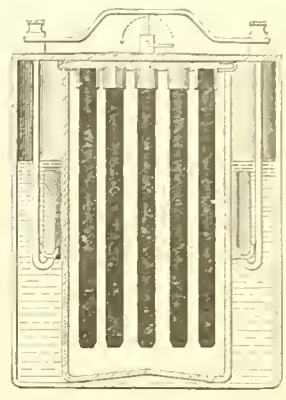


FIG. 1. A NEW BATTERY.

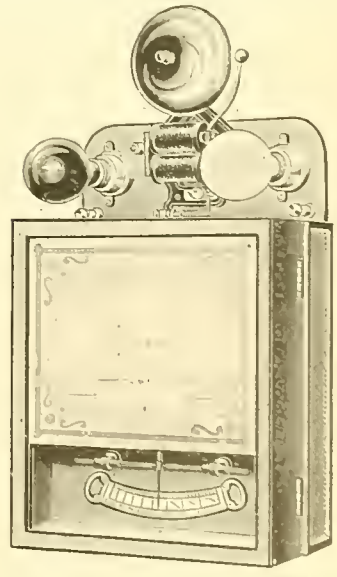
good success, for Mr. Cutter has already supplied large numbers to western towns.

The Tice-Lintner Potential Indicator.

The improved form of the Tice-Lintner potential indicator, as recently placed upon the market, is shown in the accompany illustration, and while not differing materially from the original instrument contains several improvements that go to make it a most perfect indicator. The advantages accruing from close potential regulation are so obvious that it is unnecessary to dwell at length upon them. Repeated tests with high efficiency lamps have been made with this instrument, resulting in every instance in increasing the life claimed for them. The Tice-Lintner potential indicator combines with a voltmeter of the highest degree of accuracy, permanency and dead-beat qualities, an alarm attachment of equal reliability, which immediately attracts the attention of the attendant to any change or variation in pressure, and the same is remedied before any damages ensues to the lamps or motors on the working circuits. Aside from the alarm the especial features of the instrument are the entire lack of permanent magnets, or any other deteriorating element, and the fact that it can be operated in the close vicinity of intense magnetic fields without disturbing the accuracy of



TICE-LINTNER POTENTIAL INDICATOR.

its reading. A neat circular is now being issued containing a full and complete description of the instrument, and all interested in prolonging the life and efficiency of their lamps should send for one to the Tice Lintner Electric company, Minneapolis, Minn.

The question of electric street lighting in Zumbrota, Minn., is being agitated.

CORRESPONDENCE.

New York Notes.

NEW YORK, June 17.—It is the unexpected that happens. There is a strong impression rife that when the four members of the Rapid Transit Commission resigned, they were sanguine that the remaining commissioner, Mr. Starin, would take a similar step, and that his resignation would be promptly accepted, while they would be induced to reconsider their resignations and agree to act with a new commissioner who would be in harmony with their views. However, Mr. Starin disobligingly stuck to his post, and thus circumvented such a procedure, if it were intended. Mayor Gilroy says it has cost the city $120,000 to teach the present commissioners something about rapid transit, and he does not propose that that amount shall be entirely wasted. He holds that this expense cannot be made a charge upon the purchasers of franchises, nor is there any means of having it refunded. He therefore declines to accept the proffered resignations of the four commissioners until he becomes "fully convinced that it is hopeless to expect from the commission as at present constituted the relief that the city so urgently needs in the matter of rapid transit." An interesting feature of the week's developments in rapid transit matters has been the fluctuations in Manhattan stock. After the resignation of its friends on the commission, Manhattan stock immediately jumped up to 132. Two days after, however, when Mr. Starin stolidly showed himself proof against every effort to induce him to resign, confidence in Manhattan's eventual victory declined, and there was a drop of two points in the stock. It was expected that a meeting would be held by the commission immediately after Mayor Gilroy's ultimatum, but nothing has yet been done. None of the commissioners seems madly anxious to take upon himself the unwonted responsibility of arriving at a definite line of policy in this humid weather. Mr. Inman stated yesterday that after waiting three days for a meeting, his patience was exhausted and he was off to Chicago to see the fair and would not be back until some time in July. By the time he gets back Mr. Steinway will probably have gone to the country, as he is run down in health. Mr. Spencer has not yet returned from Saratoga, where he is recruiting, and Mr. Bushe said yesterday that he is soon going on a vacation. It is therefore not likely that there will be any progress toward rapid transit this summer. Mayor Gilroy is impatient at this further shelving of an issue of such importance, and has bidden the commissioners to meet on Monday next. You can call spirits from the vasty deep, but they may not come, and the extent of the response of the commissioners to the mayor's behest is an uncertain quantity. The conviction is growing that the only way for New York to get rapid transit is to treat with the Manhattan company. Mr. Steinway says: "There is no other way in which we can solve the problem even temporarily. An underground system will undoubtedly be the final system, but since the Broadway railroad exposures, the Panama Canal and other scandals, capital is very timid when asked to take part in a public enterprise where it will be tied up for several years. I do not believe we could today sell a franchise for an independent system of elevated roads for this city." So the Manhattan is the favorite today, but the next question is that even if the city comes to terms with it, how long is such relief as that step might bring to last. Possibly before the summer is ended something may be decided in accordance with which a date may be fixed for the beginning of preparations to furnish the city with some additional transit facilities. In the course of three or four years we may have these additional facilities in operation, but long before they arrive we shall have as much outgrown the capabilities of the improved system which they will supply as we have at present outgrown the existing systems.

Jesse H. Bonnell is probably as well known among electricians as Bourke Cockran is among lawyers and politicians, and a lively passage at arms is now imminent between the two notables. Mr. Bunnell seeks relief from the turmoil and heat of the city during the summer months at his place at Sands Point, Long Island, a resort now much affected by New Yorkers. It appears that Mr. Cockran has fenced up a highway leading to the house of Mr. Bonnell, who is not disposed to put up with this restriction of his comforts and privileges. The hearing on the matter has been adjourned pending the preparation of a survey of the road. This contest promises to result in a large amount of litigation in the town of North Hampstead. A "ready other" are following up Mr. Cockran's example, and are closing up highways that have been public thoroughfares for a century. The interest in the situation is increased by the fact that Mr. Cockran has been served with the same dish that he has provided for Mr. Bunnell. The administrators of the Travis estate have erected the sign "No Thoroughfare" in a part of the main highway between Great Neck and Port Washington. This was once a private road, but for 100 years it has been open to the public, being known as the 'short cut through Manhasset Valley." The closing of it will increase the distance which Mr. Cockran and others now have to travel from the railway station at Great Neck when driving to their homes on Sands Point from nine to fourteen miles. So, altogether, there is a brisk little melee on the way, and Mr. Bunnell's many friends hope that he will come out of his side of it triumphant.

The struggle for street railway franchises in Brooklyn continues, and those who happen to have a political "pull" in the city of churches just now are likely to find it a very convenient and profitable possession. The Union Street Railway company last week offered $15,000 per mile for certain streets and $10,000 a mile for others. The Railroad Committee of the Brooklyn Board of Aldermen hesitated to accept what was probably about half the value of these franchises, and the secretary of the company has now offered $20,000 per mile for the first lot and $12,000 a mile for the others. But there is a diversity of opinion in Brooklyn as to the necessity of multiplying franchises and filling up an indefinite number of steets with car lines in order that the financial prosperity of those in power and their friends may be promoted, and last night the Common council chamber in the city hall was stormed by more than 1,000 property owners who came to enter their protest against certain of the proposed franchises. The speeches of the protestants were all short and to the point. The general argument was that Brooklyn had already all the surface and elevated roads that it required, and that whatever further traveling facilities were needed could be supplied by the addition of more cars on the present routes. The ringing of the trolley gongs appears also to be a sore point in Brooklyn, and was referred to as an intolerable nuisance. One of the speakers brought down the house with a reference to the high standard of "official purity of heart" required in the members of the Brooklyn Board of Aldermen. Another speaker contended that, if the extension of trolley lines was continued, it would be impossible to drive anything in Brooklyn except cows, and that the increase in insanity would necessitate the establishment of another St. Johnland. Among those present was a large contingent of ladies, one of whom denounced with special vigor the attempt to destroy the pastoral calm of the "purely home-like streets" of the city of Brooklyn. The meeting, at all events, brought out one fact, on which New Yorkers can ponder with profit: It showed that, when the people of Brooklyn consider that municipal license is in danger of overstepping the bounds of toleration, they are not too apathetic and selfish to come together and raise their voice, in the protection of their rights as citizens.

As the time for declaring the dividend on General Electric draws near there is heard a revival of the criticism regarding the policy of the company in making such a large division of profits among shareholders. It is, however, a noticeable as well as a significant fact that the unfavorable comment does not come from the stockholders themselves, and that the price of the shares in the market has been holding up well for the last few weeks. It is well known that this stock has been persistently raided since last February by Cammack and other bear traders, and it has come out of the ordeal in better shape than at one time appeared to be likely. D. O. Mills, one of the directors of the General Electric, states that the company will undoubtedly pay its quarterly dividend of 2 per cent. on the 1st of August, and that a declaration to that effect will be made in the early part of July. Another officer of the company is reported to have said that the earnings at present are at the rate of 20 per cent. on the stock.

A jury in the Brooklyn City Court yesterday brought in a verdict for $5,000 in favor of Mrs. Samuel H. Morrison, against the Metropolitan Telephone & Telegraph company of this city. Mr. Morrison lost his life in the building of the company in Cortlandt street. He was delivering letters, when he stepped through an elevator and fell to the bottom of the shaft. W. F. O.

Northwestern Notations.

MINNEAPOLIS, June 17.—The triumph of electricity over steam in the matter of interurban passenger traffic at Minneapolis and St. Paul is now just about complete. The electric line had been operated but a short time when the companies operating the steam car "short line" trains saw the handwriting on the wall and began taking off trains. The Great Northern company practically withdrew some time ago. Now the Milwaukee and St. Paul company announces the discontinuance of all its "short line" service. This leaves nothing but the "through" trains. This will result in crowding the interurban electrics more than ever, and will furnish an additional incentive for the early completion of the proposed second interurban line via St. Anthony Park.

Out of a graduating class of 250 at the University of Minnesota the following named took degrees as bachelors of electrical engineering: Arthur William Chase, Hastings; William Harry Dewey, Minneapolis; John De Mott Guthrie, Minneapolis; George Hart Morse, La Crosse, Wis.; Frank Ervin Reidhead, Minneapolis; Frank Wesley Springer, Anoka.

The Phoenix Electric company of Duluth has made a voluntary assignment to W. H. Squire. The immediate cause was the bringing by the W. S. Edwards Manufacturing company of Chicago of a suit for $463 in the Municipal Court. The official statement of the affairs of the company shows assets of $6,721, of which half is in the shape of outstanding accounts. The liabilities foot up $11,438.

The Electrical Engineering & Supply company has decided to remove its extensive establishment from St. Paul to Minneapolis. It has leased a large building on Second avenue south, near Washington avenue, and will soon be quartered there. In addition to its large general business the company proposes to handle incandescent lamps. The Packard lamp will be turned out in large quantities. The territory assigned to this company covers the whole Northwest out to the Pacific coast.

Frank Arnot who has been employed as electrician by the Minneapolis Street Railway company for some time received fatal shock the other night. He was discharging his regular duty making a shift at the switchboard, regulating the currents. The theory is that in some manner he placed both hands on the switchboard, making a short circuit through his body. Death was not instantaneous. He was thrown to the floor, partially recovered himself and staggered some distance. Then he fell dead. City Electric Inspector Deming after a thorough examination pronounced death purely accidental. Arnot was twenty-eight years old, married, and the remains were taken to Le Sueur, Minn.

The Western Union Telegraph company received a serious blow in the big fires at Fargo, N. D. Its building and equipment were totally wrecked. Its recovery and resumption of business were notable under the circumstances.

J. A. Folsom and George F. Blossom, of Minneapolis, have an invention for a trolley wire conduit which has been pronounced by experts a success. The conduit is to be between the rails. The wire is hermetically sealed and contact is made by the double trolley wheel pressing down a spring section above. The exposed part is insulated as soon as the trolley wheel has passed. A great saving of electricity is claimed.

The Minneapolis council's underground wire committee proposes to have heroic measures taken to force the companies to take their wires down. The city inspector reports that the claim that 75 per cent. of the wires are already down in the conduit district is altogether too high an estimate.

A handsome electric launch has been bought by O. C. and A. W. Hartman, of Duluth, Minn., from the Columbian Launch company of New York. The boat is the Electra. She is 32 feet long, finished in mahogany and will carry 30 people. She will run 60 to 80 miles at a charge at a speed of about 10 miles per hour.

Articles of incorporation of the Boulder Electric Power company have been filed at Livingston, Mont. The principal places of business will be the village of Creighton, Knox county, Nebraska, and Boulder Mining District, Park county, Montana. The object of the organization is the development of water power, maintaining flumes and ditches, the erection of electric power plants and the leasing of electric powers to mining companies. The capital stock is $500,000. The incorporators are A. N. Hawley, L. P. Ash, Charles W. Hamilton and E. A. Crum. The annual statement of the company shows the capital stock actually paid in, to be $10,150; the amount of assets, $20,000, consisting of dynamos, water wheel, power house, etc. The liabilities amount to $4,000.

Messrs. Stevens and Robinson, two St. Paul capitalists, were in Litchfield, Minn., recently, with a proposition to buy the city waterworks and electric light plant there. Their offer was to give $20,000 for the plant, but to pay nothing down, and charge the city about $1,000 a year for hydrants, street lights and sprinkling. Most of the councilmen thought the offer unsatisfactory. A committee of five was appointed to consider the matter.

A peculiar fire occurred at the Minneapolis exposition building the other day, which Fire Inspector Deming has

been studying. He reports that fire originated at four points, two of them just above the main entrance on the west side of the building, one under the flooring, where a stream of water made a connection between the earth and the woodenwork of the floor, and the last in the auditorium, where the principal damage was done. He has not fully solved the cause, but thinks that heavily charged wires crossed those running into the building and carried the current into the woodwork, fire ensuing wherever there was contact. The damage was nominal. The wires running into the building will be rearranged, so that there can be no possible chance of an accident of a similar nature.

It is said that the company that owns the electric light plant at Owatonna, Minn., is looking for a purchaser, and that the plant can be secured at a low figure. There is some talk of the city purchasing it.

The Western Union Telegraph company has declined to accept the ordinance requiring all electric companies in St. Paul to put their wires under ground within a certain territory. Three reasons were given for the refusal: First, that the ordinance discriminated in favor of the Edison Electric Light & Power company and the Northwestern Telephone Exchange company in exempting them from its provisions; second, "that we should be obliged to put down a certain mileage each year until January 1, 1897;" third, "that we should be subject to the provisions of any ordinance that the council may hereafter pass."

At a recent convention of the Minnesota Firemen's association there was much discussion of the matter of municipal control of electric wires. An agitation was started, which, it is thought, will result in some concerted action in this regard. N. L. P.

PERSONAL.

Russell Robb of the Shawmut Fuse Wire company, Boston, is in Chicago.

S. L. Firth, of the Novelty Electric company, Philadelphia, was in Chicago last week seeing the fair.

F. A. Hine, president of the Hine Eliminator company, New York, died at his residence at Tenafly, N. J., May 26th.

Anthony Reckenzaun of London is in Chicago, visiting the World's Fair, and looking after his interests in this country.

M. E. Baird of the Eddy Electric Manufacturing company, Windsor, Conn., was in Chicago last week. Mr. Baird was enthusiastic in his praise of the great exposition, and especially the electrical features.

NEW INCORPORATIONS.

Commercial Telegraph & Messenger company, New York, N. Y.; capital stock, $5,000; to construct and maintain lines of electric telegraph.

Riverside Electric company, Riverside, Cal.; capital stock, $100,000, generating electricity for all purposes, operating street railroads, etc.; Jarvis & Bush, Riverside, Cal.

Easton & Bangor Electric Railway company, Easton, Pa.; capital stock, $100,000; constructing and operating an electrical railway in Easton, Pa.; D. W. Nevin, Easton, Pa.

Portsmouth Street Railroad & Light company, Portsmouth, O.; capital stock, $125,000; operating a street railroad and furnishing light and power; Floyd L. Smith, Portsmouth, O.

Sloss-Stein Electric company, Chicago, Ill.; capital stock, $50,000; to manufacture and sell electric appliances, metal products and specialties; Sydney Stein, 85 Dearborn street, Chicago, Ill.

Independent Electric company, Chicago, Ill.; capital stock, $25,000; to do a general electrical manufacturing and machine shop business; H. E. Goodman, 39th street and Stewart avenue, Chicago, Ill.

Wagner Electro-medical company, Chicago, Ill.; capital stock, $50,000; to manufacture and sell physicians' electrical supplies and general electrical goods; Black & Goodwin, 1141 Rookery, Chicago, Ill.

Tri-City Power & Light company, Rock Island, Ill.; capital stock, $300,000; to manufacture appliances for and to furnish light, heat and power to inhabitants of Moline and Rock Island and vicinity, with gas, steam or electricity; R. H. MacMullan, Rock Island, Ill.

Citizens' Electric Light company of Wayne, Wayne, Pa.; capital stock, $5,000; supplying light, heat and power by means of electricity in Wayne, Pa.; J. S. Freman, 400 Chestnut street, Philadelphia, Pa.

Rogue River Water, Light & Power company, Grant's Pass, Ore.; capital stock, $50,000; to construct, equip, maintain and operate water works and an electric light system in the city of Grant's Pass, Ore.; George A. Pease, Portland, Ore.

International Storage Battery company, Detroit, Mich.; capital stock, $100,000; to manufacture and sell Woodward's tubular secondary electric storage battery and other electrical appliances; George W. Martin, 32 Ledyard street, Detroit, Mich.

C. & C. Electric company, Newark, N. J.; capital stock, $1,400,000; to manufacture and deal in electric motors and dynamos and electrical appliances; generating and transmitting light and power by electricity; Gould & Wilkie, 2 Wall street, New York, N. Y.

ELECTRIC LIGHTING.

The plant of the Galena, Ill., Electric Light company, it is rumored, will be removed to Baraboo, Wis.

Capitalists have made a proposition to the authorities of Fruitville, Cal., to erect an electric light plant.

Valley City, N. D., is soon to be electrically lighted. A twelve years' franchise has been granted.

At a special election, Onawa, Ia., authorized the expenditure of $8,000 to put in an electric light plant.

It is stated that a company will commence the work of putting in an electric light plant at Paola, Kan., shortly.

An electric light franchise has been granted to a company composed of Texas capitalists by the city council of El Reno, Ok.

The question of putting in an electric light plant at Ionia, Mich., to be owned and operated by the municipality, is being agitated.

After holding several town elections on the subject, Batavia, N. Y., has recently decided to construct and own its electric lighting plant.

At a recent election the people of Higginsville, Mo., voted to issue $17,000 in bonds for the establishment of an electric light and water works plant.

The people of Mellette, S. D., have under consideration a proposition to introduce electric lighting, the power to be derived from an artesian well.

Detroit, Mich., has decided to erect a municipal electric lighting plant, and bonds to the value of $600,000 have been authorized to pay for the same.

The Ida Grove, Ia., Electric company, with a capital stock of $15,000, has been organized, and contemplates supplying the town with electric light.

A concession has been granted for the establishment of a central electric light station and also an electric tramway at Pointe-aux-Trembles, near Montreal, Quebec.

The Waupun, Wis., Electric Light company has been granted a franchise to operate an electric light plant in that city. The city agrees to take 80 incandescent lights for street lighting.

An electric light company has been organized to put in a plant for electric lighting at Valley Falls, N. Y. It is also the intention of the company to furnish power and light for surrounding villages.

Garfield, Wash., voted on the question of bonding the city for electric light and waterworks recently. It was decided to issue bonds to the amount of $13,000 for waterworks and $7,000 for electric light.

The United States Electric Lighting company, Washington, D. C., has been granted permission to extend its underground conduits in many of the streets and avenues of the city. The work will be commenced at once.

The gas company which owns the concession for the establishment and operation of a central electric light station in Buda-Pesth, Austria, has given the contract for the electrical portion of the work to Schuckert & Co., Nuremberg, Germany.

A resolution has been introduced in the Houston, Tex., Council declaring it advisable for the city to maintain its own system of electric lighting and waterworks, and providing that a proposition be submitted to a vote of the people to authorize the creation of a bonded debt of $350,000 for that purpose.

The board of trustees of the Cleveland Asylum for the Insane, at Newburg, O., will receive proposals for the necessary wiring, dynamos, engines, etc., for the installation of an electric lighting plant for the asylum. The plant is to have a capacity of not less than 1,000 incandescent lights of 16 candle power, or their equivalent.

In the city of Gaudalajara, Mexico, is to be inaugurated this month a new system of electric lighting, which, it is said, will make it the best lighted city in Mexico. The power is generated at the great cataract of Juanacatlan, on the Santiago River, about fifteen miles from the city. The charge for incandescent lamps, of 16 candle power will be from 75 cents to $1 a month, in Mexican money—an unprecedentedly low rate for Mexico.

ELECTRIC RAILWAYS.

Lebanon and Myerstown, Pa., are to be connected by an electric railway.

It is proposed to establish an electric railway between Wellington and Nanaimo, B. C.

It is proposed to extend the electric railway at Ottawa, Can., to Hull, a neighboring town.

The extension of the electric railway from Concord, N. H., to Contoocook Park will soon be completed.

The Kingston, Ont., Street Railway company is applying for permission to change its power to electricity.

The Charleston, W. Va., Street Railway company has obtained a franchise for an electric street railway line.

An electric railway six miles in length connecting Portland, Me., and West Buxton in Saco Valley is projected.

Waterbury, Conn., proposes to replace horses with electric power on its street railways, and to largely extend the lines.

The Kanawha Electric Car company has asked the city council of Elk City, W. Va., for permission to build an electric line.

The Electric Railway Company has obtained control of the River View railway near Richmond, Va., and will equip it with electricity.

A bill is pending in the Pennsylvania Legislature limiting the carrying of freight on electric railways to 200 pounds for each package.

The electric railway between Yonkers and Mt. Vernon, N. Y., has been completed. Cars will run between the two cities every thirty minutes.

A project is on foot to construct and operate a trolley line between Rhinecliff and the town of Rhinebeck, New York, two and one-half miles distant.

Negotiations are progressing between the Vienna, Austria, Tramway company and Siemens & Halske, Berlin, with the view of adopting electric traction in Vienna.

A new electric street railway company has applied to the Brooklyn Council for a franchise over a number of streets in the city, offering $15,000 a mile for the same.

The East Woods Heights, N. Y., Electric Railway company's power house burned a short time ago. The Corliss engine, generators and cars were destroyed. The loss is $20,000; insurance, $10,000.

A survey has been made for an electric railroad from Potsdam to Colton, New York, and the Rachet Rover Railway company has been organized with a capital stock of $350,000 to construct and operate the same.

Upper Sandusky, O., is mentioned as the starting point of a 100 mile electric system, to pass through six county seats and smaller towns, and act as a feeder, in connection with a boat line, to northern Ohio lake resorts.

The cable line on the eastern portion of Seventh street, St. Paul, will be changed to electric, an ordinance for this purpose having passed the council. The cable line has been down several years, but as there is no severe grade on the line and as it has numerous electric branches, the change has become desirable.

The East St Louis Electric Street Railroad company has increased its capital stock to $500,000. With the proceeds of these bonds it will extend its railroad, erect a power house and supply the necessary machinery therefor and provide additional cars and equipment for the railroad and also provide for paying off and retiring its present outstanding five-twenty bonds.

The Chicago City Railway company has brought a suit against George H. Caxton to prevent him from moving a house across its tracks on Forty-seventh street, Chicago. It is alleged that as the house is twenty-eight feet high it will be necessary to cut the trolley wires and if this were done the company would suffer great damage, as the traffic of the road would be delayed for many hours.

The Cleveland Electric Railway company is meeting with the opposition of the city council in regard to the recent consolidation of street railways. The companies have consolidated without the consent of the council and without giving it an opportunity to fix any terms and conditions, and the board will begin proceedings in the courts to determine the legality of such consolidation.

The franchises and rights of way have been secured for an electric railway, to connect Van Buren, Ark., and Fort Smith. The proposed road will be 10 miles in length, and will bridge the Arkansas River at Fort Smith. The same company which proposes to construct this route has also bought the franchises of the Fort Smith Street Car company, and intends to belt the city with a line independent of the line to Van Buren.

Application has been made for a charter for the Paint Rock & Tennessee River Railway company. It is proposed to build an electric railway line from Winchester, Franklin county, Tenn., to McMinnville, by the way of Decherd, Viola and Beersheba Springs. The line is also to be extended to the head of Estill Rock Creek, of Paint Rock River, thence to Savannah, Mineral Springs, Lynchburg, Pulaski, Lawrenceburg and Waynesboro, in Wayne county.

Application has been made for a charter for the Robertson Southern Electric company in Tennessee to build an electric railway from Knoxville to Kingston, Oliver Springs, Popular Creek coal mines, Clinton, Andersonville, Powell's Valley, Lutrell, Maynardsville, Blaine's Cross Roads, Lee Springs, Strawberry Plains, Dandridge, Sevierville, Allegheny Springs and the Little Tennessee river. The company expects to handle both passengers and freight, and in effect to eventually construct a cheap system of railways through all East Tennessee.

The application of the Consolidated Traction company for use of twenty-six miles of streets in Newark, N. J., is believed to be part of a plan arranged by that company, which has its head in New York city, and a Philadelphia syndicate to complete a system of lines connecting Jersey City with Philadelphia. It has been pointed out that by degrees franchises have been obtained connecting Jersey City with Newark, thence by easy stages to Paterson, Elizabeth, and even to Trenton. The Philadelphia syndicate is reaching out toward Trenton, where the two roads are expected to combine. It is said that not less than $80,000,000 capital is behind the enterprise. From the principal line thus established spurs are contemplated reaching through every suburban village and town, making in fact, a huge gridiron of trolley lines through the state. It has been computed that the railroad privileges thus sought are worth fully $100,000,000.

TELEPHONE.

The Missouri, Kansas & Texas Telephone company will try the long distance telephone in sending messages as a substitute for the telegraph system.

TELEGRAPH.

South America and Africa have been joined by a new cable from Cape St. Augustin, Brazil, to the western extremity of Africa, the cable terminus at that point being near Cape Verde and the mouth of the river Senegal. The distance thus traversed is about 2,500 miles; and at the African station connection is made with the Spanish line by way of the Canary Islands to Cadiz and thus to all parts of Europe. Dispatches can now be sent from Pernambuco to Paris and London.

The survey for a cable from the shores of California to the Hawaiian Islands has resulted in a route being chosen starting from Monterey Bay to Honolulu, in preference to a route connecting Point Conception, Cal., and Hilo Bay, Hawaii, which was laid out by soundings by the steamer "Thetis," U. S. N., some time ago. The way selected will require the smallest length of wire and passes over an even bottom of soil favorable for the protection and preservation of the cable, avoiding submarine mountains.

POWER TRANSMISSION.

R. M. Jones has obtained a franchise to use the streets, alleys and highways of Salt Lake City, Utah, for poles, wires, pipes and conduits for the transmission of electricity from Big Cottonwood canyon.

Capitalists who are interested in an electric light plant in San Bernardino, Cal., have been at work for some months past on a project designed to supply the city of Los Angeles, Cal., with electric power for lighting the city, for use on the electric railways and for manufacturing purposes. Near the head waters of the San Gabriel river they have located a ditch and tunnel which develops, according to careful estimates, 3,000 horse power in a fall of 700 feet. By combining two streams it is estimated that 2,500 inches of water may be used and returned to the bed of the stream for the irrigators below. Negotiations are well under way for the disposal of the power.

MISCELLANEOUS.

At the meeting of the stockholders of the E. W. Bliss Manufacturing company, Brooklyn, held recently, it was decided to increase the capital stock of the company. The stock is now $1,000,000 preferred, and $1,000,000 common stock. The object of the increase in the stock was to take up the English bonds of the company and to reduce the large expenses of keeping an English agency for the company. The stock of the company is now almost entirely in the hands of local investors.

TRADE NEWS.

The Sperry Electric Railway, company, Cleveland, O., has issued a little book descriptive of its line of work. The company has introduced some novel ideas in the construction of its apparatus and these are here fully described and illustrated. Useful tables and instructions complete a book which will prove of profit and interest to those who are associated with electric railway construction.

The Electric Heat Alarm company, Boston, Mass., is distributing its latest catalogue. In it is described its automatic fire alarm system for hotels, calling attention in the office to the room in which the fire may be located. The company's exhibit at the World's Fair is attracting considerable interest, and it has no reason to complain of lack of attention.

The Ansonia Electric company has recently published a little circular describing the Wirt dimming switch, which is a great convenience in a bedroom or nursery for dimming the light. The company reports a large sale in the last month of Habirshaw wire, and also announces that it has closed a contract for upward of forty miles of shield brand wire for lighting and power work.

The *Architects' Electrical Bulletin*, New York, is devoting considerable attention to the task of advancing practical knowledge of electric light wiring among architects. It believes that there are many architects who have not devoted enough time and thought to wiring requirements. Hoping to remedy this to a certain extent, it makes a proposition to the profession declaring its willingness to establish a department for the purpose of drawing up wiring specifications. If architects will send their plans to the company, with the location of the outlets and lights marked, the new department will go over the plans, lay out the conduit system and draw a full specification for the wiring in question free of expense. Another advantage this offers, in addition to the specifications themselves, is the fact that it will enable patrons to obtain the benefit of all improvements that are made from time to time, and that cannot be brought before the public for some months after adoption in New York and other large cities.

If, as the American Silk Manufacturing company states in one of its circulars, "every new invention has to overcome prejudice, established customs and adopted habits," it may be safely inferred that this company will rapidly overcome such obstacles. Already it has been found necessary to warn the public of an attempt at imitation. The American Silk Manufacturing company's machine wipers are made of pure raw silk waste, strongly woven and warranted to last for a long time. Imitation wipers, which are not so durable and are spontaneously combustible, are on the market and must not be confounded with the original article. The factory of the company has been removed from St. Louis, Mo., to Bucks county, Pa., where excellent facilities for manufacturing and transportation were obtainable.

The General Electric company has issued a finely executed folder to be used especially in connection with its exhibit at the World's Fair. It has forty-nine descriptive illustrations showing some of the more important appliances which the company manufactures. It also shows the illuminations and decorative lighting at the fair including many buildings, McMonnie's fountains, the basin and electric fountains, search-lights and applications of electricity to many branches of business. The showing of the first incandescent central station in comparison with one 11 years later illustrates the immense growth of this branch of the business. The folder is a very attractive piece of work and much credit is due to Luther Stieringer who gave the ideas, and J. McGhie for the careful compiling and pleasing arrangement of the matter, while the handsome designs and press work are from Bartlett & Co.

BUSINESS.

The Ansonia Electric company, Chicago, is pushing the Stanley transformer with sufficient energy to make it a noteworthy success. Another specialty that the company evidently intends shall be kept before the public is the W. W. lightning arrester. Both these articles are in wide use, and the company is constantly receiving flattering testimonials as to their efficiency.

The Manhattan Electric Supply company, 36 Cortlandt street, New York, is making a special feature of its telephones. Already the expected results of the expiration of the Bell telephone patent has been the cause for unusual activity in the telephone branch of the electrical supply business, and the Manhattan company is one of the first to solicit orders for delivery after January 30, 1894, when the patent broadly covering a telephone receiver expires.

One who would see the beautiful, unique and practical in arc lamps and fixtures should consult catalogue No. 1 of the General Incandescent Arc Light company, New York. This company has established a well-deserved reputation for progressiveness and the numerous additions to its previous circular will be seen at a glance. It may be safely taken for granted that the company will not cease to make improvements in details and that success will attend it proportionately in the future as in the past.

Queen & Co., incorporated, Philadelphia, report a large stock of "magnetic vane" ammeters and volt meters which they can ship promptly and are pushing with great vigor. These instruments combine qualities highly essential for switchboard use and which render them specially valuable for isolated plants. A number have been shipped to exhibiting companies for installations at the World's Fair, and the makers have a handsome collection in their own display. The Acme portable testing set has met with favor wherever shown and is sure to become popular for general testing.

The Electrical Engineering & Supply company will, on July 1st, have removed its entire stock and business from St. Paul to Minneapolis, and will be located in commodious quarters at 249 Second avenue south. The name of the company will be shortened for convenience and called the Electrical Engineering company. Its new headquarters being much larger than at present it will have every facility for handling supplies with great promptness, and will also furnish factory facilities for the Northwestern Packard Lamp company, whose entire output, a capacity for at least 1,000 lamps per day, will be handled exclusively by the Electrical Engineering company.

The Electric Appliance company is offering two new attractions in the incandescent lamp business. One is a lamp of lower candle power than heretofore usual and the other a lamp of higher candle power than has as yet been produced. The first is its 6 candle power lamp made to fit any regular socket and burn on regular circuits with the filament at the incandescence of an ordinary 16 candle power lamp. The improvement in the other direction is in an incandescent lamp up to 1000 candle power and of a very high efficiency. The Electric Appliance company hopes very shortly to have one of these thousand candle power lamps burning in its World's Fair exhibit. These lamps are the Packard lamps manufactured by the New York & Ohio company for whom the Electric Appliance company is the western agent. From the interest that is being manifested in the new lamps the manufacturer has reason to believe that they will soon be in extensive use.

ELECTRICAL PATENTS.

Issued June 13, 1893.

499,253. Process of Magnetic Separation and Apparatus Therefor. Richard H. Sanders and Charles T. Thompson, Philadelphia, Pa.

499,261. Burglar Alarm System. Alfred Stromberg, Chicago, Ill.

499,270. Safety Support for Trolley Wires. Hiram K. Whitner, Chicago, Ill.

499,275. Safety Device for Systems of Distribution. Herbert C. Wirt, Boston, Mass.

The safety device is particularly designed for high tension systems, as, for example, alternating current transformer systems. At a point of the armature of the generator, midway electrically between the terminals of the machine, a connection is made from the coils to a third collecting ring, whose brush is permanently connected to ground. Thus, when the line is grounded through the body, the current that traverses the body will have only half the potential of the machine.

499,277. Method of and Apparatus for Uniting Metals. John H. Bassler, Myerstown, Pa.

The method consists in placing a fillet of aluminum or aluminum alloy in the joint of the materials to be united, and then passing an electric current through the materials and through the fillet transversely of the joint until the fillet is fused.

499,297. Electric Gas Lighting Apparatus. Thomas W. Lane, Boston, Mass., and Charles E. Lee, Chicago, Ill.

499,298. Electric Gas Lighting Apparatus. Thomas W. Lane, Boston, Mass.

499,305. Electric Bell. John L. Moore, New York, N. Y.

499,313. Electrical Measuring Instrument. Edward Weston, Newark, N. J.

499,321. System of Propelling Canal Boats by Electricity. Samuel W. Gear, Buffalo, N. Y.

A conducting wire is supported over the waterway, and so arranged that it may readily be shifted laterally in accordance with the lateral movement of the boat.

499,363. Electric Switch. James F. McElroy, Albany, N. Y.

499,370. Phonograph. William Bruening, East Orange, N. J.

499,374. Conduit Electric Railway. William R. De Voe, Shreveport, La.

499,411. Electric Signaling Apparatus for Elevators. Charles G. Armstrong, Chicago, Ill.

499,425. Strong Current Protector. Charles D. Haskins, Brooklyn, N. Y.

499,428. Electric Hinge. William S. Hull, Sheffield, Ala.

499,446. Alternating Current Generator. William Stanley, Jr., and John F. Kelly, Pittsfield, Mass.

499,461. Overhead Trolley Wire Switch. Rudolph M. Hunter, Philadelphia, Pa.

499,473. Electric Light. Gaston Sautter, Paris, France.

499,485. Relay Fuse Block. Gardner T. Voorhees, Boston, Mass.

499,518. Method of Electrically Welding Metals. Charles L. Coffin, Detroit, Mich.

499,543. Electro-magnetic Car Brake. John C. Henry, Westfield, N. J.

One of the axles on each car is supplied with a combined dynamo and magnetic clutch. Ordinarily no current is generated by the dynamo, but, by closing the circuit across the dynamo terminals, either automatically or mechanically, the generator induces an alternating current which excites powerful magnets that operate the magnetic clutch, thereby causing a drum, normally loose on the axle, to wind up the brake chain.

499,544. Regulator for Electric Machines. John C. Henry, Westfield, N. J.

The regulator is adapted to shift the brushes upon the commutator to vary the potential of the machine and maintain the current strength constant. To the armature shaft is attached a disc of magnetic material, which is adapted to rotate between the poles of an electro-magnet, which is supported upon a pivot. The pivoted electro-magnet is connected by levers with the brush carrier, so that by its rotation it shifts the brushes upon the commutator. The coils of the electro-magnet are in series with the working circuit, and any increase in the strength of the current causes an increased attraction upon the rotating disc, thus moving the pivoted magnet upon its pivot and shifting the brushes to a position where the potential of the machine is lessened.

499,596. Electric Igniting Device. William H. Russell and George E. Russell, Jersey City, N. J.

499,610. Recorder. John T. Todd, Chicago, Ill.

499,614. Multiple Fuse Block. Gardner T. Voorhees, Boston, Mass.

499,633. Gearing for Electric Railway Cars. John C. Henry, New York, N. Y.

499,646. Switch. George W. Russell, Jr., Denver, Colo.

499,657. Method of and Apparatus for Electrically Welding Sheet Metal. Charles L. Coffin, Detroit, Mich.

499,662. Trolley Wire Hanger. Charles B. Elliott, Boston, Mass.

499,664. Electric Fuse Block. Thomas J. Fay, New York, N. Y.

499,676. Electric Arc Lamp. Rudolph M. Hunter, Philadelphia, Pa.

The lamp is adapted to burn several pairs of carbons successively. The lower carbons occupy parallel positions, while the upper carbons, supported by the same carbon rod, occupy positions so parallel that but one of the carbons may come in line with the other member of the pair at a time. Lifting and regulating mechanism is provided whereby the arc is established and maintained between one of the pairs until the arc becomes extinguished, when the carbon rod is lifted and rotated until the members of the second pair are brought into line, after which the arc is established and maintained between the latter pair.

499,681. Electro-magnetic Blanket. Nils A. Renstrom, Omaha, Neb.

499,693. System of Wiring Multiple Switchboards. Charles H. Wilson, Chicago, Ill.

The cables connected with the various spring-jack switches are located at the back of the board, and supported upon horizontal pins or arms. In order that any strip of spring-jacks may be readily withdrawn from the board slack is provided in each cable by running the cables in sinuous lines, the conducting wires extending to the switches, leaving the cables at those portions of the cable lying nearest the board, so that when the strip of switches connected therewith is withdrawn from the board sufficient slack cable is provided to permit the withdrawal to the rear of the mass of cables.

THE "CLARK" WIRE.

TRADE MARK.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, he says: "A thoroughly reliable and desirable Wire in every respect"

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use, we make all sizes of stranded and flexible with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

Boston Electric Company,

548 Washington St., Boston,

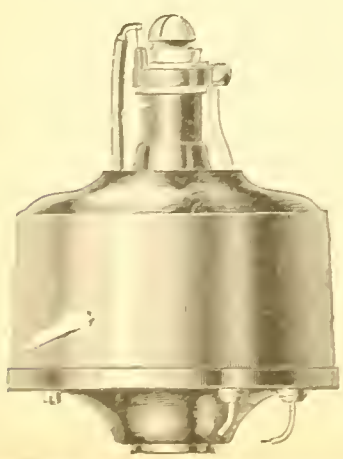
MANUFACTURERS OF THE

Original Celebrated Boston Burners.

HEADQUARTERS FOR

GAS LIGHTING APPARATUS.

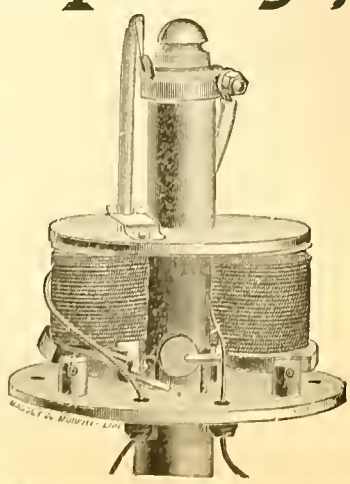
Please do not confuse our name with others.



Boston Electric Co.'s Automatic Burner.

We have the largest and most complete stock of Gas Lighting apparatus to be found in this country. Our burners have proven, by practical use, to be far superior to any others on the market, and our prices are exceedingly low.

Buy burners made by the BOSTON ELECTRIC CO., and get the best. You will thereby save the profits of your labor, besides giving your customers perfect satisfaction.



Boston Electric Automatic Burner (shell removed.)

YOU NEED THESE BOOKS.

NEW
DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

226 Pages. 138 Engravings.

PRICE, $1.00.

INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

72 Pages. 42 Illustrations.

PRICE, $1.00.

BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

PRICE, $1.00.

ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

PRICE, $1.00.

STREET RAILWAYS.
"TRAMS."
Their Construction, Operation and Maintenance.
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

500 Pages. Profusely Illustrated.

PRICE, $4.00.

DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

PRICE, $9.00.

DICTIONARY ... OF ... ELECTRICAL WORDS,
TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

700 Pages. 750 Illustrations.

PRICE, $5.00.

THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

PRICE, $3.00.

THE PRACTICAL MANAGEMENT OF DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

PRICE, $1.00.

ELECTRIC LIGHT SPECIFICATIONS
FOR THE USE OF
Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

176 Pages.

PRICE, $1.50.

THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

400 Pages. Profusely Illustrated.

PRICE, $2.50.

HIGH POTENTIAL AND HIGH FREQUENCY.
Experiments with Alternate Currents.
By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

PRICE, $1.00.

THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

PRICE, $1.50.

SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

16 mo. Boards.

PROFUSELY ILLUSTRATED.

Price, 50c. Each.

STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

PRICE, $3.00.

Any of the above books sent promptly, postage prepaid, on receipt of price.

Receiver's Sale of Street Railway

At Milwaukee, Wisconsin.

Notice is hereby given that in pursuance of an order of the Circuit Court of Milwaukee County, Wisconsin, I will, on the 30th day of June A. D. 1893, at eleven o'clock in the forenoon of said day, at the south door of the Court House in the city and county of Milwaukee, Wisconsin, offer for sale and sell at public auction as an entirety, the street railway of the Milwaukee Electric Railway Company in said city of Milwaukee, with all the franchises and rights and privileges of said railway company for the operation and maintenance of the same, and all the property of said corporation used in or in connection with, or essential to the exercise of its said franchises.

Said railway property and franchises consist of about 6½ miles of double track, being about 13 miles of single track, in said city of Milwaukee, with all the poles, wires, cables, trucks, ties, stringers, fixtures and appliances composing or used in connection with said tracks or said railway, with franchises, privileges and rights derived from ordinances of the common council of the city of Milwaukee to maintain and operate said road; also sundry parcels of real estate in said city, with car barns and power house thereon; also the engines, boilers, machinery and rolling stock and supplies of said road.

The terms of such sale are cash.

The said street railway will be sold free of all liens and encumbrances except judgments of foreclosure and sales aggregating $21,193.56, with interest from the 23d day of November, 1892, at 7 per cent. on $1,259.60 thereof, and at 6 per cent. per annum on the remainder. Said judgments of foreclosure covering the said specific parcels of real estate.

Dated Milwaukee, Wis., Feb. 27, 1893.

C. J. MELMS,
Receiver of the Milwaukee Electric Railway Company.

TESTING INSTRUMENTS.

Special prices on application, on testing instruments illustrated on pages 253 to 274 of our August '92 Catalogue.

WESTERN ELECTRIC COMPANY,

CHICAGO and NEW YORK.

ELECTRICITY FOR ENGINEERS.

Part I, 268 Pages, $2.00. **Part II, 156 Pages, $1.00.**

WHEN ORDERED TOGETHER PRICE IS $2.50.

Both Works Profusely Illustrated.

☛ Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

PART I.—CONTENTS.

CHAPTER I.

Electricity—Positive and Negative—Conductors, Non-Conductors and Insulators — Electro-Motive Force — Volts—Resistance—Ohms—Current—Amperes.

CHAPTER II.

Dynamos—Magnets—Field Coils—Electro Magnets—Permanent Magnets.

CHAPTER III.

Armatures, Construction of, Different Kinds of—Commutators, How Made and Connected—Heating of Armatures—Eddy Currents.

CHAPTER IV.

The Current—How Produced—Induction—Series Wound Dynamos—Shunt Wound Dynamos—Exciting the Fields—Constant Current and Constant Potential Dynamos—Series and Parallel—Parallel or Multiple Arc System.

CHAPTER V.

Incandescent Lamps — Filaments — Connections — Flashing—Exhausting—Testing—Candle Power—Operated in Series—Automatic Cut-Out—In Multiple Arc or Parallel—Multiple Series—Multiple Series Cut-Out—Three Wire System.

CHAPTER VI.

The Arc Light—How Formed—Causes of Unsteadiness—Remedy—Effect of Shades or Globes—Shape of Carbons under Different Conditions of Burning—Arc Lamps—Regulating and Cut-Out Mechanism—Action of Current—Clutch Lamps—Clockwork Lamps—Double Lamps—Troubles in Lamps.

CHAPTER VII.

Commutators and Brushes—The Brush Commutators — Brushes — Different Styles of Brushes — Double Brushes—Single Brushes — Troubles with Commutators and Brushes — Correct Position of Brushes—Sparking at Brushes — Care of Brushes and Commutators — Flashing.

CHAPTER VIII.

Current Regulation—Hand Regulation—By Position of Brushes—Resistance Box—Resistance Coils.

CHAPTER IX.

American System of Automatic Current Regulation—The Dynamo—Regulator—Action of Regulator.

CHAPTER X.

Brush System of Automatic Current Regulation—Brush Armature—Diagram of Circuits through Dynamo, Regulator and Lamps—Dial or Regulator—Care and Adjustment of Dial—Dial Controller—Circuits and Connections of No. 8 Brush Dynamo—Circuits of Compound Wound Constant Potential Brush Dynamo.

CHAPTER XI.

The Edison System—Automatic Regulator—Circuits of Regulator—Circuits of Dynamo—Action of Regulator—Howell Pressure Indicator—Diagram of Circuits—Description of Parts and Operation.

CHAPTER XII.

Excelsior System of Automatic Current Regulation—Dynamo—Armature—Diagram of Circuits—The Regulator and Motor—Action of Regulator.

CHAPTER XIII.

Schuyler System of Automatic Current Regulation—Dynamo—Armature, Commutator and Brushes—Diagram of Circuits in Armature and Field—Regulator—Circuits in Regulator.

CHAPTER XIV.

Thomson-Houston System of Automatic Current Regulation—Dynamo—Armature—Commutator and Brushes—Controlling Magnet—Wall Controller—Diagram of Circuits—Air Blast.

CHAPTER XV.

Waterhouse System of Three-Brush Automatic Current Regulation — Dynamo — Extra Brush — Resistance Coils and Regulator.

CHAPTER XVI.

Ampere Meters—Tangential Scale—Solenoid Meters.

CHAPTER XVII.

Voltmeters—Pressure and Potential Indicators.

CHAPTER XVIII.

Testing—Galvanometers—Astatic Needle—Differential Apparatus.

CHAPTER XIX.

Wheatstone Bridge or Electrical Balance—Diagram of Circuits and Methods of Use—Bridge and Rheostat—Round Form—Square Form.

CHAPTER XX.

The Magneto as a Testing Instrument—Armature—Field—Bell—Diagram of Circuits.

CHAPTER XXI.

Coupling Dynamos Together—In Series—In Shunt—Series, Shunt and Compound Wound Machines.

CHAPTER XXII.

Switches and Switchboards—Loop Switch—Plug and Socket—Change over Plug and Socket—Conclusion.

CHAPTER XXIII.

Electric Motors, General Principles the Same as in Dynamos—Types—Shunt and Series Motors Suitable for all General Purposes—Regulation of Shunt Motors—Of Series Motors—Counter E. M. F.—Direction of Rotation and Direction of Current—Starting Motors—Diagram of Connection.

PART II.—CONTENTS.

CHAPTER I.

Alternate Current Dynamos—Principles of the Field—Field Current Armature—Winding—Connections—Lamination—Different Types of Alternators—Regulation—Leading Systems—The Brush Generators—Magnets—Armature—Principles of Induction.

CHAPTER II.

Dynamos, Continued—The Mordey Alternator—Stationary Armatures—Field Magnets—Ferranti Armature—Field Magnets—Winding—Collectors.

CHAPTER III.

Dynamos, Concluded—Siemens Dynamo—Best Magnetic Circuits—Stanley Constant Current Dynamo—The Armature—Self Induction—Regulation.

CHAPTER IV.

Induction Coils—Converters—Transformers—Economy of Distribution—An Electrical H. P.—Losses in Conductor—Induction Coils—Effect of Induction—Transformers.

CHAPTER V.

Transformers, Continued—Induction Coils—Converters—Transforming Up and Down—Design of Transformers—The Static Charge—Protection Against—Grounding the Secondary—Other Devices—The Foil Protector—Different Types of Transformers.

CHAPTER VI.

Transformers, Concluded — Fuses — Regulation — Winding of Transformers—Connecting to Circuit—Regulation—Safety Fuses.

CHAPTER VII.

Parallel System—Series Arc Light System—Diagram of Circuits—Parallel System—Primary Circuit—Secondary Circuit—Placing of Transformers — Fuses—Diagram of Series Arc Light Circuit.

CHAPTER VIII.

Lines of Force—Hysteresis—Magnetic Penetration—The Circuit of Lines of Force—Experiments with a Magnet—Rapidity of Reversals and Hysteresis.

CHAPTER IX.

Arc Lamps—In Series—The Westinghouse Arc Lamp—Diagram of Circuits in Lamp—Action of the Mechanism—Flat Carbons.

CHAPTER X.

Arc Lamps, in Multiple—Slattery Differential Lamp—Mechanism of Lamp—Its Operation.

CHAPTER XI.

Measuring and Indicating Apparatus—Instruments for use with Alternating Currents Differ from those used with Continuous Currents—Ammeters—Voltmeters—Description of Several Forms of Instruments.

CHAPTER XII.

Measuring Instruments, Continued—Hot Wire Instruments—The Cardew Voltmeter—Details of the Instrument—Low Potential Voltmeter.

CHAPTER XIII.

Voltmeters—Double Coil Voltmeter—Two Types.

CHAPTER XIV.

Spring Meters—Curled Spring Meter.

CHAPTER XV.

Twisted Strip Instruments—Diagram of Connections and Operation of Instrument.

CHAPTER XVI.

Recording Meters—Stanley Meter—Construction and Principles of Operation — Diagrams of Parts—Slattery Induction Meter—Description of Parts and Principles of Operation—Watt Meter—Thomson Meter.

CHAPTER XVII.

Generators in Parallel—Difficulties in Operating—Alternate Current Generators in Parallel—Arrangements of Circuits and Machines for Operating in Parallel—Diagram of Common Arrangement of Machines and Circuits.

CHAPTER XVIII.

Ohm's Law—Strength of Current—Formulas and Examples—Power and Heating Effects of Currents.

CHAPTER XIX.

Ground Alarms and Leak Detectors.

Orders Promptly Filled on Receipt of Price. POSTAGE PREPAID.

Redding Electric Co.,
336 CONGRESS ST.,
Boston, Mass.

WE DESIRE TO ANNOUNCE that we have added to our business a department of

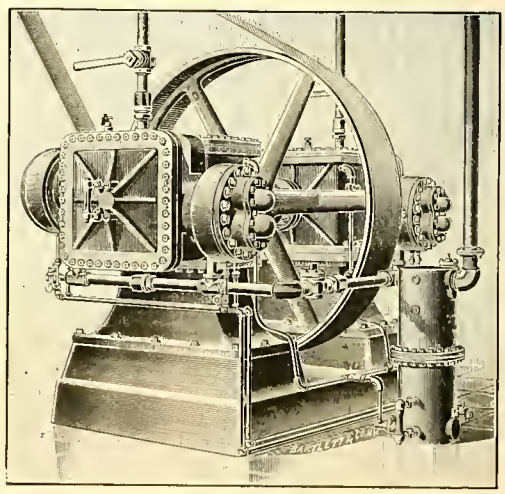
Ice Making and Refrigeration

in which field we recognize a demand for as high-class Engineering as we have been accustomed to give to the construction of Steam Power Plants. This department is distinct in its organization, with headquarters at our Boston Office, 620 Atlantic Avenue, under the immediate management of Mr. Church, with Frederick E. Murphy in executive authority as Engineer in charge.

After an investigation covering a period of two years, and conducted in the interests of our own proposed investment, we have acquired control, by Exclusive License, of the Compressor and Condenser patented by Messrs. Hodges and Havenstrite, of Boston. Staking our reputation as judges of successful machinery, we offer them as the most mechanical, adaptable and economical apparatus for the purpose, thus far placed on the market.

The proportioning and construction of the distribution system, on which the successful working of both Ice-making and Refrigerating plants so largely depends, will be carried out consistently with the reputation for good engineering and good work which we enjoy.

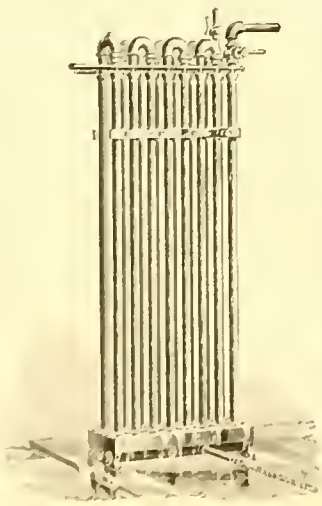
We are now prepared to contract for Plants for the manufacture of



ARTIFICIAL ICE

having any capacity from one-half ton to one hundred tons per day and upward. Artificial Ice has come to stay, equally for sanitary and economic reasons, and its manufacture is a stable and profitable enterprise, competing successfully against the natural product.

ARTIFICIAL REFRIGERATION



will receive our especial attention. In cold Storage Warehouses, Breweries, Packing Houses, and similar large industries, it is already an established necessity. Into this class of plants we bring for the first time the manifest advantages of small space and headroom, and the subdivision of units, which last is the only means whereby a Refrigerating Plant can meet the fluctuation of the seasons with anything like uniform efficiency.

Refrigeration or combined Refrigeration and Ice-making, in small plants from one-half ton to ten tons per day, is now cheap and practicable, and this particular trade will be fully developed by us in its application to Markets, Creameries, Hotels, Apartment Houses, Hospitals, and Manufacturing processes of all kinds. In this latter field, we believe ourselves without successful competition.

Correspondence regarding any application of Artificial Cold will be to the mutual advantage of our customers and ourselves.

Very respectfully,

WESTINGHOUSE, CHURCH, KERR & CO.,
ENGINEERS,
